HARPER'S NEW MONTHLY MAGAZINE.

No. CCLXXXIX.—JUNE, 1874.—VOL. XLIX.

OUR NEAREST NEIGHBOR.

[First Paper.]

PYRAMID OF CHOLULA.

THE nearest things are often the farthest off, and the farthest off the nearest. This is true of places as well as of peoples. We know more of Bismarck than of our next-block neighbor, of Paris than of many an American town. This law is verified in our knowledge, or ignorance rather, of our nearest national neighbor, Mexico. Few books are written, less are read, upon this most novel and interesting land on our continent, and one of the most attractive on any continent. Prescott's *Conquest* is esteemed a sort of historical romance, the very charm of his style adding to the unreality of his theme. And if it be reckoned strict history, it is still history; not a living, breathing power, as is England or Italy, Germany or Russia, but a vivid fact of three centuries

and over ago, a mediæval story of marvels and mystery. In fact, Prescott's "*Conquest*" has made that of its subject, Cortez, to fade. And one is half tempted to believe that the real conquistador was not the strong-brained, strong-limbed, strong-souled Spaniard, but the half-blind and wholly meditative Bostonian. The Achilles and his Homer are worthy of their several fame. Yet the land on which, or out of which, each won his chief glory is still superior to them both. A run along some of its chief paths of interest may make this fact patent to other eyes.

The approach to Mexico is on the same path to-day that Cortez opened. He made its port, and all people have accepted his decision as final. Attempts have been made to erect other coast towns into the chief

Entered according to Act of Congress, in the year 1874, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.

VOL. XLIX.—No. 289.—1

GOVERNOR'S PALACE OF VERA CRUZ.

ports of entry, but so far have utterly failed. The City of the True Cross, built on the hot sands by this adventurer, is the commercial capital still. If all the centre of the country is largely Mexican, the city of Cortez is Spanish to this day. Not in population, for the Indian excels in numbers here as every where in the country, but in influence and character it is a child of Spain.

Look at it as you draw in sight of the wished-for land, especially if a norther has been tossing you on those green, blue, black, and yellow waves, the strata of earth or of herbage under the sea giving its coloring to the waves rolling above them. There rises the grandest of peaks that ever saluted a coming or going traveler. Sixty miles at sea, the mighty cone of Orizaba lifts its white pyramid, glowing like a cloud smitten by the sun, yet fixed and solid in its substance, and light as no cloud can ever be. Though it is eighty miles back of the shore, it seems almost to stand out to sea, so vast are its proportions. Nowhere else can a cone of snow be seen so clear and so near from the ocean level. You can measure from this watery plain the whole enormous height. Over seventeen thousand feet it stands forth in one unbroken eye-glance. It looks as broad as half the western horizon. All that broken group of brown and green mountains forms its base, but from their centre, as if gathering all their voluminous folds into one, it rises fourteen thousand feet,

sheer and unbroken, without a mountain companion. From the sea the effect is felt of the whole four miles of height. You measure from that green below you to that white above, and take in the whole impression at once.

But Orizaba can not keep us from nearer and more human views. A little island lies a mile or two from the shore. A bank runs half-way out to the island. Only a small channel separates the two, which could be easily connected by a breakwater, if wisdom, will, and wealth could unite in the enterprise. The island is the famed fortress of Ulloa, not so named from the ululations of its occupants, although they have suffered successive defeat from every attacking foe.

Behind it, and between it and that spit of land, is the harbor, what there is of it, of Vera Cruz. And not much of a harbor is it. The northers drive their seas clean over the solitary mole, and the few craft that lie near hasten to up anchor if possible, and get into the outer and safer sea. If such a sea happens to be on, there is no communication between vessel and shore, not even between the fort and the main-land. Passengers have been kept a week in a steamer, unable to land, and friends visiting the ship, or passengers the shore, have failed for days to make their desired connections with the mole or vessel. Our luck is better, as we arrive on the dying edge of a storm, and soon find ourselves in an officer's boat, un-

YERBA CRUZ.

der white awnings, rowing to the mole. At the head of this solitary wharf an open plaza, without shade of any sort, welcomes us, famous chiefly as the spot where Santa Anna lost his leg in some gunnery practice against a home or foreign foe. That lost leg helped him on to fame and power as completely as the famous cork leg pushed forward its fortunate (for a time) possessor. Hosea Biglow's wooden leg of Bird o' Freedom Sawin was an equally fortunate limb of Fortunatus.

A short street, clean and white, as all the streets are here, brings us to the little central plaza, and its tiny park of perpetual verdure. The Australian gum-tree, the magnolia, the Chinese laurel, broad-leaved cacti, and lilies of many sorts, cool the fervid air by their dark and glossy greens. Even the flaming flower of the oleander can not make them look uncomfortable.

The Hotel Diligencias occupies one side of the square, a name known and respected over all the country, for it is the house of the company which is the only substitute for the railway from Yucatan to Colorado. Every where the Diligencias Generales is found, and every where it insures you good coaches, good beds, good board, good horses, good drivers—every thing but good roads. This company was formed only a few years ago, chiefly by Señor Escandron, who saw the need of this intercommunication, and who became enormously wealthy by his sagacity and enterprise. It issues letters of credit on deposits, and has administrators at every stopping-place for the night, who will cash these letters according to the traveler's desire, and so keep him in constant relief, without imperiling his life and fortunes by carrying large sums about his person.

Opposite the hotel is the governor's palace, a building of some pretensions, two-storied, with ample halls and broad verandas and many suits of rooms. It was then being tinted with pretty washes without, and cleaned and garnished within, because the President was on his way to open the railroad from the commercial to the national capital. The cathedral, big and not beautiful, ranges along the southern side, and stores, chiefly occupied by Germans, stretch coolingly under the arcades on the northern side. Sippers of coffee sit under the arches before the hotel, and a few loungers dodge away from the sun around the plaza, shifting themselves to its shadiest benches.

Vera Cruz is the smallest, compactest, cleanest, and deadliest of national sea-ports. It lies in the hollow of your hand. It has practically but two streets, one going straight back from the mole to the centre of the wall that swings like a semicircle around the town; the other is the string of this bow, whereof the former is the arrow. It stretches along its diameter the enormous distance

of about a mile. The arrow is about a third that length. Two or three streets cross this at right angles going from the Gulf to the wall, and two others are parallel to Central Street, as it is called, but behind it, and shorter, subtending arcs of lesser area. What makes the city such a victim of the yellow fever is a question often asked and rarely answered. It is not its filthiness, for a cleaner town one never sees. Its block-stone pavements are washed nightly, and shine like Philadelphia door-steps. The big black buzzard acts as scavenger, and clouds of them occupy roof-top and church cross, dipping into the street for stray morsels, and in their ravenous hunger would make nothing of boots and hats and old clothes, if the people ever had such articles to cast away. So far as garbage and dirt are concerned, no city has less fault to find with its fathers.

No more is the affluent and decaying vegetation the cause, or quiet inland waters and semi-waters, such as lie in lagoons and rich but deadly deltas about New Orleans. The bluffs about Vera Cruz are sand, and sand only. You must go miles from the city to reach fat and fatal lands. The walls are thought to be the chief source of the evil, for they shut in the air, and prevent its sweeping easily through the town. They are twenty feet high, and of no value whatever as a protection. They only increase its perils, for they necessitate bombardment in all civil wars, which ruins roofs and churches and destroys lives, while they do not prevent the capture of the town. If they also cause the pestilence, then there is every reason for their removal.

Central Street has one characteristic of Venice. It is without carriages. Not a four-wheeled, or a two-wheeled, or even a one-wheeled vehicle did I see in all its tiny thoroughfares. The horse and its rider, the donkey and its pack, were the only representatives of carts and carriages, except the Indian loaded like his brother, the ass, with burdens grievous to be borne. The levees of the great are attended by gentlemen and ladies on foot. Even to the Presidential reception, which flashed with diamonds and grand turn-outs of apparel, every body went afoot. But Venice is without horse or mule, and so Vera Cruz hath pre-eminence.

In another thing it surpasses. Without public or private carriages, strangely enough it has a horse-car. I shall have to revise my first statement. This four-wheeled car exists. It goes up and down this single avenue every fifteen minutes, and will carry you for a real (twelve and a half cents) the whole distance of a mile, or less. But it carries nobody save driver and conductor. People have no call to either extreme, and the shops, cafés, and churches are all within biscuit toss of each other and of the houses

FOUNTAIN AT VERA CRUZ.

of the gentry, the very few that have a real to spend. The horse railway, like many a Northern steam road, is simply a superfluity, no call arising in either case for the extravagant enterprise. It may by this time have ceased to be.

The prettiest ride from the city is by cars to Medellin, some ten miles south, a little back from the sea, along the bank of a muddy and shaded river. This was the favorite resort of Cortez, and it bears the name of his birth-place over the sea. We pass down Calle Centrale by many a workshop and wine-shop. In the former you see tailors, hatters, cordage-twisters, candle-makers, shoe-makers, iron-workers, each busy at his hot trade this hot December day. There is no privacy. All their works are manifest to all passers-by.

The wine and coffee shops are equally open, and more attractive. Hot to the hot is the law, whether it be delicious coffee or fiery spirits. Ice-water and iced drinks are things unknown. What the acute Hazewell, of the *Boston Traveller*, asserts should be our law of conforming to nature, ice-water for winter and tea for summer, is here carried out, and the heating liquids refresh heated frames.

A church, well battered by the shot of Scott, stands near the southern gate, rent and abandoned. A bridge is just outside the gate, perhaps thirty feet long, stone, with a low parapet, and benches for loun-

gers. The broad path to it on either side for a hundred feet is lined with young cocoa-nut trees. That bridge was first built by Cortez for a sum so fabulous that his emperor staggered when the bills came in. It is of no use except as a lounging-place, and not much for that, for the trees are too small, the promenade too short, and the means of getting to it too scant for the fashionables to frequent it, even if the horse-car runs thither; so it is left to dogs and loungers of the lower sort, or, more commonly, to silence and emptiness, save the croaking presence of buzzards, and the stray foot of the foreigner "doing" the town.

The cars for Medellin start from near Cortez Bridge and its petty alameda. They run through a wild, rough, low country, well covered with thorns and briars, sometimes marshy and watery, where the July pond-lily of the North is sending forth its December fragrance, or would, if it sent forth any fragrance at all, which it is said not to do in this land. It looks as sweet, if it does not smell as sweet, as when nestling in the mid-summer ponds of New England.

Alongside of the road for "quite a piece" runs a sort of water-dike. Horsemen are wending their way to the town, for it is Saint Somebody's day, and so every non-saint must off work and on toggerly, and be up to the drink shops for a godly carousal. One of these caparisoned horsemen, well bedizened with rows of shining buttons all adown

the sides of his pantaloons, with like rows on either side of his dark jacket, upon a horse alike arrayed, seeks to get out of too near proximity to the train, backs off the narrow roadway into the canal-like sludge, and horse and rider go floundering in mud and water, to the immense delight of spectator and disgust of the victim. The bemired costume is a poor preparation for his day's expectations.

The cocoa-palm begins to assume lofty proportions, its bark seamed and ridged with the annual fall of its leaf: a fall not like that of most trees, for its leaf grows out of its trunk, rises high and stiff as a branch, ripens, withers, falls backward over itself, drops off little by little, until naught remains but the scar, a rim of green and then of brown, which shows its successive annual growths, as rings inside the bark do those of other trees.

Medellin is a collection of bamboo huts and cottages of varied pretension, situated amidst rose-bushes laden with flowers, orange groves laden with fruit, and mango and acacia trees of height and breadth and foliage and greenness beyond compare. These bamboo palaces are for coolness, and they look airy and comfortable. Most are deserted, except those the poorest inhabit, and the one or two still open for occasional parties from the town. It is out of season now, and so the shaded stores, cafés, and gambling-houses are without inhabitant. One pleasant restaurant is open. We pace its cool halls, sit in its cane seats, wander among its blooming gardens which lead to the river's bank, with its deep shade of refreshing coolness, and sit down to a delicious breakfast of fish, flesh, eggs, and coffee, with bread to match, no better than which can one find in the finest banqueting-room of Paris. It was a novel sensation this garden meal on New-Year's Day—a beginning of the year that New York visitors would be glad to enjoy.

The roses are fragrant if the lilies are not, and big bouquets for a penny or two are forced on you at the stopping-places. The people love flowers. The natives take delight in raising them, and show much taste in arranging them. The flower vendors of the capital are among its chief institutions. They occupy the corners of the street, their bouquets lying on mats on the ground. These bouquets are sometimes half a yard across; from that to half a foot. Their base is usually violets, crowded and solid and smooth, a dark background for the brilliant colors that crown them. Trimmed and scalloped paper incloses the flowers. They are sold for a few cents, if the customer knows how to buy.

The chief road from the sea-port to the capital formerly led through Jalapa, famous for its tropical gardens, its outlook of sea

MEXICAN FLOWER GIRL.

and its uplook of mountains; famous also for the nauseous jalap it has contributed to pharmacy, and for which it has fallen into such disrepute among children, and those who retain the memory of childhood, that its rare beauty of location and surroundings can not make it entirely agreeable. One does think of rose and sweetness at the same time, no matter what Shakspeare says; and if that word were united with an asafetidian odor, the very name of rose would cause an upward movement of its rhythmical fellow, the nose. So Jalapa suffers from its bad name. Yet if we pronounce it Halapa, and spell it thus, we escape the memory; for no one would think of finding in that name the horrid jalap of his sick boyhood.

The railroad has spoiled this road to the capital. It goes to the southward, making Cordova and Orizaba its half-way houses. For eighty miles it runs through a level, unsettled country, full of capabilities. The rank foliage of field and forest shows what it might be if reduced to cultivation. A few cattle occasionally appear, a hamlet or two by the road-side, orchards of bananas flourish and show off as a fruit in their own country, like all natives, appearing better at home than abroad. Orchids hang on the crotches of trees, having ate up all the foliage to make themselves beautiful. These fungi or parasites have their chief home along this valley. They are of every sort of color and quality, and as useless as flowers on a lady's hat, or three tails to any thing but a bashaw. Yet if beauty be its own utility, they have a right to be, for in rich and delicate tints they are above all their fellows of the field, these hanging gardens of dead trees.

Chiquihuite welcomes us to its cooling for-

ests, the beginning of the mountains. Orizaba had been haughtily glancing at us with his "stony British stare" all the way from Vera Cruz. The bottom of his hills began to hide from us his icy countenance. It was a luxurious exchange. Nowhere has nature piled up more magnificence in forest shape. The road winds on semicircular bridges amidst ash, beech, acacia, mango, castor-oil, cocoa-palm, and unnumbered varieties of forest and flower. The morning-glory, elaborated here into convolvuli, hangs on every bush and tree, a mass of tangled color of every hue. The hills hollow out a basin, into which, hundreds of feet below, leaps the Atoyac. It is a wide, high tunnel of densest foliage, with a tiny stream pouring from near its base into a darkling pool. You can go the world around and not find a more charming picture than this of Atoyac.

We plunge out of its sight, and all sight, into another sort of tunnel, and then debouch upon the plains of Orizaba, the first terrace, three thousand feet above the sea, half-way up to the capital.

This is an open plain, bounded by big mountains. For twenty miles the road runs on a comparative level, amidst wildness of nature and fields of culture. The huts of the villagers line the road-side, sometimes thirty feet in roof and not six feet at the eaves, loftiness within and lowliness without being their desiderata—a grace of nature that souls might safely imitate.

Paroquets chatter on their perches, loose of foot as well as tongue, held probably by the clipped wing, as strong a chain as any cage or fetter can be. The coffee bush hides itself among the banana thickets, craving shade with its heat. It is a slim, loose-jointed bush, that sprawls round like a tall ungainly boy who does not know what to do with his legs or arms. Its bean lies darkening on the mats around the cottages, the gathered and the ripened article differing greatly in color.

Cordova—not the ancient of Spain, but the hardly less ancient of Mexico—salutes us with cries of 'bus and carriages, as well as of oranges, bananas, and stranger if not better fruit. For a medio, or six and a quarter cents, they will give four such oranges as you never tasted elsewhere. The Jaffa, the Messina, the Neapolitan, the Havana, all lose their lusciousness beside the Cordovan. It overflows with juiciness. It can hardly wait to have its skin removed. It spurts out of the under skin, that type, modern antiresurrectionists might say, of the spiritual body hidden under the outer and grosser covering. It is pressed down, shaken together, and running over, is the orange of Cordova; and yet these United States try to squeeze life out of the fibrous Havana and sweetness out of the sour Messina, bringing the latter by heavy ship-loads across the Atlantic and half across the Mediterranean, when this queen of them all is not three days from

OLD BRIDGE OF ATOYAC.

A PEON'S HOUSE.

New Orleans. The old town looks old from the dépôt, though it is not of Aztec but of Spanish origin, one which Cortez built for his delight and repose, and which holds memorials of his presence as its chief heirlooms.

The preacher of a better faith is here also, preparing the way of the Lord and making these paths straight. It will be one of the loveliest appointments when the new gets well established, and the old gets well renewed.

In this hollow among the hills Orizaba puts on especial majesty. You are well up to its base. The distant ocean and sea-port view is exchanged for one near at hand. Though still sixty miles away, it seems to rise at your very feet. How superbly it lifts its shining cone into the shining heavens! Clouds had lingered about it on our way hither, touching now its top, now swinging round its sides. But here they are burned up, and only this

pinnacle of ice shoots up fourteen thousand feet before your amazed, uplifted eyes. Mont Blanc at Chamouni has no such solitariness of position, nor rounded perfection, nor rich surroundings. Every thing conspires to give this the chief place among the hills of earth. None these eyes have seen equals or approaches it in every feature. It will yet win the crowd from Europe to its grander shrine.

It is not difficult of ascent, in this being inferior to Europe's Mont Blanc, if that be an inferiority which makes its summit and the view therefrom accessible to ordinary daring.

The three Mexican volcanoes have been often under foot, though not till Cortez came was this achievement known. His men, in the exuberance of their superiority, scaled the peaks near the city, and astonished the natives by their feat. They brought back sulphur from the crater for the manufacture of powder, thus bringing the fatal mountain in more deadly shape home to the poor Aztec.

ORANGE GROVES IN CORDOVA.

Orizaba is not only a mountain, but a town. The last was reached by a coach from Fortin, then the terminus of the road. We plunged down a steep place, a race of the horses' heels with the coach's wheels as to which should touch bottom first. The heels touched bottom all the time, and of course reached the bottom of the hill ahead of the wheels, but only a length ahead. High along the side of this exceedingly steep hill creeps the railroad, making some of its most surprising feats of engineering as it winds and leaps across this chasm. It becomes almost circular in its twists and turns.

VIEW OF ORIZABA.

The ride down hill and then up again was amidst the richest tropical delights. There was no end of heavy, deep foliage, of thick-set banana orchards, of hide-and-go-seek coffee bushes and beans, of flaming rhododendron, and every shade of cactus blossom—if that can be called a shade which shone with such marvelous beauty. The uncomely parts hath the more abundant honor, one clearly sees, when such spined and gray and beardless forms glow with purple, scarlet, crimson, deep-hued pink, and grateful blue, yellow, and violet.

The town is entered, its street rough beyond conception. Great boulders lie thickly scattered over it, and greater holes lie beside the boulders, the former extinct paving-stones, the latter the holes of the pit whence they were digged. These were all once in proper symmetry, the stones compact, upon a level road; but time and a New York lack of street inspectors have torn up the pavement, which tears up every passer over it.

The coach pays no regard to our feelings, but gallops swiftly over the holes and the rocks, tossing us from side to side, and from bottom to top, as if we were having a young earthquake all to ourselves. This continues for a mile, when the untorn pavement is struck, and we bowl away at a break-neck pace through the slightly startled town, whose one-story plastered huts are prettily washed in light and grateful colors. The rattle and toss of the coach increase at every whirl of the wheels, till we rush fero-

ciously up to a long high wall, pierced with long high windows, well protected with long high bars, a single story, and striped prettily in fancy colors. At the big portal we stop, with a jounce worse than all that preceded, and beggars of every degree welcome us to the Hotel Diligencias of Orizaba. How they whine and grin and show off their horrid rags and sores! What a commentary on Romanism! It breeds these human vermin as naturally as the blankets of its worshipers do the less noisome sort. The more "piety," the more poverty; the more of workless faith, the more of this idle work.

A live mill keeps the town chattering, and gives it an unusual activity. But for that, only earthquakes, of which it has a goodly share, would keep it in motion. This mill is romantically set in a luscious ravine, over a rattling river, where bananas and all tropical fruits and flowers overflow it with their luxuriance.

Orizaba is the favorite resort of the gentry of Mexico. Being on the railroad, it has outstripped its rivals, Jalapa and Cuernavaca, and bids fair to be the winter home of the big city. Some of the finest estates in the world are perched on its hills and hidden in its hollows. They enjoy the perpetual luxury of every tropical product, with the pyramid of ice ever cooling the fancy, if not the air. It will be the favorite resort as well of wanderers from the United States of the North.

The cars begin to climb up the Cumbres;

four thousand feet they accomplish in less than thirty miles. It is holding on by the eyelids.

"The boldest held their breath
For a time."

As they go, step by step, up the sides of these gorges, which "ope their ponderous and marble jaws" to swallow up that smoking, puffing insect which crawls like a beetle, its rings each separate car, along the almost precipitous sides of the huge barrancas, a hand thrust out on one side would touch the mountain, on the other stretch out over thousands of feet of empty space between it and the rocks below. The road is the finest bit of engineering on this, if not on any continent.

At length the Boca del Monte is reached (the mouth of the mount), and smoother ways are before us. The table-land and the temperate zone are ours. The famed valley of Anahuac, the most famed mountain valley in the world, is before us, with its pueblitos, pulque, and historic charms. We will run off a matter of twenty miles before we visit the central city, and get a look at the

most sacred city of the country, Puebla de los Angeles (the city of the angels). The railroad entrance is not attractive; the stage-coach is. You run down a long, wide, broken, dusty thoroughfare, filled with asses and asseeters—for if muleteers are drivers of mules, asseeters should be drivers of asses. These poor beasts, four-legged and two-legged, are heavily loaded with earthenware, charcoal, wood, hay, stone, corn, coffee—all the products of the country. Men carry three hundred pounds laid along their backs from far above the head. Women are not less heavily laden. Children grow up to these carriages. No wonder, seeing such—for such the hills and valleys of Palestine alone possessed in His days—the Master cried out, "Woe unto you, Pharisees, hypocrites, for ye bind heavy burdens and grievous to be borne, and lay them on men's shoulders, but ye yourselves will not move them with one of your fingers." It is so here to-day, bodily and spiritually. The lords of the church and the state move not with one of their dainty fingers the grievous burdens which they lay upon the backs and brains

and hearts of their brethren. They have filled religion with masses and festas and forms, and every thing but Christ and peace. Again we hear Him, turning from the pharisaic masters to the toiling people, cry out, "Come unto me all ye that labor and are heavy laden, and I will give you rest." May they soon respond,

"Yes, gracious Saviour,
we will come,
Obey, and be forever
blessed."

Then will their burdens roll off their shoulders as well as their souls. Christianity puts the load from the head of man and woman to the back of beast, to the cart and the car. Stephenson is simply a fulfiller of the prophecies. These rushing cars are carrying off the burden of superstition as well as more marketable commodities.

The broad way gathers itself up a

RIVER AT ORIZABA.

GREAT BRIDGE OF MATHATA.

little, and passes between the Alameda—a pleasant shady public drive and walk—and the Church of San Francisco, with its paved court along the street side covering an acre or more, its deep arcades, once for priestly refreshment, now soldiers' barracks, and its tall, square, not ungainly towers, that look as if they could stand many an earthquake and bombardment still, as they have already for a hundred years or more.

The clean streets are washed by rivulets from Iztacihuatl, which lies right over our heads, though forty miles away. How superbly sleeps that snow range above this green meadow and gray town! Were it not too sad a reflection, one might fancy it a body shrouded and laid in state on that high catafalque ten thousand feet above our eyes. Its name means the White Woman, and the sleeping form too painfully suggests death.

The city lieth four square. It was constructed under priestly direction, from a stone opposite where the Convent of the Inquisition stands, or stood, for it is mostly in ruins to-day. A street has been cut through it, and the covered way by which the priests and friars traversed its broad acres lies open to the day.

The Methodist Episcopal Church holds a portion of these ruins, and has already established its mission here. In opening these ruins a well in the wall was struck, and a mass of human bones rolled out. They had

been cast in from above, and in the long years had filled the horrid well. Close by a cell was opened large enough to hold three persons in a semi-crouching posture. A little hole let in food and air, if the keepers so pleased; but walled in otherwise, doubtless this hole was also closed, and the victims left to starve here, as they were found in a like Inquisition at Mexico.

The chief attraction of the city is the cathedral. None more magnificent exists in the country. It has a broad paved area between its wall and the street, lifted up some three feet above the sidewalk. On the opposite side of the street is a pretty plaza studded with trees. The towers rise in grand proportions, and the big bells drop down the mellowest fruit of melody. The inside is simple and rich. The grooved pillars, three feet in diameter, rise ninety feet to the groined ceiling, whose springing arches bend like a hand of heaven, each ridge a finger, above the prostrate worshippers. The high altar is a marvel of alabaster, or what shines like unto it, of malachite, or its best imitation, of ruddy marble fluted columns, the edge faced with gold, presenting a bewildering blaze of burnished stone and flashing gold.

The services are as powerless as the temple is powerful. The mass is said, loud rings of bells striking harshly the command to bow and bewail; singers sing their artistic utmost; changing robes and genuflections

and gymnastics, and other paraphernalia of costume and conduct, fill up the weary hour, set off with a brief sermon by a junior preacher. The temple is grand. When will the worshipers be also?

A more sacred city lies a dozen miles away, or did lie, when Cortez conquered the country. Cholula was its name. Here was many a teocalli, and human victims daily wet their hundred altars with their heart's blood. Here, too, was the white-faced god supposed to take up his abode, of whom it was told that he left the land for the East, and would some day return. This prophecy had no little to do with preparing the hearts of the people for accepting the white and bearded strangers as the ancient god of Cholula. Their fearful sacrifice of human life was no unnatural commentary on this expectation, for it filled up in another form the measure of his daily service.

The ride hither on horseback on a charming spring morning, as springs are in Northern latitudes, was itself enchanting. Such

RUINS OF THE COVERED WAY TO THE INQUISITION, PUEBLA.

verve is in the horse and its rider, the horse that only knows a rider, and the rider that

only knows a horse. Our leader was of this last sort, an old cavalier, who was got up in old Mexican fashion, regardless of expense. Like Old Grimes, his coat was "all buttoned down," and pantaloons too, but not before; the side was the favorite place to show off these string-lets of silver knobs. Three hundred dollars his array sometimes costs. The broad felt hat, itself girt with a silver band, and the silver trappings on saddle and bridle, completed the outfit of the gay old man, who trolled love-songs with broken voice as though he were still a beardless bravo of twenty instead of one past his three-

STREET VIEW IN PUEBLA.

CATHEDRAL OF PUEBLA.

score. I have no picture of his face, so weakened, but the Mexican horse and his rider are well set forth in this actual portrait.

The city of the plain is only distinguishable by a single mound, that towers to a respectable hill. Mr. Beecher says somewhere that one can understand the labor involved in making a mountain by shoveling and wheeling and dumping a few barrows of earth in his own lot. The Cholulans shoveled, wheeled, and dumped (if, indeed, they did wheel, and did not carry it on their shoulders and heads, which is the more likely) not less than a score or two of millions of such barrow-loads, to make a temple for their chief god, and on which many of those who built it, or their children, were offered in sacrifice. It is a big as well as a bad faith that would thus make multitudes erect joyfully their own funeral pyre.

This pyre has a base of forty acres, the size of Boston Common. Conceive of those free-religion Puritans leveling off that sacred place, and bringing loads of earth from Brighton, Brookline, Dorchester, and Somerville to erect the whole level square into a pyramid as high as the pine-apple of its State-house! Up, up, up slowly creeps the mighty plateau, growing narrow as it grows taller, like many uplifted men. Yet when above the tallest house of Beacon Street, it is twenty acres across; and when it reaches the dome of the

Capitol, it is ten acres across; and when it stops at the pine-apple knob, it is two or three acres across. And all this for faith, and a faith which involved their own immolation, or that of their nearest friends and kindred! How happens it that Boston goes to Buddha for its god? He lies nearer

A MEXICAN GENERAL.

home on these Aztec plains; he is a native American, the better suiting their national or continental conceit; he shows us a faith that makes Buddha's nirvana tame, for suicide is always baser than submission to another's knife. The pyramid of Cholula is the shrine that should draw these worshippers. Here is the eleventh religion that should swallow up all their ten, for it is more majestic than any, save the one that builds its temple in the skies, and offers up its one victim, the Divine Author thereof, freely and of His own will, for the world's salvation.

The pyramid is mounted by a roadway cut to the top. You see along the cleft edge the strata of thin brick and other substances which went to its composition. Orchards open half-way up, ravines drop down near the summit; all the traits of natural hills appear. A winding row of steps makes the last ascent. The prospect is one of great breadth and beauty and desolation. Scores of empty churches stand in an empty town. The population has dwindled to its shortest span; a few hundreds hug the broad plaza, bigger than any in the country save that of the capital, and as void of life at mid-day as a grave-yard. "Great expectations" is written all over this place. A tiny church, fresh in stucco and colored washes, flush with the street, accommodates all the people of the town. A tinier one going up on this summit, still more richly arrayed in fresco and fiction, is for festal uses, and as a monument of the triumph of the Church over fratricide.

Cortez recognized the value of this spot, both by his leaving here the little image of the Virgin which he carried in all his campaigns, and by his planting so many churches here, and a whole sacred city only ten miles away. The image and the Spanish city remain, but the Indian town vanished with the Indian faith, and no attempts to save it by inoculation of temples of another creed, though they be over forty in number, shall avail to preserve it from becoming a desolation. The hundreds to which it is reduced will become tens, and the tens a ci-

VIEW FROM THE PYRAMID OF CHOLULA.

pher, unless a more stimulant faith seize and is seized by the people.

The superb snow hills of Popocatepetl and Iztaccihuatl look down on the dead city, its lustrous monuments. When will these tombstones see the dead town below them rise again? When?

The plain of Anahuac welcomes us from the junction of the Puebla and Vera Cruz roads. It opens up before that, for Puebla is on the same general plateau, and we ride on a level, without break, except ravines cracked by heat and rain, from its gates to those of the capital. The pulque drink and the maguey plant appear first on these high and dry plains. The latter is the familiar broad, green, long, lance leaf of the *Agave americana*, so well known in our conservatories. The latter is the drink gotten from its bowl just before its bud bursts into flower. The plain is lovely to the eye. Stretching for miles in straight rows some eight feet apart, it gives the bare and blazing land a refreshment of green that is gladdening to the eye.

But when the white sour swill is thrust under your nose by these brown hags, and its nasty smell strikes through the sense into the soul, you see or smell how the gifts of God can be perverted by the depravity of man. The taste is as bad as the smell, as one touch of the tongue to the "white trash" sufficed to prove. Yet at the start it is sweet as new cider, as delectable and as harmless. But, like that, it rapidly breeds sourness and

nastiness, and comes to the front rank with London porter, Bavaria beer, and Albany ale, "stinkingest of the stinking kind" to which the appetite of man uncontrolled drags his body and his soul.

We swing round the lowest eastern spurs of the two snow volcanoes. The lake flashes upon us on which Cortez made his boats, over which Prescott spends a large and needless amount of romance; for the lake is a shallow salt pond, and the boats were mere scows. On the opposite side, sixty miles back, are the silver hills of Pachuca and the sierras of Zumpango. Soon Otumba appears, where Cortez fought his greatest fight, without a gun, or pistol, or horse, reduced with a score of reckless followers

to the level of his foes. As he debouched through yonder western hills on this broad plain, after the Triste Noche, he met here hundreds of thousands of the Aztecs in solid rank. Cutting his way through till his arm and sword failed, seeing the palanquin of the chief, rushing for it, and striking him dead, he sent a panic into the multitude, who let him through to these lower spurs round which we have just run, on whose farther side, looking toward Puebla, or Cholula then, dwelt his faithful allies, the Tlascalans, who received him, and helped him organize a victory that has continued until now.

Not far from Otumba stand forth two pyramids of earth, like those of Cholula, called the Sun and Moon, each several hundred feet square and high, on a geometric line with each other as perfect as a Hoosac Tunnel engineer could have carved them, each now surmounted with a tiny chapel, emblem of their conversion to the Roman faith. They are the only Aztec remains of mark in all the valley; and they are probably Toltec, an ante-Aztec race to which that warlike people were indebted for all their arts and refinements, perhaps also for their horrid barbarities of worship.

Guadalupe soon appears on the right, a sierra not three miles from the city, the most sacred mountain of Mexico or America, and the most profane. A *via sacra* ran from it to the town, on which the penitent myriads walked upon their knees. Now our train rushes over it regardless of shrines and kneelers and other vanities of faith. The worshipers have accepted the situation, and ride to and from the favorite seat of their goddess in the railway car, even as

MAGUEY PLANT.

pilgrimages are now going on over Europe in first and third class trains. The times change, and we change with them.

The city glitters in the light of the setting sun. Its last beams are gathering on the peaks of the silent Alps that stand forth on our eastern sky, as they had stood on the western when at Puebla. We have run clear round them. They change their light to color, grow rosy in that flush sent from between the saws of Ajusco on the west, and then turn to the awful white of death.

Ere that the Hotel Gillow has welcomed us to its comfortable chambers, and we are housed like Cortez in the Aztec capital.

TOO LATE.

With burning brow on fevered hand,
Slow fading with the fading day,
I sit beside the darkling strand
While moaning tide and land-wind say:
"Thy wide world died by land and sea
With that great heart that died for thee."

The sighings of her wasting breast
Were breathed to cold, unanswering night—
Alone, forsaken, and unguessed,
She passed, a blighted flower, from sight;
And now the land-wind bears my cry
To deaf abyss of seaward sky.

A single star's un pitying gleam
Lights up the storm-weed at my feet;
And, shore-cast wreck, I sit and dream
While my lost heart, with waning beat,
Breaks slowly, by the breaking sea,
For that great heart that brake for me.

A NATURALIST IN THE HEART OF AFRICA.

[Second Paper.]

KING MUNZA.

THE country of the Niam-niams, that savage tribe whose very name signifies "great eaters," is situated between the fourth and sixth parallels of north latitude. Dr. Schweinfurth's travels were confined exclusively to the eastern portion, and of the extent of the country toward the west he was unable to gain any definite information. Desirous as he was to follow the Welle River far into the unknown interior, he was obliged to content himself with only partial surveys and explorations, as the great trading caravan to which he had attached himself completed its collection of ivory, and

proceeded no farther southward than the land of King Munza.

Dr. Schweinfurth lived among these Niam-niams long enough to make a very thorough study of their character. He possesses such large insight that even here among cannibals we find him searching out the good and the human in these creatures, who seem but little above the beasts, and declaring them to be men of like passions with ourselves, equally subject to the same sentiments of grief and joy, and even with a keen appreciation of humor. With the exception of their appetite for human flesh, their cus-

toms are substantially the same as those of other wild African tribes. They wear very little clothing, and spend all their energy on their head-dresses. A remarkable but common head-dress among these curious savages is made by a hoop, which is fastened to the lower rim of a straw hat. Single tresses of hair are then taken from all parts of the head and stretched tightly over the hoop, producing an effect like the rays of glory which adorn the pictures of a saint. This elaborate coiffure demands great attention, and much labor must be spent upon it every day.

Whenever a Niam-niam has lost any very near relative, the first token of his bereavement is shown by his shaving his head. His elaborate coiffure—that which had been his pride and his delight, the labor of devoted conjugal hands—is all ruthlessly destroyed, the tufts, the braids, the tresses, being scattered far and wide about the roads in the recesses of the wilderness.

The time of these people, when they are not at war with surrounding tribes, is divided between hunting and tilling the soil. Sweet-potatoes and yams are easily cultivated, and the tobacco crop is large and of excellent quality. All the Niam-niams are great lovers of tobacco. They never chew,

but smoke the fragrant weed from neat little clay pipes. Of all the plants which are cultivated by the natives of Central Africa, none excites a feeling of greater interest than tobacco, suggesting, as it does, a curious conformity of habit among peoples far remote. Although the wanderer in the wilderness may not eat the food of his African entertainer, nor drink his curious decoction of various herbs, he still can sit down and smoke with him, enjoying a feeling of brotherhood in that particular at least. The same two kinds which are cultivated among ourselves have become most generally recognized. These kinds are the Virginian tobacco (*Nicotiana tabacum*) and the common tobacco (*N. rustica*). The Virginia tobacco grows abundantly in this locality, but the leaves never attain a large size, and there is difficulty in obtaining them of sufficient size to be made use of in rolling cigars. Negroes always sow tobacco in a frame before they plant it out; the mid-day sun of Central Africa is too powerful for the seed, which infallibly perishes in a parched soil. It is a sure indication of the foreign origin of this plant that there is not a tribe from the Niger to the Nile which has a native word of its own to denote it. Throughout all the districts over which Schweinfurth traveled

LIFE IN CAMP.

Vol. XLIX.—No. 289.—2

NIAM-NIAM HEAD-DRESS.

the Niam-niams formed the solitary exception to this by naming the Virginian tobacco "gundeh;" but the Monbuttoos, who grow only this one kind, and are as little familiar with *N. rustica* as the Niam-niams, call it "E-taboo." The rest of the people ring every kind of change upon the root word, and call it "tab," "tabba," "tabdeet," or "tom."

The Niam-niams show much skill and artistic taste in moulding clay and in wood-carving. They manufacture all kinds of dishes and bowls, and water flasks of divers

patterns, some being really beautiful in design. They appear to have an instinctive love of art, and music rejoices their very soul. The little mandolin, which they carve from wood, is the most perfect musical instrument found among the wild Africans. It has five or six strings, arranged on strict acoustic principles, with screws for tightening and tuning them. The music of these little instruments is wild, melancholy, and monotonous, but it thrills the inmost nature of the native. There is a singular class of professional musicians among the Niam-niams which seem to be a grotesque echo of the wandering troubadours of olden time. These musicians present a remarkable appearance. They are always decked out in the most fantastic way with feathers, and

covered with a promiscuous array of bits of wood and roots, and all the pretentious emblems of magical art, the feet of earth-pigs, the shells of tortoises, the beaks of eagles, the claws of birds, and teeth in every variety. They wander about from village to village, reciting tales of ancient heroes as well as their own adventures, never forgetting to conclude by an appeal to the liberality of the audience, reminding them that a reward either of copper rings or beads would be thankfully received. These

NIAM-NIAM CLAY PIPES.

wandering minstrels are occasionally met with among other African tribes, but nowhere do they present such an exaggeration of minstrelsy as among the Niam-niams.

The Monbuttoo country, where King Munza lived in barbaric magnificence, lies several degrees to the westward of the Albert Nyanza Lake. Munza was impatiently awaiting the arrival of the Khartoomers. His store-houses were piled to the full with ivory, the hunting booty of an entire year, which he was eager to exchange for the produce of the north, or to see replaced by new supplies of the red ringing metal which should flow into his treasury.

It was in March, 1870, nearly two years after his departure from Europe, that Dr. Schweinfurth arrived at the court of this Central African king. On the morning after the caravan had formed its camp Schweinfurth was informed that all arrangements were complete, and that his African majesty was waiting to receive the stranger. The royal residence was half an hour's march from the camp, and thither Schweinfurth proceeded with all possible solemnity and magnificence. A black body-guard went with him as escort, and the trumpeters had orders to usher him into the royal presence with a flourish of the Turkish reveille. Three black squires bore his rifles and revolvers, followed by a fourth with his cane chair. Next in order, and in awe-struck silence, came several Nubian servants clad in festive garments of unspotted whiteness, and bearing in their hands the offering that had been so long and carefully reserved for the Monbuttoo king.

As the party approached the royal hut the drums and trumpets were sounded to their fullest power, and the natives pushed forward in such crowds that the strangers could scarcely force their way along. When

NIAM-NIAM TROUBADOUR.

at last they entered the hut, an officer, who appeared to be master of ceremonies, took Schweinfurth by his right hand, and conducted him to the interior of the hall. Here, like the audience at a concert, were arranged according to their rank hundreds of nobles and courtiers, each occupying his own ornamental bench, and decked out with all his war equipments. At the other end of the building a space was left for the royal throne, which differed in no respect from the other

benches except that it stood upon an outspread mat. Schweinfurth's own chair was placed near the royal bench, and he sat down, with his people standing and squatting behind him, and the Nubian soldiers forming a guard around.

For a long time he had to sit waiting before the empty throne, as Munza was in his private apartments undergoing a process of anointing, frizzing, and bedizening at the hands of his wives, that he might appear in the imposing splendor of his state attire.

The grand reception hall of the African king was an architectural curiosity. It was at least a hundred feet in length, forty feet high, and fifty broad. It had been quite recently completed, and the fresh bright look of the materials gave it an enlivening aspect, the natural brown polish of the woodwork looking as though it was gleaming with the lustre of new varnish. Considering the part of Africa in which this hall was found, it might be called one of the wonders of the world. The bold arch of the vaulted roof was supported on three long rows of pillars formed from perfectly straight tree stems, the countless spars and rafters, as well as the other parts of the building, being composed entirely of the leaf-stalks of the wine-palm. The floor was covered with a dark red clay plaster as firm and smooth as asphalt. The sides were inclosed by a low breastwork, and the space between this and the arching roof, which at the sides sloped nearly to the ground, allowed light and air to pass into the building.

After waiting an hour, a loud beating of drums and ringing of bells was heard, and the tawny Cæsar came striding in, followed by a number of his favorite wives. The costume of this cannibal king was most extraordinary. His appearance was decidedly marked with his nationality, for every adornment that he had about him belonged exclusively to Central Africa, as none but the fabrications of his native land are deemed worthy of adorning the person of a king of the Monbuttoo.

Agreeably to the national fashion, a plumed hat rested on the top of his chignon, and soared a foot and a half above his head; this hat was a narrow cylinder of closely plaited reeds; it was ornamented with three layers of red parrots' feathers, and crowned with a plume of the same; there was no brim, but the copper crescent projected from the front like the visor of a Norman helmet. The cartilages of Munza's ears were pierced, and copper bars as thick as the finger inserted in the holes. The entire body was smeared with the native unguent of powdered camwood, which converted the original bright brown tint of his skin into the color that is so conspicuous in ancient Pompeian halls. With the exception of being of an unusually fine texture, his single garment differed in

no respect from what was worn throughout the country; it consisted of a large piece of fig bark impregnated with the same dye that served as his cosmetic, and this, falling in graceful folds about his body, formed breeches and waistcoat all in one. Round thongs of buffalo hide, with heavy copper balls attached to the ends, were fastened round the waist in a huge knot, and like a girdle held the coat, which was neatly hemmed. The material of the coat was so carefully manipulated that it had quite the appearance of a rich moiré antique. Around the king's neck hung a copper ornament, made in little points which radiated like beams all over his chest; on his bare arms were strange-looking pendants, which in shape could only be compared to drumsticks with rings at the end. Half-way up the lower part of the arms and just below the knee were three bright horny-looking circlets cut out of hippopotamus hide, likewise tipped with copper. As a symbol of his dignity, Munza wielded in his right hand the sickle-shaped Monbuttoo cimeter—in this case only an ornamental weapon, and made of pure copper.

Munza seated himself carelessly on his throne, and continued for some time to preserve a dignified silence. At length he unbent a little, and by means of an interpreter asked a few commonplace questions of his visitor. The presents, consisting of mirrors, beads, porcelain, and various specimens of carved ivory, were now brought forward and spread at the king's feet. Munza regarded all these offerings with great attention, but without committing himself to any audible expression of approval. His fifty wives, however, were loud in their expressions of delight, and, woman-like, chose the looking-glass as the object of their special admiration.

And now commenced a wonderful performance, which had been arranged out of compliment to the guests. All manner of horrible musicians sang and played and danced; jesters and court fools played all sorts of pranks, venturing even to indulge in familiarities with the person of the great king himself; and, last of all, Munza rose solemnly from his bench, and proceeded to make a speech, welcoming his visitors and thanking them for their presents.

The Monbuttoo land, apart from its inhabitants, appears like an Eden upon earth. Unnumbered groves of plantains bedeck the gently heaving soil; oil-palms incomparable in beauty, and other monarchs of the stately woods, rise up and spread their glory over the favored scene; along the streams there is a bright expanse of charming verdure, while a grateful shadow ever overhangs the domes of the idyllic huts. The general altitude of the soil ranges from 2500 to 2800 feet above the level of the sea; it consists of alternate depressions, along which the

rivulets make their way, and gentle elevations, which gradually rise till they are some hundred feet above the beds of the streams below. Belonging to one of the most recent formations, and still in process of construction, the ferruginous swamp-ore is found very widely diffused over the Monbuttoo country, and, indeed, extends considerably farther to the south, so that the red earth appears to be nearly universal over the greater part of the highlands of Central Africa. But all this tropical beauty is marred by the dreadful character of the natives. The Monbuttoos are the most pronounced cannibals of all known African tribes, and devour every luckless prisoner who falls into their hands. On several occasions Dr. Schweinfurth came suddenly upon groups of women who were preparing the body of some poor victim for consumption, and in nearly every hut were human arms and legs hanging over the fire, obviously with the design of being at once dried and smoked.

All the way southward Dr. Schweinfurth had listened with eager ears to the talk of the natives of a race of little people dwelling far south of the great Niam-niam land, who seldom grew to more than three feet in height. It was affirmed of them that, armed with strong lances, they would creep underneath the belly of an elephant, and dextrously kill the beast, managing their own movements so adroitly that they could not be reached by the creature's trunk. Their services in this way were asserted to contribute very largely to the resources of the ivory traders. Legends of Pygmies had mingled themselves already with the earliest surviving literature of the Greeks, and the poet of the *Iliad* mentions them as a race that had long been known. Not only the classic poets mention these little human curiosities, but sober historians and geographers speak of their existence as an undisputed fact. Nothing, for instance, could be more definite than the statement of Herodotus about the Nasamonians after they had crossed the Libyan deserts: "They at length saw some trees growing on a plain, and having approached, they began to gather the fruit that grew on the trees; and while they were gathering it some diminutive men, less than men of middle stature, came up and seized them and carried them away." The testimony of Aristotle is yet more precise when he says, plainly: "The cranes fly to the lakes above Egypt, from which flows the Nile; there dwell the Pygmies, and this is no fable, but the pure truth." It is cer-

MONBUTTOO WATER JARS.

tain that three or four centuries before the Christian era the Greeks were aware of the existence of a people inhabiting the districts about the sources of the Nile who were remarkable for their stunted growth, and therefore one is not surprised at the excitement of Dr. Schweinfurth on learning that a small colony of these dwarfs were held in bondage near to the royal residence of King Munza. For several days he was unsuccessful in his attempts to see these men in miniature; the Pygmies, having an idea that the strangers would certainly eat them if they could catch them, kept out of sight. But one morning there was a great shouting in the camp, and Schweinfurth learned that Mohammed, the chief of the trading caravan, had surprised one of the Pygmies in attendance upon the king, and was conveying him, in spite of a strenuous resistance on the part of the little man, straight to the camp. Schweinfurth hurried forward to meet the strange visitor, and there was the little creature, perched upon Mohammed's right shoulder, nervously hugging his head, and casting glances of alarm in every direction. He was seated in a chair, and his fears pacified by means of various presents and some good things to eat. Dr. Schweinfurth drew his portrait, and by means of an interpreter succeeded in gaining much valuable information respecting his tribe and their country.

The name of his nation was Akka, and he asserted that they inhabit large districts lying southeast of the Monbuttoo country. A portion of them are subject to the Monbuttoo king, who, desirous of enhancing the splendor of his court by the addition of any available natural curiosities, had compelled several families of the Pygmies to settle in the vicinity.

The first of the Akka villages, he said, was four days' journey from the residence of Munza, on the farther side of the river Nalobe, one of the great tributaries of the

Welle; that the nation was divided into nine separate kingdoms, and the inhabitants very brave and warlike. The Pygmy grew less timid when he found that the white strangers fed him instead of devouring him, and was finally prevailed upon to perform an Akka war-dance, in which he showed marvelous agility, his leaps and attitudes being accompanied by such grotesque varieties of expression that the spectators held their sides for laughing.

When the little man was at last allowed to go home, he was loaded with presents, and made to understand that all his people would be welcome at the camp, and should lose nothing by coming. In consequence many of this singular tribe came at various times to visit the strangers. They were very nimble little fellows, jumping about in the grass like so many grasshoppers, and so sure in eye and hand, that they could drive a lance or shoot an arrow with never-failing accuracy. The average height of the Akka is about four feet six inches. The head is large, and out of proportion to the weak, thin neck on which it is balanced. The shape of the shoulders is peculiar, differing entirely from that of other negroes in a way

that may probably be accounted for by the unusual scope required for the action of the shoulder-blades; the arms are lanky; and altogether the upper portion of the body has a measurement disproportionately long.

Dr. Schweinfurth asked and obtained a present of a little Pygmy, whom he carried away with him, and kept as his constant companion for more than a year. He was a horrid-looking creature, and although he came in time to manifest some affection toward his protector, he was the most malicious and mischievous of all monkeys. In acuteness, dexterity, and cunning he was unequalled. He was always fond of torturing animals, and took a special pleasure in throwing arrows at the dogs by night. During the period in which the caravan was involved in war with hostile tribes, and while the servants were almost beside themselves with anxiety, nothing afforded him greater amusement than to play with the heads that had been severed from the slain A-Banga, and when Schweinfurth boiled some of the skulls his delight knew no bounds. He rushed about the camp shouting, "Bakinda" (a derisive nickname) "nova? Bakinda he he koto!" (Where is Bakinda? Bakinda is in the pot!)

Dr. Schweinfurth was so devoted to science that he actually allowed this creature to be his companion at meals, and kept him with him constantly, that he might watch the natural development of this freak of nature. He desired to carry the boy with him to Europe; but all his assiduity and attention was in vain. The poor creature died in Berber from a prolonged attack of dysentery, originating not so much in any change of climate or any alteration in his mode of living as in his immoderate excess in eating, a propensity which no influence was sufficient to control.

During the last ten months of his life he did not grow at all. It is probable, therefore, that his height would never have exceeded four feet seven inches, which was his measurement at the time of his death.

It was with a sad and heavy heart that Dr. Schweinfurth began retracing his steps toward the north. It was impossible for him to proceed southward alone with his small number of Nubian followers, and he was obliged to follow the plans of the trading caravan, contenting himself with the fact that the journey northward would pursue a different route through new kingdoms and new countries.

The journey proved to be surrounded with dangers. Hostile natives were swarming on all sides, and more than once the caravan received an official declaration of war, consisting of maize, a feather, and an arrow hung across the path as emblems of defiance. An encounter generally followed these declarations, in which many natives were killed, and

AKKA PYGMY.

often the caravan suffered the loss of numbers of bearers and slaves.

Quite worn out with constant battling with these savages, the caravan at length came to a halt, and went into camp to recruit after the fatigue and excitement. Spacious grass huts were erected, and a palisade was built of trunks of trees as a protection against attack. During the twenty days that the caravan was stationary Dr. Schweinfurth made use of his time to visit a picturesque group of mountains lying to the eastward. They were mostly formed of rough crags of gneiss. The first one reached was Mount Damoo. It was a pointed gneiss mound, rising about two hundred feet above the level of the plain. The rugged rocks were covered with gay blossoming vines and shrubs, and from the summit the view was magnificent. All around were elevations more or less conspicuous, rising like bastions isolated on the plain, while high over all reared the lofty crest of Mount Baginze, four miles away. This short distance had to be accomplished by a circuitous and troublesome route, leading across deep fissures and masses of loose rock, and often through grass of enormous height. Before actually setting foot upon Baginze, there was an ascent to be made through a thick forest, but in due time the mountain was reached, and an encampment made close beneath the perpendicular wall of the western flank. The halting-place was upon the edge of a deep ravine, where a bright thread of water rippled merrily along over rocks covered with moss and graceful ferns. It was too late in the day to attempt to ascend further than to the summit of a sloping spur projecting toward the northwest from the southern side of the mountain, and which was about half the height of the mountain itself.

The flora which covered the rocks was of a gorgeous and tropical character. Masses of brilliant aloes, with their scarlet and yellow blossoms, grew luxuriantly upon the slopes of gneiss; rich green mosses grew as a border to the clear streams, which were bubbling down over the rocks on all sides, while clusters of blue lobelia reared themselves like violets, only of a brighter hue, from the surface of the soil.

The ascent of Mount Baginze was a very difficult task, but after several hours' hard climbing the summit was reached, and the magnificent view amply repaid all the labor to attain it. The prospect extended over fifty miles of territory, and not less than a hundred different mountain peaks were visible. Mount Baginze is estimated to be about 3900 feet above the level of the sea. The bulk of the rock of which the mountain is composed consists of a gneiss so abundant in mica that in many places it has the appearance of being actual mica schist, a specialty in its formation being the immense

number of cyanite crystals that pervade it in all directions: a similar conglomeration of "cyanite gneiss" is very rare, but among other places it may be observed on Mount St. Gotthard in Switzerland. Wherever the springs issue at the foot of the mountain there are wide boulder flats of broken stones, and here the sheets of mica and the prisms of cyanite, an inch or two in length, lay cleanly washed and strewn one upon another in thick confusion.

Massive in its grandeur, isolated, and worn by time, Mount Baginze stands as a witness of a former era in the world's history, and as a remnant of the lofty mountain chain which must have once formed the southern boundary of the Nile district.

One of the greatest difficulties encountered by the caravan was the crossing of streams and rivers. It was not always so fortunate as at the Keebaly, where King Munza placed a large number of canoes at its disposal, but the passage across the rapidly flowing stream was often made at the risk of much loss of merchandise, and with great personal danger. Often there would be a delay of many hours, in order to construct a rude bridge by felling trees across the stream, over which, with much caution, the ivory and bales of various barks and skins would be carried by the bearers. At times when the road lay through the territory of a friendly king, messengers were sent on ahead to warn him of the approach of the caravan, and to beg him to prepare a bridge over some deep and rapid river. This was done as the caravan was drawing near to the river Tondy, and on arriving at the bank of the river a suspension-bridge of a very curious and original construction was found to be already thrown across the rushing water. This aerial pathway, as might be expected, oscillated like a swing, and to convey the baggage across this tottering erection was the work of nearly an entire day. The place of the present transit was four miles to the east of the spot at which the caravan had crossed on its outward journey; it had been chosen higher up the river for several reasons—not only because the stream was narrower and the banks were higher, but principally because the trees were of a larger, more substantial growth, better adapted for the purpose of being converted into piers for the suspended ropes which formed the bridge. The river was here sixty feet wide, but near the banks it was so full of fallen trees and bushes, of which the boughs projected as though growing in the water, that the width of the stream was practically diminished one-half. The velocity of the current was about one hundred and fifteen feet a minute, the depth nowhere being less than ten feet.

The materials of the suspension-bridge consisted exclusively of branches of the wild vine intertwined with thick elastic ropes of

CROSSING THE RIVER TONDY.

unusual strength. In order to get the ropes raised to a sufficient height, a regular scaffolding of fallen stems had to be erected on either side of the river, by means of which the festoons of cords were raised to a proper altitude. The clambering from cross-piece to cross-piece upon this unstable structure, poised in mid-air, seemed to require little less than the agility of an orang-outang; while the very consciousness of the insecurity

of the support was enough to make the passenger lose his composure, even though he were free from giddiness, and already an adept in the gymnastic art.

During the long journey northward, Dr. Schweinfurth found it at times interesting to fall in with some of the natives who had been his friends the year before, but nowhere did he come upon such a tragic history as when he reached the home of Old

Shol, the cattle-princess of Lao village. On approaching the spot, tall columns of smoke were seen rising from the murab of Kurdyook, the husband of Shol. Kurdyook himself soon appeared, and expatiated in very bitter terms upon the lamentable fate of his wife. The natives, it seems, had accused the wealthy Dinka princess of inviting the "Turks" into the country; and as many of the tribes in the neighborhood had been exposed to attacks from the soldiers attached to the trading caravans, they determined to avenge themselves on Shol as being an ally and friend of the Khartoomers. Knowing that she slept alone in her hut, a troop of men belonging to a neighboring tribe set out by night, and under pretext of having business with Kurdyook, her husband, knocked at her door. She had no sooner appeared in answer to their summons than they attacked her with deadly blows; and setting fire to all the huts, drove off nearly all the cattle that were to be found in the place. Dr. Schweinfurth passed close to the spot where her huts had stood, and where the caravan had been so hospitably entertained on taking leave of her. The great kigelia alone remained undisturbed in its glory; the residence was a heap of ashes, and there was nothing else to tell of poor old Shol's former splendor than the strips and shreds of a few charred rafters.

Nowhere in the world has slavery been so thoroughly ingrafted and so widely disseminated as in Africa; the earliest mariners who circumnavigated its coasts found a system of kidnaping every where established on a firm basis, and extending in its business relations far into the interior of the continent; the idea arose how advantageously the owners of land in the distant East might cull the costly products of their soil by the hands of slaves, and the kernel of a single plant, the coffee berry, became the means of uniting the remotest lands, and had the effect of throwing a large portion of the human race into subjection to their fellows, while Christian nations became the patrons and the propagators of the disgraceful traffic. It has therefore happened in the natural course of things that philanthropists have first applied their energies to the slave-trade in the West; the East has still to tarry for an enlightenment which is destined in the fullness of time to gladden a future chapter of history.

The overland slave-trade in the eastern portion of Africa was never so flourishing as in the winter of 1870-71, when Dr. Schweinfurth was at its very fountain-head. The scenes of cruelty he witnessed are almost incredible. Along the Nile, it is true, where the route was open and every thing obliged to be above-board, the Governor-General had commenced proceedings for the suppression of the slave-trade by a series of bombastic

and pompous proclamations; but here, in the deep interior, there was every facility for the carrying on of the avowedly prohibited traffic.

There are no slave-dealers more cruel than the commanders of the small detachments of Egyptian troops; as they move about from seriba to seriba, they may be seen followed by a train of their swarthy property, which grows longer and longer after every halt.

But quite apart from these pettifogging traders, there are numbers of more important investors, who, protected by a large retinue of armed slaves, and accompanied by long trains of loaded oxen and asses, carry on a business which brings many hundreds of their fellow-creatures into the market. Their store of slaves appears absolutely inexhaustible; year after year the territories which they hold under control go on yielding thousands upon thousands of these poor savages, who are sold at the seribas sometimes for copper, but more often given in exchange for calico and cotton goods.

The slaves brought from the Bahr-el-Ghazal districts vary in value according to their nationality. The Bongos are the most prized, as they are easily taught, and are docile and faithful, and are, besides, good-looking and industrious. True Niam-niams, especially young girls, are, however, much dearer than the best Bongo slaves, but they are so extremely rare as hardly to admit of having a price quoted. The Mittoos are of little value, being ugly, lean, and incapable of enduring fatigue, or even of undertaking any regular work. No amount of good living or kind treatment can overcome the love of freedom of the Babuckurs; they take every opportunity of effecting an escape, and can only be secured by fetters and by the yoke; and it is very common in Central Africa to see bands of these poor creatures following the caravans, tethered together by heavy thongs around the neck. The hunting down of these slaves, if by any chance they escape, is pursued without mercy, and woe to the poor runaway who is recaptured by his cruel keepers! It were better for him to die of hunger in the swamps than to fall into the hands of his merciless captor.

Even boys of seven and eight years of age are kept in slavery to the soldiers, who employ them to carry guns and ammunition. Every Nubian soldier possesses at least one of these juvenile armor-bearers, who, as they grow large and strong, are put to the hardest work in the seribas.

But the most hapless creature of all is the single female slave of the poorer soldier. She is a regular drudge: she has to bring water from the well in great pitchers, which she carries on her head; she does all the washing, if there is any thing to wash; she grinds the corn upon the murhaga, makes the dough, roasts the kissere on the doka,

SLAVE WOMAN AND BOY.

and finally prepares the melah—a horrible greasy concoction of water, sesame-oil, or pounded sesame, bamia pods, and corchorus leaves, beautifully seasoned with cayenne pepper and alkali. Not only has she to do the sweeping of the whole house, but she has to get wood from the wilderness, and, when on a journey, to carry all the lumber of her lord and master. The very laborious process of grinding the corn is performed by pounding the grain on a large stone, called murhaga, by means of a smaller stone held in the hand; it is the only meth-

od known to the majority of African nations, and is so slow that by the hardest day's work a woman is able to prepare only a sufficient quantity of meal for five or six men. A newly captured slave woman may often be seen working at the murhaga, with a heavy yoke fastened to the neck to prevent any chance of escape. A boy is generally placed as a spy upon her conduct, whose duty it is to support one end of the yoke, that its weight may not prevent her from doing a full day's work.

The worst feature of the slave-trade is the depopulation of Africa. Whole tracts

of country are turned into barren, uninhabited wildernesses, because all the young girls have been carried out of the country. Turks and Arabs urge that they are only drawing off useless blood, that if these people are allowed to increase and multiply, they will only turn round and kill one another. But the truth is far otherwise. The time has come when the vast continent of Africa can no longer be dispensed with; it must take its share in the commerce of the world, and this can not be effected until slavery is abolished.

THE PRISONER.

For years upon his dungeon floor
He sat and counted o'er and o'er
The hopeless links that, grim and fast,
Chained out the Future and the Past;
Trailing in rugged ruthless twist
Down to the ankle from the wrist,
Thence gliding, like a living thing,
To grapple with an iron ring.
He sat and counted, vaguely smiling,
Himself with gibberish beguiling.
For years like this; and then one night,
Awaked as by a piercing call,
Aroused as by a blinding light,
With groping hands upon the wall,
He caught his breath, remembering all!

Save the hoarse rattle of his breath,
There fell long stillness, mute as death.
Upward and fixed his blood-shot eyes;
His bosom strives with death-like sighs;
He feels no hope; but one desire
Now burns him with a growing fire—
To climb and reach yon window bar,
And, hanging thence, behold afar
The soft pale glimmer of a star,
Or stray white cloud afloat and free
Upon the morning's golden sea,
Or curling smoke of village fires,
Or glittering tips of distant spires,

And feel—oh, nameless ecstasy!—
Descending from the radiant skies,
To breathe upon his weary eyes,
The ministering Angel of the Air;
To feel her light and close embrace,
Her silent kisses on his face,
Her viewless fingers lift his hair,
As through his trance of helpless woe
Her sweet mysterious whispers flow.

To hear, far down, the hollow boom
Of waves that beat his living tomb,
The free wild waste that ever glides,
Its restless surge and sounding dash
Changed only for the softer plash
And murmur of receding tides.

He gazes, gropes, and crouching, springs;
His chain clanks harshly on the walls;
He clutches wildly, clasps and clings
To empty air, and moans and falls;
There pants a little while, and then
Attempts the hopeless toil again;
And many times, for many days,
The ever-baffled task essays.

Against the wall, his vigor spent,
He leans, an old man, gray and bent,

BEFORE HIS SOUL, AS IN A GLASS, A TRAIN OF GENTLE PHANTOMS PASS.

With hands that, locked in gusts of pain,
Shake sullen murmurs from his chain.
He sits and broods with bended head—
Despair has gnawed him to the core:
"There is no God! or God is dead!"
He mutters, and looks up no more.

But suddenly the silence heard
The carol of a little bird.
Far up, alighting on the sill
With faintest whirr of folding wing,
Between the bars its little bill
Of clearest chirp and tuneful trill
Poured forth its pearly twittering.

Its song was like a happy heart
That could not bear its joy alone,
But gushed and bubbled—never art
Attained such miracle of tone.

Like trembling crystal bells, each note,
Responsive to a silvern tongue
Suspended in its swelling throat,
In breath-vibrations softly swung.

It sang and sang, until the lay
Its bounding heart could not repress
By faint gradations sank away,
Hushed sweetly in its own excess.

He looks not up, but through his tears,
In speechless tension listening, hears,
A moment plumed with gentle care,
The rustling flutter of the wing
By which the free and heavenly thing
Sails o'er the silver seas of air.

So deeply sank the artless strain
His soul forgot the clanking chain;
Only a shudder told he knew
The moment when the minstrel flew.

He cast himself upon the floor,
His cold cheek to the colder stone;
His heart, though desolate and sore,
Cries inly, with a patient moan,
"God is, and God is love alone!
I will have faith for evermore!"

Hour after hour the sad one lay,
In silence rapt, as in a swoon.
From languid arms of sleeping Noon
To evening slipped the waning day,
And blushed along the prison bars;
Above, the glimmering Milky Way
Unrolled its wide white belt of stars.

He tries to rise, but only kneels;
For with new solemn joy he feels
In laboring chest and failing breath
The promise of the angel Death.
Cold dews upon his forehead start;
His lips in trembling whispers part:

"Ah me! who knows? perhaps that little bird
Has sung in distant bow'rs where *she* has heard—
Has heard, alas! and never dreamed that strain
Was the one break in my long night of pain.

"Sometimes I fancy that sweet breast of thine
Gives nightly rest to other head than mine;
Sweet wife! lost wife! so sweet! so lost to me!
If this be true, I would not I were free.
So dear I loved thee, darling, ah! so well,
That here, forsaken, in this dreadful cell,
I could wish only good, yea, *any* good, to thee!
I would not have thee live alone, as I,
Nor in such solitude as mine to die.
Thou wouldst not know me if to-day I stood
Freed from my shackles and my solitude.
I can, in fancy, see the tender grace
With which thou wouldst avert thy pitying face,
Nor think one moment of the mournful truth,
Nor deem such wreck the lover of thy youth!

"This bent and shaking form, this whitened hair,
This brow o'erwritten by the hand of care,
And pale with such unspeakable despair
As leaves death's livid impress there;
These cheeks with hollows scooped by scalding
tears
And the slow famine of the heart for years,
In which no human voice, no light of day,
Pierced the dim dungeon in whose depths I lay—
This is the story nothing else can tell
Like the stern rigors of the prison cell.

"There was a time, long since, I raved,
And night and day unceasing craved
For death to reach me in this tomb
Of loneliest silence, rayless gloom.

"But human love, nor tears, nor prayers,
Can enter here, or hence depart;
There is but One who knows or cares
For this forgotten breaking heart.

"But now the dreadful strain is past;
O dungeon, thou must yield at last!
Would, dearest, thou wert gone before,
To meet me on life's further shore;
But yet, whatever change betide,
True hearts forever true abide,
And somewhere in that blessed life
We shall be sure to meet, sweet wife!"

His half-freed spirit, deeply wrought,
Sublimely poised in quickened thought,
Lifts suddenly the partial mist
Where memory keeps eternal tryst.

Before his soul, as in a glass,
A train of gentle phantoms pass.
O holy vision! In the dim
Far dawn his mother smiles on him;
He feels her bosom softly rise,
Her kisses on his lips and eyes;
In her bright hair his dimpling hands,
Unchided, twist the silken strands,
While he, in rosy infant charms,
Once more lies nestling in her arms.

The greensward in the setting sun;
The eager play when school was done;
The little girl who pulled his hair,
And, when he kissed her, cried, "No fair!"
Swift set her little buskin down,
And pushed him from her with a frown,
Yet smiled and blushed a moment after,
O'erripping in coquettish laughter;

To whom he used to shyly bring
The earliest blossoms of the spring,
The nuts he gathered when the year
Put on her gold and purple gear—
Ah, how she took, with simple grace,
His humble gifts as homage due,
And flashed across his dazzled face
Her thankless eyes of sparkling blue!

At length, most near, most like to life,
The image of his girlish wife—
The graceful shape, the beaming eye,
The warm lips parted musingly,
The white young arms upon her breast,
Crossed in the guise of guileless rest—
They weave a dream of other days:
He could believe his loss a lie,
So clear her fixed and loving gaze.

Though something in the soft still beam
Transcends the purport of a dream,
And while he feels that death is kind
To yield such visions to his mind,
His eyes with swift sweet wonder shine—
Their lifted gaze no prison walls confine!

The night passed on, and at break of day
They pushed from his cell the bolts away.
"He sleeps," they said; but he lay so still
Their hearts were stirred with a prescient thrill.
"Awake! arise! *thou art free!*" they cried.
The dungeon echoes alone replied.

COLLECTING SALMON SPAWN IN MAINE.

FISH-WEIR AT BUCKSPORT NARROWS.

NOT far beyond the memory of men now living salmon abounded in nearly every New England river north of the Connecticut, which appears to have been their southern limit, and in all the tributaries of the St. Lawrence below Niagara, with rare exceptions. Under provident management the salmon fishery of these rivers might have continued for an indefinite number of years to yield a large supply of nutritious food for the sustenance of our teeming population; but the greed of the few and the indifference of the many have resulted in the extermination of this noble fish in nearly all those waters. Of the tributaries of the St. Lawrence within the limits of the United States, Salmon River, in New York, is the only one now annually frequented by salmon, and on the Atlantic coast they are constant visitors only in the Kennebec, Penobscot, Muscongus, East Machias, Dennys, and St. Croix. Of these, the Penobscot furnishes more than all the others, and its ordinary annual yield may be put at from five to ten thousand salmon. This does not exceed the twentieth part of its capacity, if the latter may be measured by the product of some Irish salmon rivers, and certainly bears a small proportion to the former actual yield of the Penobscot itself.

When the work of restoring the migratory fishes to their barren rivers was first under-

taken by the New England States, the salmon naturally received a large share of attention, and from that time till the present persistent efforts have been made to re-establish him in his old haunts. It is a well-known habit of migratory fishes, such as the shad and salmon, to return, when full-grown, from the sea to the rivers where they were reared, and there deposit their spawn. In order, therefore, to restock an exhausted salmon river, it is only necessary to place in its upper waters very young salmon, in sufficient numbers to insure the growth of a considerable number to full size, after allowing for all losses by the ordinary perils incident to fish life. The only practicable way of securing an ample supply of the young fish is to obtain the eggs and hatch them.

The importance of restoring salmon rivers to the fullest possible yield will be better understood by our citizens when they learn the almost incredible growth of the fish. This is asserted by some close observers to be nearly a pound a month. The experiments thus far made in this country are not sufficiently complete to give perfect information on this point, but they do not vary greatly from facts which have been gathered by persons in Scotland and elsewhere, who seem to agree that spawn deposited in November is hatched in the following March; in May the "smolts" have attained two or

three inches in length, and take their course toward salt-water, from which they return in the fall greatly increased in size. Shaw, in his *Zoology*, mentions that a salmon of seven and three-quarter pounds was marked with scissors on the back fin and tail, and turned out on the 7th of February, and being retaken in March of the following year, was found to have increased to a weight of seventeen and a half pounds. Mr. Michael Carroll, of Newfoundland, gives instances nearly as remarkable.

The first attempts at collecting the spawn were made in New Brunswick, whose rivers still abound with salmon. New Hampshire had the honor of sending out the pioneer expedition, under charge of Dr. W. W. Fletcher, who succeeded in bringing back a lot of healthy eggs. The same gentleman made a second expedition, and subsequently Mr. Livingston Stone, under the patronage of several States, erected a large hatching house on the Miramichi River, and prepared to collect eggs on a large scale. But, for reasons that it is unnecessary to discuss here, it was found impracticable to carry on these operations, and they had to be abandoned. The only remaining way of obtaining salmon eggs was to buy them at the Canadian governmental establishment in Ontario, where they were sold at forty dollars in gold per thousand, a price which would have placed the purchase of an adequate supply entirely beyond the means at the command of the State Commissioners, even had the establishment been on a sufficiently large scale to furnish them, which was not the case. Thus, before any thing adequate to the situation had been done, the cultivation of salmon was brought to a stand-still. At this juncture an enterprise was inaugurated on the Penobscot River, the success of which has put a new aspect on the matter.

The Penobscot, being the most productive salmon river at the present day on the Atlantic coast of the United States, offered better facilities than any other for the collection of spawn. It was proposed to buy a number of living salmon in the month of June, when they are ascending the river and are caught in weirs near Bucksport, and confine them in a small pond or inclosure, in fresh-water, until the maturity of their eggs, which occurs about the 1st of November. This scheme appeared to possess important advantages over the plan of capturing the fish on the upper waters of the river, at or near the spawning season, as had been commonly done in previous operations, and the Commissioners of Maine, Massachusetts, and Connecticut united in its execution. The first experiment was tried in Orland; and though the conditions under which the salmon were confined were so singularly unfortunate as to cause the loss of more than eighty per cent. of the salmon bought, yet

seventy thousand eggs were obtained at a cost less than half the price asked in Canada. The result was so encouraging that in the following year the same parties, joined by the United States Commissioner of Fish and Fisheries and the Commissioners of Rhode Island, founded the establishment at Bucksport which is the subject of the present sketch.

The majority of travelers obtain their first view of Bucksport from the deck of one of the Portland or Boston steamers, and there is not another village of its size on the Penobscot River that makes a show so imposing. Four or five miles below the town the voyager leaves the broad Penobscot Bay, on which he has been sailing for five or six hours, and enters the river. If of an observant turn, particularly if it be near low water, he discerns along the shore numerous fish weirs, built of stakes, brush, and netting, running from high-water mark straight out into deep water. The part near shore always consists of a straight hedge, called the "leader," which, as its name indicates, serves to lead the fish into a large inclosure or "pound" at its outer end. This inclosure opens into a smaller one, and this into a third, all these being so ingeniously constructed that the fish readily pass forward into the last pound, but rarely find their way out into freedom. In the third pound the captured fish are left by the retreating tide on a floor, from which they are gathered by the fisherman at low water. Salmon are the principal fish caught in the weirs on the Penobscot; but many other kinds, such as shad, alewives, herring, menhaden, etc., are caught with them.

The average yield of the fifty-pound nets in the immediate vicinity of Bucksport is not less than four thousand salmon per annum. Quite two-thirds of this number could be secured by purchase for the hatching works, if such a vast number could be handled. At present the catch of salmon from a few nets is quite sufficient to furnish all the eggs which can be conveniently handled. Fortunately, too, the salmon delivered at the hatching house, and the average catch of the nets, will not vary much from three females to the single male, and with this run the eggs may be perfectly impregnated.

Almost any day during the latter part of June there may be seen a number of novel-shaped boats, covered with old duck or some coarse cloth, sunk deep in the water, and in tow of other boats propelled by oars, or by the wind if it be fair, gliding on the flood-tide through the narrows toward Bucksport. The covered boats in tow contain living salmon, which were carefully dipped out of the weirs just before the last ebb-tide left them high and dry. There are large holes opened in each side, near the bow and stern, below the water-line when

the boat is loaded, so that when in motion the water passes freely in at one end and out at the other; iron gratings prevent the escape of the fish. The boat is of the size of a common fisherman's dory, and carries from a dozen to twenty, and sometimes as many as thirty, salmon at a single load. At a landing between two of the wharves stands a dray, backed down into the edge of the water, and on it is a large wooden box partly filled with water. As soon as a salmon boat arrives it is drawn up to the dray, and its living freight is transferred by heavy duck bags to the box. From five to seven only are put into one box, and three or four drays are hardly enough to haul away the salmon as fast as they can be dipped out. On a good fish day several hours are occupied in unloading the boats. As soon as the proper number of salmon are in a box it is filled with water, its cover is shut, and away it goes through the village streets to a freshwater pond that lies about a mile distant over the hills.

This pond has an area of sixty acres, is fifteen feet deep in the spring, and ten feet in midsummer. It receives the drainage of an extensive tract of marsh and bog land, which has colored its water dark brown, and has covered its bottom with a deep deposit of soft mud, in which the roots of water-lilies and various other aquatic plants find generous nourishment, but which is not the kind of bottom most persons would select for a salmon pond. But since this en-

terprise was started salmon have been confined experimentally in several places under varying conditions of water and bottom, but nowhere have they survived the season's confinement in any better condition than here.

The muddy bottom is found in the fall to be of positive advantage. Salmon will not lay their eggs on it, and in seeking for gravel and for running water, which they much prefer, they come in large numbers into the brook by which the pond discharges its water into the Penobscot, and here they can be easily caught and deprived of their spawn.

During June and July the salmon in the pond are constantly jumping, and their agility is remarkable. On two occasions they have been seen to jump clear over a hedge five and a half feet high above the water. It is not supposed they did this with the design of passing the hedge, but accidentally, it being quite common to see them jump to an equal height in the middle of their inclosure, as though the leap were entirely aimless. During the early days of their confinement they are frequently seen swimming in great schools about the shores of the pond. As the summer advances they become more quiet, retreating to the deep water—not very deep, however, for in the drought of August and September the greatest depth in the pond is twelve feet, and in the inclosure where the salmon were kept the past season only nine feet. In such a shallow pond, with such dark water and bottom, the sun's

UNLOADING THE SALMON BOAT.

TURNING SALMON INTO THE POND.

rays exert a powerful influence in midsummer. At one time the temperature of the water at the bottom reached 72° F. Yet this excessive heat has no perceptible effect on the health of the salmon.

During all this time the salmon eat nothing. In fact, there is little room for doubt that their stay in the rivers is one long fast, lasting from six to twelve months. They do seize the sportsman's fly, but it is probably not for the purpose of food, but rather akin to the action of a turkey or a bull rushing after a red rag. It is a common opinion among sportsmen that salmon will not rise to a fly in still water, but this has been plainly disproved at Bucksport. On several occasions in May, September, and October the trial was made for the purpose of testing the matter, and the salmon in the pond were found to take the fly with as much eagerness as in the favorite pools of the Canadian salmon rivers. These were, so far as known, the first instances of salmon being caught with the fly in the Penobscot River, not because their habits are unlike those of their brethren in other rivers, but probably because they have not been fished for enough in the right places.

The salmon are not allowed to range over the whole pond, which has an area of sixty acres, but are confined in a cove containing about ten acres by a strong net, whose top is attached to stakes and whose bottom is held down by a heavy chain. Out of this cove runs the brook where the hatching

house and spawning shed and other fixtures are situated. When October comes, and the salmon exhibit the uneasy, roving disposition that presages the spawning season, a new and smaller inclosure is made near the outlet, with a passage into it from the large inclosure, so contrived that the salmon readily pass through from the larger into the smaller, but can not find their way back. Thus, by the last week in October, a considerable part of the salmon are already collected within a space of about an acre, in close proximity to the brook. A dam and gate regulate the flow of water, and the fall rains have now raised the pond to such a level that when the gate is open a plentiful supply of water rushes out. Until this time a grating has been kept in front of the gate to prevent the salmon from entering the brook prematurely, but this is now removed, and the fish allowed to pass through the gate at their pleasure.

Having once passed the gate, the salmon fall over a drop which effectually prevents their returning to the pond, and are then in a long narrow sluice, which leads them some two hundred feet down the stream into a small pen, from which they are dipped when wanted. Here the whole breadth of the stream is occupied by similar pens, used for assorting and keeping the salmon during the spawning season; and close at hand is a rude shed built to shelter the operators while at work. It is during the last week in October that the first salmon enter the

GENERAL VIEW OF THE POND, SPAWNING SHED, AND SLUICE.

Vol. XLIX.—No. 289.—3

FEMALE SALMON AFTER
SPAWNING.THE MALE SALMON IN
NOVEMBER.

brook. After the 1st of November the occurrence there of an immature fish is very rare. By this fortunate circumstance the labor attending the taking of spawn is much simplified; for each female salmon can be relieved of her spawn as soon as she comes in hand, thus avoiding the repeated handling that would be necessary were part of the fish coming down the sluice to be immature. Both sexes come together. They are now as easily distinguished as are the cock and hen of the common fowl. The male has very bright colors, has long jaws, the lower one furnished with a hook that shuts into a cavity in the roof of the mouth—characteristics that he has assumed since June, when there was very little difference between the sexes. By the middle of November the spawning season is nearly at an end. Probably all the salmon are mature by that time; but under some circumstances the eggs are retained by the female for several weeks after they are ready to be laid, and they have been taken here as late as December.

The taking of spawn commonly proceeds from day to day as fast as the fish come down the sluice. When they are plenty the spawning shed is a busy place. As many as six hundred thousand eggs have been taken in a single day. A female salmon of the smallest size weighs at this season eight pounds, and yields about six thousand eggs. The largest thus far handled weighed twenty-two pounds, and yielded sixteen thousand eggs, which measured nearly four quarts, and subtracted six pounds from the weight of the fish.

From four to six men form a convenient working party. The fish are dipped out of the pens one by one, and brought to the principal operator, who sits on a stool with a shallow tin pan before him. First a female salmon is taken in hand, and her eggs pressed out into the pan without any water other than that contained in the viscid fluid that comes with them from the fish. In clear water the eggs would soon lose the capacity of fecundation, but in their natural fluid they retain it for a long time. As soon as the fish has yielded all her eggs she is slipped into a bag and weighed, placed on a bench and measured, marked by attaching a small stamped metal tag to the back fin, and placed in one of the pens, where she soon recovers from her exhaustion, and whence in due course of time she is turned out into the brook or carted down to the river. The eggs are also weighed, and then replaced before the operator, who now

takes a male salmon and presses his milt into the same pan. This is the most important part of the whole process, for without the fecundating influence of the milt the eggs would never develop into fish. It was formerly the practice to let eggs and milt fall from the fish into a dish of water; but the milt, when in water, loses the power of acting upon the eggs even quicker than the eggs lose the capacity of being acted upon, and it thus often happened that the intimate contact essential was not effected soon enough to insure fecundation. From this cause a large percentage of eggs commonly failed. A Russian gentleman made the discovery that if water were kept away from the eggs until fresh milt had come in contact with them, nearly all were fecundated. This is the method pursued at Bucksport, and with such success that, on the average, not more than two or three per cent. of the eggs fail to be fecundated. The rate of fecundation is obtained by very careful observation. At a certain stage of the development of a fecund egg the germ be-

gins to expand laterally, sending out a thin fold, which at last completely incloses the yolk. At any time during the growth of this fold the position of its advancing margin can be traced by a line of colored oil globules, arranged in a circle on the surface of the yolk. This circle is at first quite small, and surrounds the colored disk so plainly visible on the upper side of the yolk. It enlarges day by day, until it divides the surface of the yolk into two equal parts. As it progresses beyond this point it becomes smaller, and finally it closes entirely. This process begins, in water of the temperature of 43° F., at about the thirtieth day, and is completed in seven or eight days. As it never takes place in an unfecund egg, its occurrence is positive proof of fecundation. To observe it a strong light should be thrown up through the egg, and the most convenient way of effecting this is to place the egg over a hole in a piece of sheet metal, and hold it up to a window. To obtain the ratio of fecundation a definite number of eggs is examined from each lot, and the result made the basis of a strict calculation. After they have been treated with milt the pan is partly filled with water, and placed on a shelf in the spawning shed, where it is allowed to stand half an hour or longer, before it is carried to the hatching house.

As may be supposed, the salmon do not willingly submit to manipulation. They are very strong, particularly the males, and

occasionally offer the most violent resistance, struggling and squirming until the patience and strength of the operators are overtaxed, and their clothes well smeared with odorous slime. But if the weather be mild, and the fish come into the brook as fast as they are wanted, the work proceeds not only rapidly, but even merrily. Hard times come with cold weather, especially if at the same time the salmon are backward about running. Then every thing about the spawning shed is covered with ice, clothes are stiff with it, the wet fingers freeze to the utensils, and it is only with great care that the eggs themselves are kept from freezing. The pond is covered with ice. This must be broken up and got out of the way, or the seine must be drawn under it; at any rate, the seine must be drawn, and the salmon driven into the brook or swept ashore.

At last the out-door work is done, the salmon sent away, and all the eggs safely deposited in the hatching house. This is the principal building of the establishment, and is a few rods down stream from the spawning shed. Here is a large room, seventy feet by twenty-eight, whose floor is closely covered with wooden troughs. The distributing trough traverses the whole length of the building, standing close against the wall on one side. Into it are brought spring water and filtered and unfiltered brook water, the last in much greater volume than the others. Forty hatching troughs, each one foot wide, run across the room, having their

TAKING THE SPAWN.

THE HATCHING HOUSE.

heads against the distributing trough, from which they receive a constant supply of water, amounting in the aggregate to about ten thousand gallons per hour. The eggs lie in these troughs on trays made of wire-cloth smeared with a water-proof varnish, and tacked to a light wooden frame. A tray one foot wide and two feet long holds 4000 eggs. There are in most of these troughs two or three tiers of trays, one on top of another, so arranged that the water circulates freely among them. The eggs are as large as pease, or, to be more exact, an egg of average size measures a little less than a quarter of an inch in diameter. They are semi-transparent, and of a color varying from pink to salmon-color, or sometimes a deep orange-red. Very pretty objects they are.

From the time the eggs are deposited in the water a constant development goes on. On coming from the fish the outer shell is relaxed, and feels soft to the touch. After being impregnated and in the water a short time the eggs expand by absorbing water, until the shell is distended and feels very firm. After this there is no further change in size, but the embryo is steadily developing within. In spring water the eyes would become visible through the shell in about a month. But the water used here is so cold that the same stage of growth is not reached under two or three months, and the young fish hatched here, for the most part, leave the shell in April and May, about six months after the eggs are laid.

The water used for hatching is very cold, though not quite as cold as that used by Mr. Leonard at the Sebec Salmon-breeding Works, where the temperature has been above 33° but three days since November

15. At the Bucksport hatching house the temperature of the water ranges from 32½° to 34° F. through most of the winter. When the earliest eggs are first deposited it is about 44° F., and before the last of those kept here hatch out, early in May, it rises again to the same point. The lowest temperature of the whole season is experienced in April, when the snow and ice are melting.

Development goes on very slowly, and the eggs are not generally in the proper state for transportation, ac-

cording to the common standard—the coloring of the eyes—until February, at which time they are divided among the several patrons of the enterprise. Of those falling to the share of Maine in 1873 a portion were kept and hatched at Bucksport. The most forward of them began to hatch in March, but only a few individuals came out then, the fall of temperature that accompanied the opening of spring appearing to almost suspend growth. The hatching proceeded very slowly until the last week in April, when the ice was all thawed in the pond above, and the temperature began to rise. I do not know that there is any disadvantage connected with this low temperature. On the contrary, I think it quite likely that the delay of hatching until April and May is rather advantageous to young fish that are to be turned out to seek their own food. Fish hatched out in January, and grown to the feeding stage in February or early in March, must either be turned out into streams that are so cold as to arrest their growth and keep them a long time small and weak, besides being perhaps lacking in natural food, or they must be fed artificially. If the latter course be adopted, I fear the fish will be unfitted, to a certain extent, to take care of themselves. The natural date of hatching in these waters must correspond closely with that of those hatched artificially. Only a small part of the eggs are hatched here, however, all of those belonging to other States, and part of those belonging to Maine, being sent away during the winter and hatched elsewhere.

The present patrons of the enterprise are the Commissioners of Fisheries of all the New England States and of Michigan, and

the United States Commissioner of Fish and Fisheries. The latter, besides distributing large numbers of eggs among the rivers known to have been the natural homes of salmon, is trying the experiment of introducing them into the rivers of the Middle States, and into the tributaries of the great lakes. The eggs collected in 1872 were distributed as far south as Pennsylvania, and as far west as Wisconsin. In the month of February they are in a proper state for shipment, having attained that stage of development at which they can be handled without harm. For transportation they are packed up in wet bog-moss in boxes that are protected from the effects of extreme cold by an envelope of sawdust or some other non-conductor of heat, and in this way can be kept packed up for weeks, and sent hundreds of miles.

Though the aim of this establishment is the collection of salmon eggs on as large a scale as the funds at command will admit, the opportunities presented for the study of the natural history of the species are not neglected, it being wisely held that no sort of knowledge on the subject can come amiss, and that some of the new facts learned may prove of immense importance in the future prosecution of the art of fish-culture. At the present time the natural history of the salmon is involved in much obscurity, and it is hoped that the observations made here will contribute something toward clearing it up. It is with this view that pains are taken, after spawning, to mark each fish before it is set at liberty in such a way that if it be ever caught again it can be identified. The mode of marking now employed is the attachment of a small aluminum tag by means of fine platinum wire to the rear margin of the first dorsal fin. Each tag is stamped with a number, which is recorded, together with the sex, length, and weight of the fish, the date when liberated, and

other facts. When, therefore, one of these fish is caught again, a reference to the record will show the length of time intervening between the liberation and recapture of the fish, its rate of growth meanwhile, and various other facts. A reward is offered to all fishermen in Penobscot bay and river and adjacent waters for the delivery of any tagged salmon; and even if none should ever be caught, that fact will afford negative evidence of some value.

During the last session of the American Fish-culturists' Association, held in New York, February 10, Mr. Samuel Wilmot, of the Dominion government hatching house, situated at Newcastle, Ontario, stated that he had at different times marked salmon in various ways, principally by clipping their fins, and some of these marked fish had returned considerably increased in weight to their early play-ground. To which Mr. Seth Green responded, heartily, "That's so; I saw some of those marked ones, and it reminds me how I stood some long hours of watching, for several days, from among the branches of a tree into which I had climbed to get out of sight of two salmon—that was away back in 1835—that were working their spawn in the natural way. They would come to the trench which they had prepared, and, rubbing side by side, deposit their spawn. When they had finished, they covered it up and went off—so did I. That was in Wilmot's Creek." Mr. Green subsequently stated that the percentage of fish hatched in the natural way was almost insignificant as compared with that of those hatched by artificial means.

That the mature salmon returns to the waters in which it is hatched is attested by many competent observers, and it is also known that it returns, season after season, to its early spawning ground. M. De Lande fastened a copper ring round a salmon's tail, and found that for three successive seasons it returned to the same place. In some of

OVA AND PARR.

the rivers of the British Islands the salmon are marked annually, and some specimens have become so familiar that they are known by name.

The number of eggs collected at Bucksport during the first season was a million and a half. The second season was still more prosperous, and two millions and a quarter of eggs were obtained, at a cost of about \$3 50 per thousand, a very gratifying reduction from the old price. When it is mentioned that a considerable expenditure for permanent fixtures enters into the cost of these eggs, it appears by no means improbable that in future spawn will be collected at a still lower cost. As it is already, with proper facilities for hatching, and with good success therein, living salmon can be put into the rivers at the rate of two for a cent. Were all the young to grow, the two salmon would be worth say five dollars in four years. But as the majority of them will perish before reaching full size, let it be stated in another way. To put two thousand young salmon into a river costs ten dollars. If one out of a hundred survives, there will in four years be twenty adult salmon, worth fifty dollars, which may be regarded as the return from the investment of ten dollars. Truly the fish-culturist has a wide margin.

Although the establishment is now conducted on such a scale that it quite eclipses all other collections of spawn of sea-going salmon in America, except those of Mr. Stone in California, the superintendent of the works does not think it wise to rest contented with its present development status, but to enlarge until the eggs annually collected shall be counted by tens of millions. Then when the commissioners wish to restock a river with salmon, they can put in a million young at once, and a proper stream thus stocked, and reasonably protected by laws which are generally enforced, will quickly develop an abundant food supply. It is not expected—having in view the increased population—that salmon will ever swarm so thickly in our rivers as to require the insertion of the old clause which may be found in some of the apprentice papers of colonial date, “and

y^e lad may not be feed y^e salmon fishe but twice the week.”

Simple laws well enforced will, it is believed, afford quite sufficient protection to any suitable stream that may be each season supplied with any considerable number of parr (newly hatched salmon). Such water should be entirely free from nets from Saturday sundown until daybreak on the following Monday. This will permit the fish to ascend the river to chosen spawning grounds near the source of the stream.

The early Scotch laws have the Sabbath close time written, “Satterdaye's sloppe,” and in those days the fish laws were not fractured without personal peril or great cost. Alexander I. enacted this weekly freedom from nets forever. “The streame of the water sal be in all parts swa free that ane swine of the age of three years, well feed, may turn himself within the streame round about, swa that his snout nor taile sal not tuch the bank of the water.” James IV. made things still more uncomfortable for the breaker of fish laws, for he enacted that a third offense should receive capital punishment.

It is believed by many persons wise in piscatorial lore that the Hudson River, the Delaware, Susquehanna, Potomac, and possibly the James rivers, may be successfully stocked with salmon—not those from the Bucksport hatching house probably. Experiments now going rapidly forward with spawn from the Pacific coast are expected to confirm this theory, and eventually furnish our tables with fresh salmon which shall not be for the rich alone.

That the Hudson River ever abounded with salmon seems improbable, and the fact that any considerable number was ever taken therefrom is more than questioned by our best-informed scientists. Hendrick Hudson told a fish story when he wrote that he “tooke y^e salmon” in this water, and showed that he did not know a big river trout from a salmon.

The eggs distributed in 1873, numbering 1,241,800, were sent to every State in New England, and also to New York, New Jersey, Pennsylvania, Ohio, Michigan, and Wisconsin. The young fish hatched were in every instance set at liberty as soon as the yolk sac was absorbed. The whole number thus turned out was 876,000. The present season the number of eggs distributed will probably exceed 2,200,000, and, unless some extraordinary mishap interferes, the number of young fish will be more than double that of last year. The distribution is so wide that hardly any river receives an adequate stock, but in some instances the number will be sufficient to produce a decided impression.

NYMPHIDIA: THE COURT OF FAIRY.

By MICHAEL DRAYTON. BORN 1563. DIED 1631.

"As Imagination bodies forth
The forms of things unknown, the Poet's pen
Turns them to shapes, and gives to airy nothing
A local habitation and a name."

—*Midsummer Night's Dream.*

OLD Chancer doth of "*Topas*" tell,
Mad Rabl'ais of "*Pantagruell*,"
A later third of "*Dowsabell*,"

With such poor trifles playing:
Others the like have labour'd at,
Some of this thing, and some of that,
And many of they know not what,
But what they may be saying.

Another sort there be, that will
Be talking of the Fairies still,
Nor never can they have their fill,
As they were wedded to them;
No tales of them their thirst can slake,
So much delight therein they take,
And some strange thing they fain would make,
Knew they the way to do them.

Then since no Muse hath been so bold,
Or of the later, or the old,
Those elvish secrets to unfold,
Which lie from others' reading;
My active Muse to light shall bring
The court of that proud Fairy King,
And tell there of the revelling.
Jove prosper my proceeding!

And thou, NYMPHIDIA, gentle Fay,
Which meeting me upon the way,
These secrets didst to me bewray,
Which now I am in telling;
My pretty light fantastic Maid,
I here invoke thee to my aid,
That I may speak what thou hast said,
In numbers smoothly swelling.

This palace standeth in the air,
By necromancy placed there,
That it no tempest needs to fear,
Which way so e'er it blow it.
And somewhat southward tow'rd the noon,
Whence lies a way up to the moon,
And thence the Fairy can as soon
Pass to the earth below it.

The walls of spiders' legs are made,
Well mortised and finely laid;
He was the master of his trade,
It curiously that builded:
The windows of the eyes of cats,
And for the roof, instead of slats;
Is cover'd with the skins of bats,
With moonshine that are gilded.

Hence Oberon him sport to make,
(Their rest when weary mortals take)
And none but only Fairies wake,
Descendeth for his pleasure:
And Mab his merry Queen by night
Bestrides young folks that lie upright,
(In elder times the mare that hight)
Which plagues them out of measure.

Hence shadows, seeming idle shapes,
Of little frisking elves and apes,
To earth do make their wanton 'scapes,
As hope of pastime hastes them;
Which maids think on the hearth they see,
When fires well near consumed be,
There dancing hays by two and three,
Just as their fancy casts them.

These make our girls their sluttish rue,
By pinching them both black and blue,
And put a penny in their shoe,
The house for cleanly sweeping:
And in their courses make that round,
In meadows and in marshes found,
Of them so call'd, the *Fairy Ground*,
Of which they have the keeping.

These when a child haps to be got,
Which after proves an idiot,
When folk perceive it thrive not,
The fault therein to smother,
Some silly doting brainless calf,
That understands things by the half,
Say that the Fairy left this oaf,
And took away the other.

But listen, and I shall you tell
A chance in Fairy that befell,
Which certainly may please some well,
In love and arms delighting,
Of Oberon that jealous grew,
Of one of his own Fairy crew,
Too well (he fear'd) his Queen that knew,
His love but ill requiting.

Pigwiggin was this Fairy knight,
One wond'rous gracious in the sight
Of fair Queen Mab, which, day and night,
He amorously observed;
Which made King Oberon suspect
His service took too good effect,
His sauciness had often check't,
And could have wish'd him starved.

Pigwiggin gladly would commend
Some token to Queen Mab to send,
If sea, or land him aught could lend,
Were worthy of her wearing:
At length this lover doth devise
A bracelet made of emmets' eyes,
A thing he thought that she would prize,
No whit or state impairing.

And to the Queen a letter writes,
Which he most curiously indites,
Conjuring her by all the rites
Of Love, she would be pleased
To meet him, her true servant, where
They might, without suspect or fear,
Themselves to one another clear,
And have their poor hearts eased.

At midnight the appointed hour,
 "And for the Queen a fitting bower,"
 Quoth he, "is that fair cowslip flower,
 On Hipcut hill that groweth;
 In all your train there's not a Fay,
 That ever went to gather May,
 But she hath made it in her way,
 The tallest there that groweth."

When by Tom Thum, a Fairy page,
 He sent it, and doth him engage,
 By promise of a mighty wage,
 It secretly to carry:
 Which done, the Queen her maids doth
 call,
 And bids them to be ready all;
 She would go see her Summer Hall,
 She could no longer tarry.

Her chariot ready straight is made,
 Each thing therein is fitting laid,
 That she by nothing might be staid,
 For nought must her be letting;
 Four nimble gnats the horses were,
 Their harnesses of gossamere,
 Fly Cranion her charioteer,
 Upon the coach-box getting.

Her chariot of a snail's fine shell,
 Which for the colours did excel;
 The fair Queen Mab becoming well,
 So lively was the limning:
 The seat the soft wool of the bee;
 The cover (gallantly to see)
 The wing of a pied butterfly;
 I trow t'was simple trimming.

The wheels compos'd of crickets' bones,
 And daintily made for the nonce;
 For fear of rattling on the stones,
 With thistle-down they shod it;
 For all her maidens much did fear,
 If Oberon had chanc'd to hear,
 That Mab his Queen should have been there,
 He would not have abode it.

She mounts her chariot with a trice,
 Nor would she stay for no advice,
 Until her maids, that were so nice,
 To wait on her were fitted;
 But ran herself away alone;
 Which when they heard there was not one,
 But hasted after to begone,
 As she had been diswitted.

Hop, and Mop, and Drop so clear,
 Pip, and Trip, and Skip that were
 To Mab their sovereign ever dear;
 Her 'special maids of honour:
 Fib, and Tib, and Pink, and Pin,
 Tick, and Quick, and Jill, and Jin,
 Tit, and Nit, and Wap, and Win,
 The train that wait upon her.

Upon a grasshopper they got,
 And what with amble, and with trot,
 For hedge nor ditch they spared not,
 But after her they hie them:
 A cobweb over them they throw,
 To shield the wind if it should blow,
 Themselves they wisely could bestow,
 Lest any should espy them.

But let us leave Queen Mab awhile,
 Through many a gate, o'er many a stile,
 That now had gotten by this wile
 Her dear Pigwigin kissing;
 And tell how Oberon doth fare,
 Who grew as mad as any hare,
 When he had sought each place with care,
 And found his Queen was missing.

By grisly Pluto he doth swear,
 He rent his clothes and tore his hair;
 And as he runneth here and there,
 An acorn cup he greeteth;
 Which soon he taketh by the stalk;
 About his head he lets it walk,
 Nor doth he any creature balk,
 But lays on all he meeteth.

The Tuscan poet doth advance
The frantic Paladin of France,
And those more ancient do inance
Alcides in his fury:
And others Ajax Telamon;
But to this time there hath been none,
So Bedlam as our Oberon,
Of which I dare assure you.

And first encountering with a Wasp,
He in his arms the fly doth clasp,
As though his breath he forth would
grasp,
Him for Pigwiggin taking:
"Where is my wife, thou rogue?" quoth he,
"Pigwiggin she is come to thee;
Restore her, or thou diest by me!"
Whereat the poor Wasp quaking,

Cries, "Oberon, great Fairy King,
Content thee, I am no such thing,
I am a Wasp, behold my sting!"
At which the Fairy started:
When soon away the Wasp doth go:
Poor wretch was never frightened so;
He thought his wings were much too
slow,
O'erjoy'd they so were parted.

He next upon a Glow-worm light,
(You must suppose it now was night,)
Which, for her hinder part was bright,
He took to be a devil:
And furiously doth her assail,
For carrying fire in her tail;
He thrash'd her rough coat with his flail;
The mad King fear'd no evil.

"O," quoth the Glow-worm, "hold thy hand,
Thou puissant King of Fairy Land.
Thy mighty strokes who may withstand?
Hold, or of life despair I!"
Together then herself doth roll,
And tumbling down into a hole,
She seem'd as black as any cole,
Which vex'd away the Fairy.

From thence he ran into a hive;
Amongst the bees he letteth drive;
And down their combs begins to rive,
All likely to have spoiled;
Which with their wax his face besmear'd,
And with their honey daub'd his beard,
It would have made a man afeard,
To see how he was moiled.

A new adventure him betides;
He met an ant, which he bestrides,
And post thereon away he rides,
Which with his haste doth stumble;
And came full over on her snout,
Her heels so threw the dirt about,
For she by no means could get out,
But over him doth tumble.

And being in this piteous case,
And all be-slurred head and face,
On runs he in this wild-goose chase,
As here and there he rambles:
Half blind, against a mole-hill hit,
And for a mountain taking it,
For all he was out of his wit,
Yet to the top he scrambles.

And being gotten to the top,
Yet there himself he could not stop,
But down on th' other side doth chop,
And to the foot came rumbling:
So that the grubs, therein that bred,
Hearing such turmoil over head,
Thought surely they had all been dead;
So fearful was the jumbling.

And falling down into a lake,
Which him up to the neck doth take,
His fury somewhat it doth slake;
He calleth for a ferry;
Where you may some recovery note;
What was his club he made his boat;
And in his oaken cup doth float,
As safe as in a wherry.

Men talk of the adventures strange
Of Don Quixoit, and of their change
Through which he armed oft did range,
Of Sancho Pancha's travel:
But should a man tell every thing,
Done by this frantic Fairy King,
And them in lofty numbers sing,
It well his wits might gravel.

Scarce set on shore, but therewithall
He meeteth Puck, which most men call
Hobgoblin, and on him doth fall,
With words from frenzy spoken;
"Oh, oh," quoth Hob, "God save thy grace!
Who drest thee in this piteous case?
He thus that spoil'd my sovereign's face,
I would his neck were broken!"

This Puck seems but a dreaming dolt,
Still walking like a ragged colt,
And oft out of a bush doth bolt,
Of purpose to deceive us:
And leading us makes us to stray
Long winters nights, out of the way;
And when we stick in mire and clay,
Hob doth with laughter leave us.

"Dear Puck," quoth he, "my wife is gone,
As e'er thou lov'st King Oberon,
Let every thing but this alone
With vengeance, and pursue her;
Bring her to me alive or dead,
Or that vile thief, Pigwigin's head,
That villain hath defiled my bed;
He to this folly drew her."

Quoth Puck, "My Liege, I'll never lin,
But I will thorough thick and thin,
Until at length I bring her in;
My dearest Lord ne'er doubt it."
Thorough brake, thorough briar,
Thorough muck, thorough mire,
Thorough water, thorough fire;
And thus goes Puck about it.

This thing NYMPHIDIA overheard,
That on this mad King had a guard,
Not doubting of a great reward,
For first this business broaching;
And through the air away doth go,
Swift as an arrow from the bow,
To let her sovereign Mab to know,
What peril was approaching.

The Queen, bound with Love's powerful charm,
Sate with Pigwiggin arm in arm;
Her merry maids, that thought no harm,
About the room were skipping:
A humble-bee, their minstrel, play'd
Upon his hautboy; ev'ry maid
Fit for this revel was array'd,
The hornpipe neatly tripping.

In comes NYMPHIDIA, and doth cry,
"My sovereign for your safety fly,
For there is danger but too nigh;
I posted to forewarn you:
The King hath sent Hobgoblin out,
To seek you all the fields about;
And of your safety you may doubt,
If he but once discern you."

When, like an uproar in a town,
Before them every thing went down;
Some tore a ruff, and some a gown,
'Gainst one another justling:
They flew about like chaff i'th' wind;
For haste some left their masks behind;
Some could not stay their gloves to find;
There never was such bustling.

Forth ran they, by a secret way,
Into a brake that near them lay;
Yet much they doubted there to stay,
Lest Hob should hap to find them:
He had a sharp and piercing sight,
All one to him the day and night;
And therefore were resolv'd, by flight,
To leave this place behind them.

At length one chanc'd to find a nut,
In th' end of which a hole was cut,
Which lay upon a hazel root,
There scatter'd by a squirrel:
Which out the kernel gotten had;
When quoth this Fay, "Dear Queen, be glad;
Let Oberon be ne'er so mad,
I'll set you safe from peril.

Come all into this nut," quoth she,
"Come closely in; be rul'd by me;
Each one may here a chooser be,
For room ye need not wrestle:
Nor need ye be together heap'd;"
So one by one therein they crept,
And lying down they soundly slept,
And safe as in a castle.

NYMPHIDIA, that this while doth watch,
Perceiv'd if Puck the Queen should catch
That he should be her over-match,
Of which she well bethought her;
Found it must be some powerful charm,
The Queen against him that must arm,
Or surely he would do her harm,
For thoroughly he had sought her.

And listening if she ought could hear,
That her might hinder, or might fear;
But finding still the coast was clear,
Nor creature had descried her;
Each circumstance and having scann'd,
She came thereby to understand,
Puck would be with them out of hand,
When to her charms she hied her.

And first her fern seed doth bestow,
The kernel of the missleto;
And here and there as Puck should go,
With terror to affright him,
She night-shade strews to work him ill,
Therewith her vervain and her dill,
That hind'reth witches of their will,
Of purpose to despight him.

Then sprinkles she the juice of rue,
That groweth underneath the yew;
With nine drops of the midnight dew,
From lunary distilling;
The molewarp's brain mixt therewithall;
And with the same the pismire's gall:
For she in nothing short would fall,
The Fairy was so willing.

Then thrice under a briar doth creep,
Which at both ends was rooted deep,
And over it three times she leap;
Her magic much availing:
Then on Proserpina doth call,
And so upon her spell doth fall,
Which here to you repeat I shall,
Not in one tittle failing.

"By the croaking of the frog;
By the howling of the dog;
By the crying of the hog,
Against the storm arising:
By the evening curfew bell,
By the doleful dying knell,
O let this my direful spell,
Hob, hinder thy surprising!

By the mandrake's dreadful groans;
By the lubrican's sad moans;
By the noise of dead mens' bones,
In charnel houses ratling:
By the hissing of the snake,
The rustling of the fire-drake,
I charge thee thou this place forsake,
Nor of Queen Mab be pratling!

By the whirlwind's hollow sound,
By the thunder's dreadful stound,
Yells of spirits under ground,
I charge thee not to fear us:
By the screech-owl's dismal note,
By the black night-raven's throat,
I charge thee, Hob, to tear thy coat
With thorns, if thou come near us!"

Her spell thus spoke, she stept aside,
And in a chink herself doth hide,
To see there of what would betide,
For she doth only mind him:
When presently she Puck espies,
And well she mark'd his gloating eyes,
How under every leaf he pries,
In seeking still to find them.

But once the circle got within,
The charms to work do straight begin,
And he was caught as in a gin;
For as he thus was busy,
A pain he in his head-piece feels,
Against a stubbed tree he reels,
And up went poor Hobgoblin's heels,
Alas! his brain was dizzy!

At length upon his feet he gets,
Hobgoblin fumes, Hobgoblin frets;
And as again he forward sets,
And through the bushes scrambles,
A stump doth trip him in his pace;
Down comes poor Hob upon his face,
And lamentably tore his case,
Amongst the briars and brambles.

"A plague upon Queen Mab!" quoth he:
"And all her maids where'er they be,
I think the devil guided me,
To seek her so provok'd!"
Where, stumbling at a piece of wood,
He fell into a ditch of mud,
Where to the very chin he stood,
In danger to be choak'd.

Now worse than e'er he was before,
Poor Puck doth yell, poor Puck doth roar;
That wak'd Queen Mab, who doubted sore
Some treason had been wrought her:
Until NYMPHIDIA told the Queen,
What she had done, what she had seen,
Who then had well near crack'd her spleen
With very extreme laughter.

But leave we Hob to clamber out,
Queen Mab and all her Fairy rout;
And come again to have a bout
With Oberon yet madding:
And with Pigwiggin now distraught,
Who much was troubled in his thought,
That he so long the Queen had sought,
And through the fields was gadding.

And as he runs he still doth cry,
"King Oberon I thee defy,
And dare thee here in arms to try,
For my dear Lady's honour:
For that she is a Queen right good,
In whose defence I'll shed my blood,
And that thou in this jealous mood
Hast laid this slander on her."

And quickly arms him for the field,
A little cockle-shell his shield,
Which he could very bravely wield;
Yet could it not be pierc'd:
His spear a bent both stiff and strong,
And well near of two inches long;
The pile was of a horse-fly's tongue,
Whose sharpness nought revers'd.

And puts him on a coat of mail,
Which was of a fish's scale,
That when his foe should him assail,
No point should be prevailing:
His rapier was a hornet's sting;
It was a very dangerous thing,
For if he chanc'd to hurt the King,
It would be long in healing.

His helmet was a beetle's head,
Most horrible and full of dread,
That able was to strike one dead,
Yet did it well become him:
And for a plume a horse's hair,
Which, being tossed with the air,
Had force to strike his foe with fear,
And turn his weapon from him.

Himself he on an earwig set,
Yet scarce he on his back could get,
So oft and high he did curvet,
Ere he himself could settle:
He made him turn, and stop, and bound,
To gallop, and to trot the round,
He scarce could stand on any ground,
He was so full of mettle.

When soon he met with Tomalin,
One that a valiant knight had been,
And to King Oberon of kin;
Quoth he, "Thou manly Fairy,
Tell Oberon I come prepar'd,
Then bid him stand upon his guard;
This hand his baseness shall reward,
Let him be ne'er so wary.

Say to him thus, that I defy
His slanders and his infamy,
And as a mortal enemy
Do publicly proclaim him:
Withall that if I had mine own,
He should not wear the Fairy crown,
But with a vengeance should come down,
Nor we a king should name him."

This Tomalin could not abide,
To hear his sovereign vilified;
But to the Fairy Court him hied,
(Full furiously he posted,)
With every thing Pigwiggin said:
How title to the crown he laid,
And in what arms he was array'd,
As how himself he boasted.

Twixt head and foot, from point to point,
He told the arming of each joint,
In every piece how neat and quaint,
For Tomalin could do it:
How fair he sat, how sure he rid,
As of the courser he bestrid,
How managed, and how well he did,
The King which listen'd to it.

Quoth he, "Go, Tomalin, with speed,
Provide me arms, provide my steed,
And every thing that I shall need;
By thee I will be guided:
To straight account call thou thy wit,
See there be wanting not a whit,
In every thing see thou me fit,
Just as my foes provided."

Soon flew this news through Fairy Land,
Which gave Queen Mab to understand
The combat that was then in hand
Betwixt those men so mighty:
Which greatly she began to rue,
Perceiving that all Fairy knew,
The first occasion from her grew
Of these affairs so weighty.

Wherefore attended with her maids,
Through fogs, and mists, and damps she
wades,
To Proserpine the Queen of Shades,
To treat, that it would please her,
The cause into her hands to take,
For ancient love and friendship's sake,
And soon thereof an end to make,
Which of much care would ease her.

Their seconds minister an oath,
Which was indifferent to them both,
That on their knightly faith and troth
No magic them supplied;
And sought them that they had no charms,
Wherewith to work each others harms,
But came with simple open arms
To have their causes tried.

Together furiously they ran,
That to the ground came horse and man;
The blood out of their helmets span,
So sharp were their encounters;
And though they to the earth were thrown,
Yet quickly they regain'd their own,
Such nimbleness was never shown,
They were two gallant mounters.

A while there let we Mab alone,
And come we to King Oberon,
Who, arm'd to meet his foe, is gone,
For proud Pigwigginn crying:
Who sought the Fairy King as fast,
And had so well his journies cast,
That he arrived at the last,
His puissant foe espying:

Stout Tomalin came with the King,
Tom Thum doth on Pigwigginn bring,
That perfect were in every thing,
To single fights belonging:
And therefore they themselves engage,
To see them exercise their rage,
With fair and comely equipage,
Not one the other wronging.

So like in arms these champions were,
As they had been a very pair,
So that a man would almost swear,
That either had been either;
Their furious steeds began to neigh,
That they were heard a mighty way;
Their staves upon their rests they lay;
Yet ere they flew together,

When in a second course again
They forward came with might and main,
Yet which had better of the twain,
The seconds could not judge yet;
Their shields were into pieces cleft,
Their helmets from their heads were reft,
And to defend them nothing left,
These champions would not budge yet.

Away from them their staves they threw,
Their cruel swords they quickly drew,
And freshly they the fight renew;
They every stroke redoubled:
Which made Proserpina take heed,
And make to them the greater speed,
For fear lest they too much should bleed,
Which wondrously her troubled.

When to th' infernal Styx she goes,
She takes the fogs from thence that rose,
And in a bag doth them enclose:
When well she had them blended,
She hies her then to Lethe spring,
A bottle and thereof doth bring,
Wherewith she meant to work the thing,
Which only she intended.

Now Proserpine with Mab is gone,
Unto the place where Oberon
And proud Pigwigin, one to one,
Both to be slain were likely:
And there themselves they closely hide,
Because they would not be espied;
For Proserpine meant to decide
The matter very quickly.

And suddenly unties the poke,
Which out of it sent such a smoke,
As ready was them all to choke,
So grievous was the pother;
So that the knights each other lost,
And stood as still as any post;
Tom Thum, nor Tomalin could boast
Themselves of any other.

But when the mist 'gan somewhat cease,
Proserpina commandeth peace;
And that a while they should release,
Each other of their peril:
"Which here," quoth she, "I do proclaim
To all in dreadful Pluto's name,
That as ye will eschew his blame,
You let me hear the quarrel:

But here yourselves you must engage,
Somewhat to cool your spleenish rage;
Your grievous thirst and to assuage,
That first you drink this liquor,
Which shall your understanding clear,
As plainly shall to you appear;
Those things from me that you shall hear,
Conceiving much the quicker."

This Lethe water, you must know,
The memory destroyeth so,
That of our weal, or of our woe,
It all remembrance blotted;
Of it nor can you ever think,
For they no sooner took this drink,
But nought into their brains could
sink,
Of what had them besotted.

King Oberon forgotten had,
That he for jealousy ran mad,
But of his Queen was wondrous glad,
And ask'd how they came thither:
Pigwigin likewise doth forget
That he Queen Mab had ever met;
Or that they were so hard beset,
When they were found together.

Nor neither of them both had thought,
That e'er they each had other sought,
Much less that they a combat fought,
But such a dream were lothing:
Tom Thum had got a little sup,
And Tomalin scarce kist the cup,
Yet had their brains so sure lockt up,
That they remember'd nothing.

Queen Mab and her light maids, the while,
Amongst themselves do closely smile,
To see the King caught with this wile,
With one another jesting:
And to the Fairy Court they went,
With mickle joy and merriment,
Which thing was done with good intent,
And thus I left them feasting.

"HE SAW HER HEAD FALL."

CHAPTER XLI.

A REVELATION.

IF any thing could have added to the misery of Edith and her general despondency, it would have been the revelations of Miss Fortescue. It had certainly been bad enough to recall the treachery of a false friend; but the facts as just revealed went far beyond what she had imagined. They revealed such a long course of persistent deceit, and showed that she had been subject to such manifold, long-sustained, and comprehensive lying, that she began to lose faith in human nature. Whom now could she believe? Could she venture to put confidence in this confession of Miss Fortescue? Was that her real name, and was this her real story, or was it all some new piece of acting, contrived by this all-accomplished actor for the sake of dragging her down to deeper abysses of woe? She felt herself to be surrounded by remorseless enemies, all of whom were plotting against her, and in whose hearts there was no possibility of pity or remorse. Wiggins, the archenemy, was acting a part which was mysterious just now, but which nevertheless, she felt sure, was aimed at her very life. Mrs. Dunbar, she knew, was more open in the manifestation of her feelings, for she had taken up the cause of the murdered man with a warmth and vindictive zeal that showed Edith plainly what she might expect from

her. Her only friend, Miss Plympton, was still lost to her; and her illness seemed probable, since, if it were not so, she would not keep aloof from her at such a moment as this. Hopeless as she had been of late, she now found that there were depths of despair below those in which she had thus far been—"in the lowest deep, a lower deep."

Such were her thoughts and feelings through the remainder of that day and through the following night. But little sleep came to her. The future stood before her without one ray of light to shine through its appalling gloom. On the next day her despair seemed even greater; her faculties seemed benumbed, and a dull apathy began to settle down over her soul.

From this state of mind she was roused by the opening of the door and the entrance of a visitor. Turning round, she saw Wiggins.

This was the first time that she had seen him since she left Dalton Hall, and in spite of that stolid and apathetic indifference which had come to her, she could not help being struck by the change which had come over him. His face seemed whiter, his hair grayer, his form more bent; his footsteps were feeble and uncertain; he leaned heavily upon his walking-stick; and in the glance that he turned toward her there was untold sympathy and compassion, together with a timid supplication that was unlike any thing which she had seen in him before.

Edith neither said any thing nor did any thing. She looked at him with dull indifference. She did not move. The thought came to her that this was merely another move in that great game of treachery and fraud to which she had been a victim; that here was the archtraitor, the instigator of all the lesser movements, who was coming to her in order to carry out some necessary part.

Wiggins sat down wearily upon one of the rude chairs of the scantily furnished room, and after a brief silence, looking at her sadly, began.

"I know," said he, "how you misunderstand me, and how unwelcome I must be; but I had to come, so as to assure you that I hope to find this man who is missing. I—I hope to do so before the—the trial. I have been searching all along, but without success—thus far. I wish to assure you that I have found out a way by which you—will be saved. And if you believe me, I trust that you will—try—to—cherish more hope than you appear to be doing."

He paused.

Edith said nothing at all. She was silent

partly out of apathy, and partly from a determination to give him no satisfaction, for she felt that any words of hers, no matter how simple, might be distorted and used against her.

Wiggins looked at her with imploring earnestness, and seemed to wait for her to say something. But finding her silent, he went on:

"Will you let me ask you one question? and forgive me for asking it; but it is of some importance to—to me—and to you. It is this: Did—did you see him at all—that night?"

"I have been warned," replied Edith, in a dull, cold tone, "to say nothing, and I intend to say nothing."

Wiggins sighed.

"To say nothing," said he, "is not always wise. I once knew a man who was charged with terrible crimes—crimes of which he was incapable. He was innocent, utterly. Not only innocent, indeed, but he had fallen under this suspicion, and had become the object of this charge, simply on account of his active efforts to save a guilty friend from ruin. His friend was the guilty one, and his friend was also his sister's husband; and this man had gone to try and save his friend, when he himself was arrested for that friend's crimes."

Wiggins did not look at Edith; his eyes were downcast. He spoke in a tone that seemed more like a soliloquy than any thing else. It was a tone, however, which, though low, was yet tremulous with ill-suppressed agitation.

"He was accused," continued Wiggins, "and if he had spoken and told what he knew, he might have saved his life. But if he had done this he would have had to become a witness, and stand up in court and say that which would ruin his friend. And so he could not speak. His lips were sealed. To speak would have been to inform against his friend. How could he do that? It was impossible. Yet some may think—you may think—that this man did wrong in allowing himself to be put in this false position. You may say that he had more than himself to consider—he had his family, his name, his—his wife, his child!"

"Yes," resumed Wiggins, after a long pause, "this is all true, and he did consider them, all—all—all! He did not trifle with his family name and honor, but it was rather on account of the pride which he took in these that he kept his silence. He was conscious of his perfect innocence. He could not think it possible that such charges could be carried out against one like himself. He believed implicitly in the justice of the courts of his country. He thought that in a fair trial the innocent could not possibly be proclaimed guilty. More than all, he thought that his proud name, his stainless character, and even his wealth and posi-

tion, would have shown the world that the charges were simply impossible. He thought that all men would have seen that for him to have done such things would involve insanity."

As Wiggins said this his voice grew more earnest and animated. He looked at Edith with his solemn eyes, and seemed as though he was pleading with her the cause of his friend—as though he was trying to show her how it had happened that the father had dishonored the name which the child must bear—as though he was justifying to the daughter, Edith Dalton, the acts of the father, Frederick Dalton.

"So he bore it all with perfect calmness," continued Wiggins, "and had no doubt that he would be acquitted, and thought that thus he would at least be able, without much suffering, to save his friend from ruin most terrific—from the condemnation of the courts and the fate of a felon."

Wiggins paused once more for some time. He was looking at Edith. He had expected some remark, but she had made none. In fact, she had regarded all this as a new trick of Wiggins—a transparent one too—the aim of which was to win her confidence by thus pretending to vindicate her father. He had already tried to work on her in that way, and had failed; and on this occasion he met with the same failure.

"There is no occasion for you to be silent, I think," said Wiggins, turning from the subject to the situation of Edith. "You have no friend at stake; you will endanger no one, and save yourself, by telling whether you are innocent or not."

These last words roused Edith. It was an allusion to her possible guilt. She determined to bring the interview to a close. She was tired of this man and his attempts to deceive her. It was painful to see through all this hypocrisy and perfidy at the very moment when they were being used against herself.

She looked at him with a stony gaze, and spoke in low, cold tones as she addressed him. "This is all useless. I am on my guard. Why you come here I do not know. Of course you wish to entrap me into saying something, so that you may use my words against me at the trial. You ask me if I saw this man on that night. You ask me if I am innocent. You well know that I am innocent. You, and you only, know who saw him last on that night; for as I believe in my own existence, so I believe, and affirm to your face, that this Leon Dudleigh was murdered by you, and you only!"

He looked at her fixedly as she said this, returning her stony gaze with a mournful look—a pitying look, full of infinite sadness and tenderness. He raised his hand deprecatingly, but said nothing until she had uttered those last words.

"Stop!" he said, in a low voice—"stay! I can not bear it."

He rose from his seat and came close to her. He leaned upon his stick heavily, and looked at her with eyes full of that same strange, inexplicable tenderness and compassion. Her eyes seemed fascinated by his, and in her mind there arose a strange bewilderment, an expectation of something she knew not what.

"Edith," said he, in a sweet and gentle voice, full of tender melancholy—"Edith, it would be sin in me to let you any longer heap up matter for future remorse; and even though I go against the bright hope of my life in saying this now, yet I must. Edith—"

He paused, looking at her, while she regarded him with awful eyes.

"Edith!" he said again—"my—my—child!"

There were tears in his eyes now, and there was on his face a look of unutterable love and unspeakable pity and forgiveness. He reached out his hand and placed it tenderly upon her head.

"Edith," he said again, "my child, you will never say these things again. I—I do not deserve them. I—am your—your father, Edith!"

At these words a convulsive shudder passed through Edith. He felt her frail form tremble, he saw her head fall, and heard a low sob that seemed torn from her.

She needed no more words than these. In an instant she saw it all; and though bewildered, she did not for a moment doubt his words. But her whole being was overwhelmed by a sudden and a sharp agony of remorse; for she had accustomed herself to hate this man, and the irrepressible tokens of a father's love she had regarded as hypocrisy. She had never failed to heap upon that reverend head the deepest scorn, contumely, and insult. But a moment before she had hurled at him a terrible accusation. At him! At whom? At the man whose mournful destiny it had been all along to suffer for the sins of others; and she it was who had flung upon him an additional burden of grief.

But with all her remorse there were other feelings—a shrinking sense of terror, a recoil from this sudden discovery as from something abhorrent. This her father! That father's face and form had been stamped in her memory. For years, as she had lived in the hope of seeing him, she had quickened her love for him and fed her hopes from his portrait. But how different was this one! What a frightful change from the father that lived in her memory! The one was a young man in the flush and pride of life and strength—the other a woe-worn, grief-stricken sufferer, with reverend head, bowed form, and trembling limbs. Besides, she had long

regarded him as dead; and to see this man was like looking on one who had risen from the dead.

In an instant, however, all was plain, and together with the discovery there came the pangs of remorse and terror and anguish. She could understand all. He, the escaped convict, had come to England, and was supposed to be dead. He had lived, under a false name, a life of constant and vigilant terror. He kept his secret from all the world. Oh, if he had only told her! Now the letter of Miss Plympton was all plain, and she wondered how she had been so blind.

"Oh!" she moaned, in a scarce audible voice, "why did you not tell me?"

"Oh, Edith darling! my child! my only love!" murmured Frederick Dalton, bending low over her, and infolding her trembling frame in his own trembling arms; "my sweet daughter, if you could only have known how I yearned over you! But I delayed to tell you. It was the one sweet hope of my life to redeem my name from its foul stain, and then declare myself. I wanted you to get your father back as he had left you, without this abhorrent crime laid to his charge. I did wrong not to trust you. It was a bitter, bitter error. But I had so set my heart on it. It was all for your sake, Edith—all, darling, for your sake!"

Edith could bear no more. Every one of these words was a fresh stab to her remorseful heart—every tone showed to her the depth of love that lay in that father's heart, and revealed to her the suffering that she must have caused. It was too much; and with a deep groan she sank away from his arms upon the floor. She clasped his knees—she did not dare to look up. She wished only to be a suppliant. He himself had prophesied this. His terrible warnings sounded even now in her ears. She had only one thought—to humble herself in the dust before that injured father.

Dalton tried to raise her up.

"My darling!" he cried, "my child! you must not—you will break my heart!"

"Oh," moaned Edith, "if it is not already broken, how can you ever forgive me!—how can you call me your child?"

"My child! my child!" said Dalton. "It was for you that I lived. If it had not been for the thought of you, I should have died long since. It was for your sake that I came home. It is for you only that I live now. There is nothing for me to forgive. Look up at me. Let me see your darling face. Let me hear you say one word—only one word—the word that I have hungered and thirsted to hear. Call me father."

"Father! oh, father! dear father!" burst forth Edith, clinging to him with convulsive energy, and weeping bitterly.

"Oh, my darling!" said Dalton, "I was to

blame. How could you have borne what I expected you to bear, when I would not give you my confidence? Do not let us speak of forgiveness. You loved your father all the time, and you thought that I was his enemy and yours."

Gradually Edith became calmer, and her calmness was increased by the discovery that her father was painfully weak and exhausted. He had been overwhelmed by the emotions which this interview had called forth. He now sat gazing at her with speechless love, holding her hands in his, but his breath came and went rapidly, and there was a feverish tremulousness in his voice and a flush on his pale cheeks which alarmed her. She tried to lessen his agitation by talking about her own prospects, but Dalton did not wish to.

"Not now, daughter," he said. "I will hear it all some other time. I am too weary. Let me only look at your dear face, and hear you call me by that sweet name, and feel my child's hands in mine. That will be bliss enough for this day. Another time we will speak about the—the situation that you are in."

As he was thus agitated, Edith was forced to refrain from asking him a thousand things which she was longing to know. She wished to learn how he had escaped, how he had made it to be believed that he was dead, and whether he was in any present danger. But all this she had to postpone. She had also to postpone her knowledge of that great secret—the secret that had baffled her, and which he had preserved inviolable through all these years. She now saw that her suspicions of the man "John Wiggins" must have been unfounded, and indeed the personality of "Wiggins" became a complete puzzle to her.

He bade her a tender adieu, promising to come early on the following day.

But on the following day there were no signs of him. Edith waited in terrible impatience, which finally deepened into alarm as his coming was still delayed. She had known so much of sorrow that she had learned to look for it, and began to expect some new calamity. Here, where she had found her father, where she had received his forgiveness for that which would never cease to cause remorse to herself, here, in this moment of respite from despair, she saw the black prospect of renewed misery. It was as though she had found him for a moment, only to lose him forever.

Toward evening a note was sent to her. She tore it open. It was from Mrs. Dunbar, and informed her that her father was quite ill, and was unable to visit her, but hoped that he might recover.

After that several days passed, and she heard nothing. At length another note came informing her that her father had

been dangerously ill, but was now convalescent.

Other days passed, and Edith heard regularly. Her father was growing steadily better. On one of these notes he had written his name with a trembling hand.

And so amidst these fresh sorrows, and with her feelings ever alternating between hope and despair, Edith lingered on through the time that intervened until the day of the trial.

CHAPTER XLII.

THE TRIAL.

At length the day for the trial arrived, and the place was crowded. At the appearance of Edith there arose a murmur of universal sympathy and pity. All the impressions which had been formed of her were falsified. Some had expected to see a coarse masculine woman; others a crafty, sinister face; others an awkward, ill-bred rustic, neglected since her father's trial by designing guardians. Instead of this there appeared before them a slender, graceful, youthful form, with high refinement and perfect breeding in every outline and movement. The heavy masses of her dark hair were folded across her brow, and wreathed in voluminous folds behind. Her pallid face bore traces of many griefs through which she had passed, and her large spiritual eyes had a piteous look as they wandered for a moment over the crowd.

No one was prepared to see any thing like this, and all hearts were at once touched. It seemed preposterous to suppose that one like her could be otherwise than innocent.

The usual formulas took place, and the trial began. The witnesses were those who had already been examined. It was rumored that Sir Lionel Dudley was to be brought forward, and "Wiggins," and Mrs. Dunbar, but not till the following day.

At the end of that day the opinion of the public was strongly in favor of Edith; but still there was great uncertainty as to her guilt or innocence. It was generally believed that she had been subject to too much restraint, and in a foolish desire to escape had been induced to marry Dudley. But she had found him a worse master than the other, and had hated him from the first, so that they had many quarrels, in which she had freely threatened his life. Finally both had disappeared on the same night. He was dead; she survived.

The deceased could not have committed suicide, for the head was missing. Had it not been for that missing head, the theory of suicide would have been plausible.

The second day of the trial came. Edith had seen her father on the previous evening, and had learned something from him which

had produced a beneficial effect, for there was less terror and dejection in her face. This was the first time that she had seen him since his illness.

There was one in the hall that day who looked at her with an earnest glance of scrutiny as he took his place among the witnesses.

It was Sir Lionel Dudleigh, who had come here to give what testimony he could about his son. His face was as serene as usual; there was no sadness upon it, such as might have been expected in the aspect of a father so terribly bereaved; but the broad content and placid bonhomie appeared to be invincible.

The proceedings of this day were begun by an announcement on the part of the counsel for the defense, which fell like a thunder-clap upon the court. Sir Lionel started, and all in the court involuntarily stretched forward their heads as though to see better the approach of the astonishing occurrence which had been announced.

The announcement was simply this, that any further proceedings were useless, since the missing man himself had been found, and was to be produced forthwith. There had been no murder, and the body that had been found must be that of some person unknown.

Shortly after a group entered the hall.

First came Frederick Dalton, known to the court as "John Wiggins." He still bore traces of his recent illness, and, indeed, was not fit to be out of his bed, but he had dragged himself here to be present at this momentous scene. He was terribly emaciated, and moved with difficulty, supported by Mrs. Dunbar, who herself showed marks of suffering and exhaustion almost equal to his.

But after these came another, upon whom all eyes were fastened, and even Edith's gaze was drawn away from her father, to whom she had longed to fly so as to sustain his dear form, and fixed upon this new-comer.

Dudleigh! The one whom she had known as Mowbray. Dudleigh!

Yes, there he stood.

Edith's eyes were fixed upon him in speechless amazement.

It was Dudleigh, and yet it seemed as though it could not be Dudleigh.

There was that form and there was that face which had haunted her for so long a time, and had been associated with so many dark and terrible memories—the form and the face which were so hateful, which never were absent from her thoughts, and intruded even upon her dreams.

Yet upon that face there was now something which was not repulsive even to her. It was a noble, spiritual face. Dudleigh's features were remarkable for their faultless outline and symmetry, and now the expres-

sion was in perfect keeping with the beauty of physical form, for the old hardness had departed, and the deep stamp of sensuality and selfishness was gone, and the sinister look which had once marred those features could be traced there no more.

It was thinner than the face which Edith remembered, and it seemed to her as if it had been worn down by some illness. If so, it must have been the same cause which had imparted to those features the refinement and high bearing which were now visible there. There was the same broad brow covered with its clustering locks, the same penetrating eyes, the same square, strong chin, the same firm, resolute mouth, but here it was as though a finer touch had added a subtle grace to all these; for about that mouth there lingered the traces of gentleness and kindness, like the remnant of sweet smiles; the glance of the eye was warmer and more human; there was also an air of melancholy, and over all a grandeur of bearing which spoke of high breeding and conscious dignity.

This man, with his earnest and even melancholy face and lofty bearing, did not seem like one who could have plotted so treacherously against a helpless girl. His aspect filled Edith with something akin to awe, and produced a profound impression upon the spectators. They forgot the hatred which they had begun to feel against Dudleigh in the living presence of the object of their hate, and looked in silence first at Edith, then at the new-comer, wondering why it was that between such as these there could be any thing less than mutual affection. They thought they could understand now why she should choose him as a husband. They could not understand how such a husband could become hateful.

In all the court but one object seemed to attract Dudleigh, and that was Edith. His eyes had wandered about at first, and finally had rested on her. With a glance of profoundest and most gentle sympathy he looked at her, conveying in that one look enough to disarm even her resentment. She understood that look, and felt it, and as she looked at him in return she was filled with wonder.

Could such things be? she thought. Was this the man who had caused her so much suffering, who had blasted and blighted the hopes of her life? or, rather, had the man who had so wronged her been transformed to this? Impossible! As well might a fiend become changed to an archangel. And yet here he was. Evidently this was Dudleigh. She looked at him in speechless bewilderment.

The proceedings of the court went on, and Dudleigh soon explained his disappearance. As he spoke his voice confirmed the fact that he was Dudleigh; but Edith listened to it

with the same feelings which had been excited by his face. It was the same voice, yet not the same; it was the voice of Dudley, but the coldness and the mockery of its intonations were not there. Could he have been playing a devil's part all along, and was he now coming out in his true character, or was this a false part? No; whatever else was false, this was not—that expression of face, that glance of the eye, those intonations, could never be feigned. So Edith thought as she listened.

Dudley's explanation was a simple one. He had not been very happy at Dalton Hall, and had concluded to go away that night for a tour on the Continent. He had left so as to get the early morning train, and had traveled on without stopping until he reached Palermo, from which he had gone to different places in the interior of Sicily, which he mentioned. He had climbed over the gate, because he was in too much of a hurry to wake the porter. He had left his valise, as he intended to walk. He had, of course, left his dog at Dalton, because he couldn't take him to the Continent. He had forgotten his watch, for the reason that he had slept longer than he intended, and dressed and went off in a great hurry. The pocket-book which he left was of no importance—contained principally memoranda, of no use to any but himself. He had no idea there would have been such a row, or he would not have gone in such a hurry. He had heard of this for the first time in Sicily, and would have come at once, but, unfortunately, he had an attack of fever, and could not return before.

Nothing could have been more natural and frank than Dudley's statement. A few questions were asked, merely to satisfy public curiosity. Every one thought that a trip to Sicily was a natural enough thing for one who was on such bad terms with his wife, and the suddenness of his resolution to go there was sufficient to account for the disorder in which he had left his room.

But all this time there was one in that court who looked upon the new-comer with far different feelings than those which any other had.

This was Sir Lionel Dudley.

He had heard the remark of the counsel that Dudley had returned, and looked toward the door as he entered with a smile on his face. As he saw Dudley enter he started. Then his face turned ghastly white, and his jaw fell. He clutched the railing in front of him with both hands, and seemed fascinated by the sight.

Near him stood Mrs. Dunbar, and Dalton leaned on her. Both of these looked fixedly at Sir Lionel, and noticed his emotion.

At the sound of Dudley's voice Sir Lionel's emotion increased. He breathed heavily. His face turned purple. His knuckles turned white as he grasped the railing. Sud-

denly, in the midst of Dudley's remarks, he started to his feet, and seemed about to say something. Immediately in front of him were Dalton and Mrs. Dunbar. At that instant, as he rose, Mrs. Dunbar laid her hand on his arm.

He looked at her with astonishment. He had not seen her before. She fixed her solemn eyes on him—those eyes to which had come a gloom more profound, and a sadness deeper than before. But Sir Lionel stared at her without recognition, and impatiently tried to shake off her hand.

"Who are you?" he said, suddenly, in a trembling voice—for there was something in this woman's face that suggested startling thoughts.

Mrs. Dunbar drew nearer to him, and in a whisper that thrilled through every fibre of Sir Lionel's frame, hissed in his ear,

"I am your wife—and here is my brother Frederick!"

Over Sir Lionel's face there came a flash of horror, sudden, sharp, and overwhelming. He staggered and shrank back.

"Claudine!" he murmured, in a stifled voice.

"Sit down," whispered Lady Dudley—now no longer Mrs. Dunbar—"sit down, or you shall have to change places with Frederick's daughter."

Sir Lionel swayed backward and forward, and appeared not to hear her. And now his eyes wandered to Dalton, who stood gazing solemnly at him, and then to Dudley, who was still speaking.

"Who is that?" he gasped.

"Your son!" said Lady Dudley.

At this instant Dudley finished. Sir Lionel gave a terrible groan, and flung up his arms wildly. The next instant he fell heavily forward, and was caught in the arms of his wife. A crowd flew to his assistance, and he was carried out of court, followed by Lady Dudley.

There was a murmur of universal sympathy.

"Poor Sir Lionel! He has been heart-broken, and the joy of his son's safety is too much."

After this the proceedings soon came to an end.

Edith was free!

Dalton tried to get to her, but in his weakness sank upon a seat, and looked imploringly at his daughter. Seeing this, Dudley sprang to his assistance, and gave his arm. Leaning heavily upon this, Dalton walked toward Edith, who was already striving to reach him, and, with a low cry, caught her in his arms.

Sir Lionel had been taken to the inn, where Lady Dudley waited on him. After some time he recovered his senses, and began to rally rapidly. It had been feared that it was apoplexy, but, fortunately for the

"HE LOOKED AT HER WITH ASTONISHMENT."

sufferer, it turned out to be nothing so serious as that. After this Lady Dudleigh was left alone with her husband.

Ten years of separation lay between these two—a separation undertaken from causes that still existed to alienate them beyond the hope of reconciliation. Yet there was much to be said; and Lady Dudleigh had before her a dark and solemn purpose.

On the next day Sir Lionel was able to drive out. Lady Dudleigh seemed to have constituted herself his guardian. Sir Lionel's face and expression had changed. The easy, careless bonhomie, the placid content, the serene joyousness, that had once characterized him, were gone. In the place of these there came an anxious, watchful, troubled look—the look of a mind ill at ease—the furtive glance, the clouded brow. It was as though in this meeting Lady Dudleigh had communicated to her husband a part of that expression which prevailed in her own face.

Sir Lionel seemed like a prisoner who is attended by an ever-vigilant guard—one who watches all his movements, and from whom he can not escape. As he rolled along

in his carriage, the Black Care of the poet seemed seated beside him in the person of Lady Dudleigh.

While Sir Lionel thus recovered from the sudden shock which he had felt, there was another who had endured a longer and severer course of suffering, and who had rallied for a moment when his presence was required, but only to sink back into a relapse worse than the illness from which he had begun to recover. This was Frederick Dalton, who had crawled from his bed twice—once to his daughter's prison, and once to the scene of her trial. But the exertion was too much, and the agitation of feeling to which he had been subject had overwhelmed him. Leaning heavily on Dudleigh, and also on Edith, he was taken by these two to his carriage, and thence to the inn; but here he could walk no further. It was Dudleigh who had to carry him to his room and lay him on his bed—and Dudleigh, too, who would intrust to no other person the task of putting his prostrate form in that bed. Dudleigh's own father was lying in the same house, but at that moment,

whatever were his motives, Dalton seemed to have stronger claims on his filial duty, and Edith had to wait till this unlooked-for nurse had tenderly placed her father in his bed.

The doctor, who had found Sir Lionel's case so trifling, shook his head seriously over Frederick Dalton. Dudleigh took up his station in that room, and cared for the patient like a son. The day passed, and the night, and the next morning, but Dalton grew no better. It was a strange stupor which affected him, not like paralysis, but arising rather from exhaustion, or some affection of the brain. The doctor called it congestion. He lay in a kind of doze, without sense and without suffering, swallowing any food or medicine that might be offered, but never noticing any thing, and never answering any questions. His eyes were closed at all times, and in that stupor he seemed to be in a state of living death.

Edith's grief was profound; but in the midst of it she could not help feeling wonder at the unexpected part which Dudleigh was performing. Who was he that he should take so large a part in the care of her father? Yet so it was; and Dudleigh seemed to think of nothing and see nothing but that old man's wasted and prostrate form.

For the present, at least, departure from the inn was of course out of the question. Edith's position was a very distressing one. Every feeling of her heart impelled her to be present at her father's bedside, but Dudleigh was present at that same bedside; and how could she associate herself with him even there? At first she would enter the room, and sit quietly by her father's bedside, and on such occasions Dudleigh would respectfully withdraw; but this was unpleasant, and she hardly knew what to do.

Two or three days thus passed, and on the third Dudleigh requested an interview, to ask her, as he said, something about "Mr. Wiggins"—for this was the name by which Mr. Dalton still was called. This request Edith could not refuse.

Dudleigh entered with an air of profound respect.

"Miss Dalton," said he, laying emphasis on that name, "nothing would induce me to intrude upon you but my anxiety about your father. Deep as your affection for him may be, it can hardly be greater than mine. I would gladly lay down my life for him. At the same time, I understand your feelings, and this is what I wish to speak about. I would give up my place at his bedside altogether if you wished it, and you should not be troubled by my presence; but I see that you are not strong enough to be sole nurse, or to undertake the work that would be required of you, and that your own affection for him would impose upon you. You yourself are not strong, and you must take

care of yourself for his sake. I will not, therefore, give up to you all the care of your father, but I will absent myself during the afternoon, and you will then have exclusive care of him."

Edith bowed without a word, and Dudleigh withdrew.

This arrangement was kept up, and Edith scarcely saw Dudleigh at all. She knew, however, that his care for her father was incessant and uninterrupted. Every thing that could possibly be needed was supplied; every luxury or delicacy that could be thought of was obtained; and not only were London physicians constantly coming up, but from the notes which lay around, she judged that Dudleigh kept up a constant correspondence with them about this case.

CHAPTER XLIII.

SIR LIONEL AND HIS "KEEPER."

SIR LIONEL, who had come to this place with the face that indicated a mind at peace, thus found himself suddenly confronted by a grim phantom, the aspect of which struck terror to his heart. That phantom was drawn up from a past which he usually did not care to remember. Now, however, he could not forget it. There was one by his side to remind him of it always—one who had become his guard, his jailer—in fact, his keeper—a word which signifies better than any other the attitude which was assumed by Lady Dudleigh. For the feeling which Sir Lionel had toward her was precisely like that which the lunatic has toward his keeper, the feeling that this one is watching night and day, and never relaxes the terrible stare of those vigilant eyes. There are those who on being thus watched would grow mad; and Sir Lionel had this in addition to his other terrors—this climax of them all, that upon him there was always the maddening glare of his "keeper's" eyes. Terrible eyes were they to him, most terrible—eyes which he dared not encounter. They were the eyes of his wife—a woman most injured; and her gaze reminded him always of a past full of horror. That gaze he could not encounter. He knew without looking at it what it meant. He felt it on him. There were times when it made his flesh crawl, nor could he venture to face it.

A few days of this reduced him to a state of abject misery. He began to fear that he was really growing mad. In that case he would be a fit subject for a "keeper." He longed with unutterable longing to throw off this terrible restraint; but he could not and dared not. That woman, that "keeper," wielded over him a power which he knew and felt, and dared not defy. It was the power that arises from the knowledge

of secrets of life and death, and her knowledge placed his life in her hands.

This woman was inflexible and inexorable. She had suffered so much that she had no pity for his present sufferings. These seemed trivial to her. She showed a grand, strong, self-sufficient nature, which made her his superior, and put her above the reach of any influences that he might bring. He could remember the time when she was a fair and gentle young girl, with her will all subject to his; then a loving bride with no thought apart from him; but now years of suffering and self-discipline had transformed her to this, and she came back to him an inexorable Fate, an avenging Nemesis.

Yet Sir Lionel did not give up all hope. He could not drive her away. He could not fly away from her, for her watch was too vigilant; but he hoped for some chance of secret flight in which, if he once escaped, he might find his way to the Continent. With something of that cunning which characterizes the insane, and which, perhaps, is born of the presence of a "keeper," Sir Lionel watched his opportunity, and one day nearly succeeded in effecting his desire.

That day Lady Dudleigh was in her brother's room. Sir Lionel had waited for this, and had made his preparations. When she had been gone for a few minutes, he stole softly out of his room, passed stealthily down the back stairs of the inn, and going out of the back-door, reached the rear of the house. Here there was a yard, and a gate that led out to a road at the end of the house. A carriage had been in waiting here for about an hour. Sir Lionel hurried across the yard, passed through the gate, and looked for the carriage.

He took one glance, and then a deep oath escaped him.

In the carriage was Lady Dudleigh.

How she could have detected his flight he could not imagine, nor did he now care. She had detected it, and had followed at once to circumvent him. She must have gone down the front stairs, out of the front-door, and reached the carriage before him. And there she was! Those hateful eyes were fixed on him—he felt the horrid stare—he cowered beneath it. He walked toward her.

"I thought I would go out too," said she.

Sir Lionel said not a word. He felt too much ashamed to turn back now, and was too politic to allow her to see any open signs that he was in full flight; so he quietly got into the carriage, and took his seat by her side.

Whipping up the horses, he drove them at a headlong rate of speed out through the streets into the country. His whole soul was full of mad fury. Rage and disappointment together excited his brain to madness; and the fierce rush of the impetuous steeds was in accordance with the excitement of

his mind. At length the horses themselves grew fatigued, and slackened their pace. Sir Lionel still tried to urge them forward, but in vain, and at last he flung down the whip with a curse.

"I'll not stand this any longer!" he cried, vehemently, addressing his "keeper," but not looking at her.

"What?" said she.

"This style of being dogged and tracked and watched."

"You allude to me, I suppose," said Lady Dudleigh. "At any rate, you must allow that it is better to be tracked, as you call it, by me, than by the officers of the law."

"I don't care," growled Sir Lionel, gathering courage. "I'll not stand this style of thing any longer. I'll not let them have it all their own way."

"I don't see what you can do," said Lady Dudleigh, quietly.

"Do!" cried Sir Lionel, in a still more violent tone—"do! I'll tell you what I'll do. I'll fight it out."

"Fight!"

"Yes," cried Sir Lionel, with an oath. "Every one of you—every one. Every one without a single exception. Oh, you needn't think that I'm afraid. I've thought it all over. You're all under my power. Yes—ha, ha, ha! that's it. I've said it, and I say what I mean. You thought that I was under your power. Your power! Ha, ha, ha! That's good. Why, you're all under mine—every one of you."

Sir Lionel spoke wildly and vehemently, in that tone of feverish excitement which marks a madman. It may have been the influence of his "keeper," or it may have been the dawns of actual insanity.

As for Lady Dudleigh, she did not lose one particle of her cold-bloodedness. She simply said, in the same tone,

"How?"

"How? Ha, ha! Do you think I'm going to tell you? That's my secret. But stop. Yes; I don't care. I'd just as soon tell as not. You can't escape, not one of you, unless you all fly at once to the Continent, or to America, or, better yet, back to Botany Bay. There you'll be safe. Fly! fly! fly! or else," he suddenly added, in a gloomy tone, "you'll all die on the gallows! every one of you, on the gallows! Ha, ha, ha! swinging on the gallows! the beautiful gallows!"

Lady Dudleigh disregarded the wildness of his tone, or perhaps she chose to take advantage of it, thinking that in his excitement he might disclose his thoughts the more unguardedly.

"You can do nothing," she said.

"Can't I, though?" retorted Sir Lionel. "You wait. First, there's Dalton."

"What can you do with him?"

"Arrest him," said Sir Lionel. "What is

he! An outlaw! An escaped convict! He lives under an assumed name. He must go back to Botany Bay—that is, if he isn't hanged. And then there's that pale-faced devil of a daughter with her terrible eyes." He paused.

"What can you do to her?"

"Her! Arrest her too," cried Sir Lionel. "She murdered my boy—my son—my Leon. She must be hanged. You shall not save her by this trick. No! she must be hanged, like her cursed father."

A shudder passed through Lady Dudleigh.

Sir Lionel did not notice it. He was too much taken up with his own vengeful thoughts.

"Yes," said he, "and there's that scoundrel Reginald."

"Reginald!" cried Lady Dudleigh, in a stern voice. "Why do you mention him?"

"Oh, he's one of the same gang," cried Sir Lionel. "He's playing their game. He is siding against his father, as he always did, and with his brother's murderers. He shall not escape. I will avenge Leon's death on all of you; and as for him, he shall suffer!"

It was with a strong effort that Lady Dudleigh restrained herself. But she succeeded in doing so, and said, simply, as before,

"How?"

"Arrest him!" cried Sir Lionel. "Arrest him too. He is guilty of perjury; and if he doesn't hang for it, he'll go back again to Botany Bay with that scoundrel with whom he sides against me—his own father—and against his brother."

"Are there any more?" asked Lady Dudleigh, as Sir Lionel ended.

"More! Yes," he said.

"Who?"

"You!" shouted Sir Lionel, with a voice of indescribable hate and ferocity. He turned as he spoke, and stared at her. His wild eyes, however, met the calm, cold, steady glance of those of his "keeper," and they fell before it. He seized the whip and began to lash the horses, crying as he did so, "You! yes, you! you! most of all!"

"What can you do to me?" asked Lady Dudleigh.

"You? Arrest you."

"What have I done?"

"You? You have done every thing. You have aided and abetted the escape of an outlaw. You have assisted him in his nefarious occupation of Dalton Hall. You have aided and abetted him in the imprisonment of Dalton's brat. You have aided and abetted him in the murder of my boy Leon. You have—"

"Stop!" cried Lady Dudleigh, in a stern, commanding voice. "You have been a villain always, but you have never been so outspoken. Who are you? Do you know what happened ten years ago?"

"What?" asked Sir Lionel. "Do you mean Dalton's forgery, and his assassination of that—that banker fellow?"

Lady Dudleigh smiled grimly.

"I am glad that you said that," said she.

"You remove my last scruple. My brother's wrongs have well-nigh maddened me; but I have hesitated to bear witness against my husband, and the father of my children. I shall remember this, and it will sustain me when I bear my witness against you in a court of law."

"Me?" said Sir Lionel. "Me? Witness against me? You can not. No one will believe you."

"It will not be only your wife," said she, "though that will be something, but your own self, with your own hand."

"What do you mean?"

"I mean what you know very well—your letter which you wrote to Frederick, inclosing your forged check."

"I never forged a check, and I never wrote a letter inclosing one!" cried Sir Lionel. "Dalton forged that letter himself, if there is such a letter. He was an accomplished forger, and has suffered for it."

"The letter is your own," said Lady Dudleigh, "and I can swear to it."

"No one will believe you," cried Sir Lionel. "You shall be arrested for perjury."

Lady Dudleigh gave another grim smile, and then she added, "There is that *Maltese cross*. You forget that."

"What *Maltese cross*?" said Sir Lionel. "I never had one. That wasn't mine; it was Dalton's."

"But I can swear in a court of law," said Lady Dudleigh, "that this *Maltese cross* was yours, and that it was given to you by me as a birthday gift."

"No one will believe you!" cried Sir Lionel; "no one will believe you!"

"Why not? Will they refuse the oath of Lady Dudleigh?"

"I can show them that you are insane," said Sir Lionel, with a chuckle at the idea, which seemed to him like a sudden inspiration.

"You will not be able to show that Reginald is insane," said she.

"Reginald?"

"Yes, Reginald," repeated Lady Dudleigh.

"Reginald knows that *Maltese cross*, and knows when I gave it to you. He too will be ready to swear to that in a court of law whenever I tell him that he may do so."

"Reginald?" said Sir Lionel, in a gloomy voice. "Why, he was—a child then."

"He was sixteen years old," said Lady Dudleigh.

This mention of Reginald seemed to crush Sir Lionel. He was silent for a long time. Evidently he had not been prepared for this in his plans for what he called a "fight." He sat in moody silence therefore. Once or

twice he stole a furtive glance at her, and threw upon her a look which she did not see. It was a look full of hate and malignancy, while at the same time there was an expression of satisfaction in his face, as though he had conceived some new plan, which he intended to keep a secret all to himself.

CHAPTER XLIV.

LADY DUDLEIGH'S DECISION.

DURING the remainder of that drive nothing was said by either. Sir Lionel had his own thoughts, which, whatever they were, appeared to give him a certain satisfaction, and his brow was more unclouded when they reached the inn than it had been ever since the day of the trial. Evidently the new design which he had conceived, and which remained unuttered in his mind, was very satisfactory to him.

That evening he himself began the conversation with Lady Dudley, a thing which he had not before done.

"It's all very well," said he, "for you to carry on your own plans. You may carry them on and welcome. I won't prevent you; in fact, I can't. It's no use to deny it; I'm in your power. You're determined to crush me, and I must be crushed, I suppose. You are going to show to the world the strange spectacle of a wife and a son rising up against a husband and father, and swearing his life away. You will lead on, and Reginald will follow. This is the education that you have given him—it is to end in parricide. Very well; I must submit. Wife, slay your husband! mother, lead your son to parricide! Of course you comfort your conscience with the plea that you are doing justice. In the French Revolution there were wives who denounced their husbands, and sons who denounced their fathers, in the name of 'humanity,' and for the good of the republic. So go on. See that justice be done. Come on yourself to assassinate your husband, and bring on your parricide! Take sides with those who have murdered your son—the son whom you bore to me, and once loved! Unsex yourself, and become a Fury! It is useless for me to make resistance, I suppose; and yet, woman! wife! mother! let me tell you that on the day when you attempt to do these things, and when your son stands by your side to help you, there will go up a cry of horror against you from outraged humanity!"

At this Lady Dudley looked at him, who, as usual, averted his eyes; but she made no reply.

"Bring him on!" said Sir Lionel—"your son—my son—the parricide! Do your worst. But at the same time allow me to inform you, in the mildest manner in the

world, that if I am doomed, there is no reason why I should go mad in this infernal hole. What is more, I do not intend to stay here one single day longer. I'm not going to run away. That is impossible; you keep too sharp a look-out altogether. I'm simply going away from this place of horrors, and I rather think I'll go home. I'll go home—yes, home. Home is the place for me—Dudleigh Manor, where I first took you, my true wife—that is the place for me to be in when you come to me, you and your son, to hand me over, Judas-like, to death. Yes, I'm going home, and if you choose to accompany me, why, all that I can say is, I'll have to bear it."

"I'll go," said Lady Dudley, laconically.

"Oh, of course," said Sir Lionel, "quite a true wife; like Ruth and Naomi. Whither thou goest, I will go. You see, I'm up in my Bible. Well, as I said, I can not prevent you, and I suppose there is no need for me to tell you to get ready."

Whether under these bitter taunts Lady Dudley writhed or not did not at all appear. She seemed as cool and calm as ever. Perhaps she had so schooled her nature that she was able to repress all outward signs of emotion, or perhaps she had undergone so much that a taunt could have no sting for her, or perhaps she had already contemplated and familiarized herself with all these possible views of her conduct to such an extent that the mention of them created no emotion. At any rate, whatever she felt, Sir Lionel saw nothing.

Having discharged this shot, Sir Lionel went to his desk, and taking out writing materials, began to write a letter. He wrote rapidly, and once or twice glanced furtively at Lady Dudley, as though he was fearful that she might overlook his writing. But there was no danger of that. Lady Dudley did not move from her place. She did not seem to be aware that he was writing at all.

At length Sir Lionel finished, and then he folded, sealed, and addressed the letter. He finished this task with a face of supreme satisfaction, and stole a look toward Lady Dudley, in which there was a certain cunning triumph very visible, though it was not seen by the one at whom it was directed.

"And now," said he, waving the letter somewhat ostentatiously, and speaking in a formal tone, in which there was an evident sneer—"and now, Lady Dudley, I have the honor to inform you that I intend to go out and post this letter. May I have the honor of your company as far as the post-office, and back?"

Lady Dudley rose in silence, and hastily throwing on her things, prepared to follow him. Sir Lionel waited with mocking politeness, opened the door for her to pass out first, and then in company with her went to

the post-office, where he mailed the letter, and returned with the smile of satisfaction still upon his face.

Early on the next morning Lady Dudley saw her son. He had watched all that night by Dalton's bedside, and seemed pale and exhausted.

"Reginald," said Lady Dudley, "Sir Lionel is going away."

"Going away?" repeated Reginald, absently.

"Yes; back to Dudley Manor."

Reginald looked inquiringly at his mother, but said nothing.

"I intend," said Lady Dudley, "to go with him."

"You?"

"Yes."

Reginald looked at her mournfully.

"Have you done any thing with him yet?" he asked.

Lady Dudley shook her head.

"Do you expect to do any thing?"

"I do."

"I'm afraid you will be disappointed."

"I hope not. I have at least gained a hold upon him, and I have certainly worked upon his fears. If I remain with him now I hope in time to extort from him that confession which will save us all from an additional sorrow; one perhaps as terrible as any we have ever known, if not even more so."

"Confession!" repeated Reginald. "How is that possible? He will never confess—never. If he has remained silent so long, and has not been moved by the thought of all that he has done, what possible thing can move him? Nothing but the actual presence of the law. Nothing but force."

"Well," said Lady Dudley, "it is worth trying—the other alternative is too terrible just yet. I hope to work upon his fears. I hope to persuade him to confess, and fly from the country to some place of safety. Frederick must be righted at all hazards, and I hope to show this so plainly to Sir Lionel that he will acquiesce in my proposal, confess all, save Frederick, and then fly to some place where he may be safe. If not, why, then we can try the last resort. But oh, Reginald, do you not see how terrible that last resort is?—I against my husband, you against your father—both of us bringing him to the gallows! It is only the intolerable sense of Frederick's long-sufferings that can make me think of doing so terrible a thing. But Frederick is even now in danger. He must be saved; and the question is between the innocent and the guilty. I am strong enough to decide differently from what I did ten years ago."

"Oh, I know—I feel it all, mother dear," said Reginald; "but at the same time I don't like the idea of your going away with him—alone."

"Why not?"

"I don't like the idea of your putting yourself in his power."

"His power?"

"Yes, in Dudley Manor, or any other place. He is desperate. He will not shrink from any thing that he thinks may save him from this danger. You will be his chief danger: he may think of getting rid of it. He is unscrupulous, and would stop at nothing."

"Oh, as for that, he may be desperate, but what can he possibly do? Dudley Manor is in the world. It is not in some remote place where the master is superior to law. He can do no more harm there than he can here."

"The man," said Reginald, "who for all these years has outraged honor and justice and truth, and has stifled his own conscience for the sake of his comfort, must by this time be familiar with desperate deeds, and be capable of any crime. I am afraid, mother dear, for you to trust yourself with him."

"Reginald," said Lady Dudley, "you speak as though I were a child or a school-girl. Does he seem now as though he could harm me, or do I seem to be one who can easily be put down? Would you be afraid to go with him?"

"I—afraid? That is the very thing that I wish to propose."

"But you could not possibly have that influence over him which I have. You might threaten, easily enough, and come to an open rupture, but that is what I wish to avoid. I wish to bring him to a confession, not so much by direct threats as by various constraining moral influences."

"Oh, as to that," said Reginald, "I have no doubt that you will do far better than I can; but at the same time I can not get rid of a fear about your safety."

"And do you really think, Reginald, that I would be less safe than you? or, from what you know of me, should you suppose that I have much of that woman's weakness about me which might make me an easy prey to one who wished to do me harm?"

"I know well what you are, mother dear," said Reginald, taking her hand tenderly in both of his. "You have the tenderness of a woman and the courage of a man; but still I feel uneasy. At any rate, promise me one thing. You will let me know what you are doing."

"I do not promise to write regularly," said Lady Dudley, "but I do promise to write the moment that any thing happens worth writing about."

"And if you are ill, or in danger?" said Reginald, anxiously.

"Oh, then, of course I shall write at once. But now I must go. I shall not see you again for some time. Good-by."

Lady Dudley kissed her son tenderly as she said this, and left him, and Reginald re-

turned to his place by Frederick Dalton's bedside.

That same day, shortly after this interview, Sir Lionel and Lady Dudleigh drove away from the inn, *en route* for Dudleigh Manor.

CHAPTER XLV.

LADY DUDLEIGH IS SHOWN TO HER ROOM.

AFTER driving for about a mile Sir Lionel and Lady Dudleigh took the train, securing a compartment to themselves.

During this part of the journey Sir Lionel's face lost much of that gloom which of late had pervaded it, and assumed an expression which was less dismal, though not quite like the old one. The old look was one of serene and placid content, an air of animal comfort, and of easy-going self-indulgence; but now the expression was more restless and excited. There was a certain knowing look—a leer of triumphant cunning—combined with a tendency to chuckle over some secret purpose which no one else knew. Together with this there was incessant restlessness; he appeared perpetually on the look-out, as though dreading discovery; and he alternated between exultant nods of his head, with knowing winks at vacancy, and sudden sharp furtive glances at his companion. Changed as Sir Lionel's mood was, it can hardly be said that the change was for the better. It would have been obvious even to a more superficial observer than that vigilant "keeper" who accompanied him that Sir Lionel had lost his self-poise, and was in rather a dangerous way. Lady Dudleigh must have noticed this; but it made no difference in her, save that there was perhaps a stonier lustre in her eyes as she turned them upon him, and a sharper vigilance in her attitude.

In this way they rode on for several hours; and whatever Sir Lionel's plans might have been, they certainly did not involve any action during the journey. Had he been sufficiently violent he might have made an assault upon his companion in the seclusion of that compartment, and effectually prevented any trouble ever arising to him from her. He might have done this, and made good his escape in the confusion of some station. But no such attempt was made; and so in due time they reached the place where they were to get out.

"This is the nearest station to Dudleigh Manor," said Sir Lionel, gayly. "This road has been made since your time."

Lady Dudleigh said nothing, but looked around. She saw nothing that was familiar. A neat wayside station, with the usual platform, was nearest; and beyond this arose trees which concealed the view on one side, while on the other there were fields and

hedges, and one or two houses in the distance. It was a commonplace scene, in a level sort of country, and Lady Dudleigh, after one short survey, thought no more about it. It was just like any other wayside station.

A common-looking hack, with a rather ill-dressed driver, was waiting, and toward this Sir Lionel walked.

"This," said he, "is the Dudleigh coach. It isn't so grand an affair as it used to be; but my means have dwindled a good deal since your day, you know, and I have to economize—yes—ha, ha, ha!—economize—queer thing too, isn't it? Economizing—ha, ha, ha!"

Sir Lionel's somewhat flighty manner was not at all congenial to Lady Dudleigh, and she treated him as the vigilant "keeper" always treats his flighty prisoner—that is, with silent patience and persistent watchfulness.

In a few minutes they were both seated inside the coach, and were driving away. The coach was a gloomy one, with windows only in the doors. The rest was solid woodwork. These windows in the doors were small, and when let down were scarcely large enough for one to put his head through. When sitting down it was impossible for Lady Dudleigh to see the road. She could see nothing but the tops of the trees, between which the sky appeared occasionally. She saw that she was driving along a road which was shaded with trees on both sides; but more than this she could not see.

They drove for about an hour at a moderate pace, and during this time Sir Lionel preserved that same peculiar demeanor which has already been described, while Lady Dudleigh maintained her usual silent watchfulness.

At length they stopped for a moment. Voices sounded outside, and then Lady Dudleigh saw that she was passing through a gateway. Thinking that this was Dudleigh Manor, she made no remark, but calmly awaited the time when she should reach the house. She did not have to wait long. Sooner than she expected the coach stopped. The driver got down and opened the door. Sir Lionel sprang out with surprising agility, and held out his hand politely to assist his companion. She did not accept his offer, but stepped out without assistance, and looked around.

To her surprise, the place was not Dudleigh Manor at all, but one which was entirely different, and quite unfamiliar. It was a brick house of no very great size, though larger than most private houses, of plain exterior, and with the air of a public building of some sort. The grounds about were stiff and formal and forbidding. The door was open, and one or two men were standing there. It did not look like an inn,

and yet it certainly was not a private residence.

"I have to stop here for a little while," said Sir Lionel, "to see a friend on business. We are not half-way to Dudleigh Manor yet; it's further than you think."

He turned and went up the steps. Lady Dudleigh looked around once more, and then followed him. The men at the head of the steps looked at her curiously as she went in. She took no notice of them, however, but walked past them, looking calmly beyond them.

On entering the house she saw a bare hall covered with slate-colored oil-cloth, and with a table against the wall. A gray-headed man came out of one of the rooms, and advanced to meet Sir Lionel, who shook hands with him very cordially, and whispered to him a few words. The gray-headed man wore spectacles, was clean shaven, with a double chin, and a somewhat sleek and oily exterior.

"Lady Dudleigh," said Sir Lionel, leading the gray-headed man forward by the arm, "allow me to make you acquainted with my particular friend, Dr. Leonard Morton."

Lady Dudleigh bowed slightly, and Dr. Morton made a profound obeisance that seemed like a caricature of politeness.

"Will you have the kindness to walk up stairs?" said he, and led the way, while the others followed him. Ascending the stairs, they reached a large room at the back of the house, which was furnished in the same stiff and formal way as the hall below. Over the mantel-piece hung an engraving, somewhat faded out, and on the table were a Bible and a pitcher of water.

The doctor politely handed Lady Dudleigh a chair, and made one or two remarks about the weather.

"Sir Lionel," said he, "if Lady Dudleigh will excuse us for a few moments, I should like to speak with you in private."

"Will you have the kindness, Lady Dudleigh," asked Sir Lionel, "to excuse us for a few moments? We shall not leave you long alone. And here is a book—an invaluable book—with which you may occupy your time."

He said this with such exaggerated politeness, and with such a cunning leer in his eyes, that his tone and manner were most grotesque; and as he concluded he took up the large Bible with ridiculous solemnity.

Lady Dudleigh merely bowed in silence.

"A thousand thanks," said Sir Lionel, turning away; and thereupon he left the room, followed by the doctor. Lady Dudleigh heard their footsteps descending the stairs, and then they seemed to go into some room.

For some time she forgot all about him. The place had at first surprised her, but she gave it little thought. She had too much

to think of. She had before her a task which seemed almost impossible; and if she failed in this, there was before her that dread alternative which Sir Lionel had presented to her so plainly. Other things too there were besides her husband—connected with all who were dearest to her—her brother, perhaps, dying before he had accomplished his work; her son so mysteriously murdered; her other son awaiting her command to assist in bringing his father to death. Besides, there was the danger that even now might be impending over these—the danger of discovery. Sir Lionel's desperate threats might have some meaning, and who could tell how it might result if he sought to carry out those threats?

Brooding over such thoughts as these, she forgot about the lapse of time, and at last was roused to herself by the entrance of a woman. She was large and coarse and fat. At the door stood another woman.

"Your room's ready, missus," said the woman, bluntly.

Lady Dudleigh rose.

"I don't want a room," said she. "I intend to go in a few minutes."

"Anyway, ye'd better come to your room now, and not keep us waitin'," said the woman.

"You needn't wait," said Lady Dudleigh.

"Come along," said the woman, impatiently. "It's no use stayin' here all day."

Lady Dudleigh felt annoyed at this insolence, and began to think that Sir Lionel had run away while she had forgotten about him. She said nothing to the women, but walked toward the door. The two stood there in the way.

"I will go down," said she, haughtily, "and wait below. Go and tell Sir Lionel."

The women stared at one another.

"Sir Lionel Dudleigh," said Lady Dudleigh, "is with Dr. Morton on business. Tell him that I am tired of waiting, or take me to the room where he is."

"Oh yes, 'm," said one of the women; and saying this, she went down stairs.

In a few moments Dr. Morton came up, followed by the women. The two men who had been standing at the door came into the hall, and stood there at the foot of the stairs.

"Where is Sir Lionel?" was Lady Dudleigh's first words.

The doctor smiled blandly.

"Well, he has just gone, you know; but he'll soon be back—oh yes, quite soon. You wait here, and you may go to your room."

He spoke in an odd, coaxing tone, as though he were addressing some fretful child whom it was desirable to humor.

"Gone!" exclaimed Lady Dudleigh.

"Yes, but he'll soon be back. You needn't wait long. And these women will take you to your own room. You'll find it very pleasant."

"SHE WAS DRAGGED ALONG HELPLESSLY."

"I have no room here," said Lady Dudleigh, haughtily. "If Sir Lionel has gone, I shall go too;" and with these words she tried to move past the woman who was in front of her. But the woman would not move, and the other woman and the doctor stood there looking at her. All at once the truth dawned upon her, or a part of the truth. She had been brought here, and they would keep her here. Who they were she could not imagine, but their faces were not at all prepossessing.

"Oh, it's all right," said the doctor, in a smooth voice. "You shall go to-morrow. We'll send for Sir Lionel."

"Dr. Morton," said Lady Dudleigh, solemnly, "beware how you detain me. Let me go, or you shall repent it. I don't know what your motive is, but it will be a dangerous thing for you. I am Lady Dudleigh, and if you dare to interfere with my movements you shall suffer."

"Oh yes, oh yes," said the doctor. "You are Lady Dudleigh. Oh, of course. And now come, Lady Dudleigh; you shall be treated just like a lady, and have a nice room, and—"

"What do you mean?" cried Lady Dudleigh, indignantly. "This insolence is insufferable."

"Oh yes," said the doctor; "it'll be all right, you know. Come, now; go like a good lady to your room."

"Are you mad?" exclaimed Lady Dudleigh, in amazement.

The doctor smiled and nodded.

"What do you intend to do?" asked Lady Dudleigh, restraining herself with a strong effort.

"Oh, nothing; we shall put you in a nice room, you know—all so pleasant—for you are not very well; and so, Susan, you just take the lady's hand, and, Martha, you take the other, and we'll show her the way to her room."

At this each of the women seized one of Lady Dudleigh's hands quickly and dextrously, the result of long practice, and then they drew her out of the room. Lady Dudleigh resisted, but her strength was useless. She was dragged along helplessly, while all the time the doctor walked after her, prattling in his usual way about "the nice room," and how "comfortable" she would find it. At length they reached a room, and she was taken in. One of the women entered with her. Lady Dudleigh looked around, and saw that the walls were bare and white-washed; the floor was uncarpeted; an iron bedstead and some simple furniture were around her, and a small grated window gave light.

It looked dreary enough, and sufficiently prison-like to appall any one who might be thus suddenly thrust in there. Lady Dudleigh sank into a chair exhausted, and the woman began to make her bed.

"My good woman," said Lady Dudleigh, anxious to get some clew to her position, "can you tell me what all this means?"

"Sure it's all for the good of your health," said the woman.

"But I'm not ill."

"No, not to say ill; but the body's often all right when the mind's all wrong."

"The mind? There's nothing the matter with my mind. Dr. Morton has been deceived. He would not dare to do this if he knew it."

"Sure, now, it's nothing at all, and ye'll be well soon."

At these simple words of the woman Lady Dudleigh began to understand the situation. This must be a lunatic asylum, a private one. Sir Lionel had brought her here, and told the doctor that she was insane. The doctor had accepted his statement, and had received her as such. This at once accounted for his peculiar mode of addressing her.

"There's a mistake," said Lady Dudleigh, quietly. "Dr. Morton has been deceived. Let me see him at once, please, and I will explain. He does not know what a wrong he is doing. My good woman, I am no more mad than you are."

"Dear, dear!" said the woman, going on placidly with her work; "that's the way they all talk. There's not one of them that believes they're mad."

"But I'm not mad at all," said Lady Dudleigh, indignant at the woman's obtuseness.

"There, there; don't you go for to excite yourself," said the woman, soothingly. "But I s'pose you can't help it."

"So this is a mad-house, is it?" said Lady Dudleigh, gloomily, after a pause.

"Well, 'm, we don't call it that; we call it a 'sylum. It's Dr. Morton's 'sylum."

"Now see here," said Lady Dudleigh, making a fresh effort, and trying to be as cool as possible, "I am Lady Dudleigh. I have been brought here by a trick. Dr. Morton is deceived. He is committing a crime in detaining me. I am not mad. Look at me. Judge for yourself. Look at me, and say, do I look like a madwoman?"

The woman, thus appealed to, good-naturedly acquiesced, and looked at Lady Dudleigh.

"Deed," she remarked, "ye look as though ye've had a deal of sufferin' afore ye came here, an' I don't wonder yer mind give way."

"Do I look like a madwoman?" repeated Lady Dudleigh, with a sense of intolerable irritation at this woman's stupidity.

"Deed, then, an' I'm no judge. It's the doctor that decides."

"But what do you say? Come, now."

"Well, then, ye don't look very bad, exceptin' the glare an' glitter of the eyes of ye, an' yer fancies."

"Fancies? What fancies?"

"Why, yer fancies that ye're Lady Dudleigh, an' all that about Sir Lionel."

Lady Dudleigh started to her feet.

"What!" she exclaimed. "Why, I am Lady Dudleigh."

"There, there!" said the woman, soothingly; "sure I forgot myself. Sure ye are Lady Dudleigh, or any body else ye like. It's a dreadful inveiglin' way ye have to trap a body the way ye do."

At this Lady Dudleigh was in despair. No further words were of any avail. The woman was determined to humor her, and assented to every thing she said. This treatment was so intolerable that Lady Dudleigh was afraid to say any thing for fear that she would show the excitement of her feelings, and such an exhibition would of course have been considered as a fresh proof of her madness.

The woman at length completed her task, and retired.

Lady Dudleigh was left alone. She knew it all now. She remembered the letter which Sir Lionel had written. In that he had no doubt arranged this plan with Dr. Morton, and the coach had been ready at the station. But in what part of the country this place was she had no idea, nor could she know whether Dr. Morton was deceived by Sir Lionel, or was his paid employé in this work of villainy. His face did not give her any encouragement to hope for either honesty or mercy from him.

It was an appalling situation, and she knew it. All the horrors that she had ever heard of in connection with private asylums occurred to her mind, and deepened the terror that surrounded her. All the other cares of her life—the sorrow of bereavement, the anxiety for the sick, the plans for Frederick Dalton—all these and many others now oppressed her till her brain sank under the crushing weight. A groan of anguish burst from her.

"Sir Lionel's mockery will become a reality," she thought. "I shall go mad!"

Meanwhile Sir Lionel had gone away. Leaving Lady Dudleigh in the room, he had gone down stairs, and after a few hurried words with the doctor, he left the house and entered the coach, which drove back to the station.

All the way he was in the utmost glee, rubbing his hands, slapping his thighs, chuckling to himself, laughing and cheering.

"Ha, ha, ha! ha, ha, ha!" he laughed. "Outwitted! The keeper—the keeper caught! Ha, ha, ha! Why, she'll never get out—never! In for life, Lionel, my boy! Mad? Why, by this time she's a raving maniac! Ha, ha, ha! She swear against me! Who'd believe a madwoman, an idiot, a lunatic, a bedlamite, a maniac—a howling, frenzied, gibbering, ranting, raving, driveling, maundering, mooning maniac! And now for the boy next—the parricide! Ha, ha, ha! Arrest him! No. Shut him up here—both—with my friend Morton—both

of them, mother and son, the two—ha, ha, ha!—witnesses! One maniac! two maniacs! and then I shall go mad with joy, and come here to live, and there shall be *three maniacs!* Ha, ha, ha! ha, ha, ha-a-a-a-a-a!"

Sir Lionel himself seemed mad now.

On leaving the coach, however, he became calmer, and taking the first train that came up, resumed his journey.

JOSEPH RODMAN DRAKE.

JOSEPH RODMAN DRAKE.

JOSEPH RODMAN DRAKE, the author of *The Culprit Fay* and the hitherto unpublished poems appended to this paper, was born in the city of New York August 7, 1795, the year that gave birth to the eccentric poet Percival, and the accomplished author of *Swallow Barn* and *Horseshoe Robinson*. His ancestors were among the earliest of the Pilgrim Fathers—not a bad genealogy for the American who celebrated in patriotic song the glory of the starry "flag of the free." John Drake, of Devonshire, a kinsman of the redoubtable rover of the seas, Sir Francis, a member of the Council of Plymouth, and one of the original company established by Queen Elizabeth's successor to the English crown for settling New England, came to Boston in the summer of 1630, accompanied by several sons, and soon after settled at East Chester, in the State of New York, where the family acquired a large estate, bounded on one side by the beautiful Bronx, whose attractions were described by their gifted descendant. Jonathan Drake, the poet's father, and a lineal descendant of the member of the Plymouth company, was a colonel in the Revolutionary army, who, after the war, married Miss Hannah Laurence, the daughter of Effingham Laurence,

of Flushing, a highly respectable Long Island family, with as ancient an American ancestry as the Drakes.

The poet was an only son, one of four children, who, early bereaved of their parents, were subjected to many of the pains and privations incident to poverty and the loss of their natural protectors. It was after their death that he wrote, at the early age of fifteen:

"Home! sacred name, at thy endearing sound
What forms of ravished pleasures hover round!
What long-lost blisses, mourned, alas! in vain,
Awakened memory gives my soul again!
Joys mine no more, yet sweeter, dearer still
Than all that wait me in this world of ill.
Thou gnawing canker in misfortune's breast,
Is this thy beam to soothe a wretch to rest?
No, 'tis the light that glimmers on a tomb,
To add a deeper horror to the gloom.
Sad is the homeless heart: and mine hath known
Neglect's cold blasts unpitied and alone;
I meet no eye that, softening, rests on mine,
No hand whose heart-warm pressure says 'Tis
thine!"

No lip whose smile a ready welcome bears,
No heart to share my joys and soothe my cares."

Drake was by nature and birth a gentleman, noble, generous, and ambitious, and possessed with an implicit confidence from childhood that by patient perseverance he could surmount every obstacle, and replace his family in the position to which it was entitled. Like his sisters Caroline and Louise, he was a poet from childhood. The few anecdotes of his early years which have been preserved in the memories of surviving contemporaries include an incident which occurred when he was seven years of age. Having been punished for some childish offense, and imprisoned in a portion of the garret shut off by wooden bars, which had originally inclosed the place as a wine closet, his eldest sister stole up stairs to observe how he bore his punishment, and found Joe pacing the apartment with something like a sword on his shoulder, watching an incongruous heap on the floor, in the character of Don Quixote at his vigils over the armor in the church. At the same early age his ideas gleaned from books sought living shapes before him in the world. A hard-drinking squire who resided near the house of a relative was dubbed "Tam O'Shanter," while a small boy of his acquaintance, named Oscar, was entitled "Little Fingal." His straitened circumstances did not prevent the precocious boy from picking up a tolerable English education, some little knowledge of Latin and French, and a vast amount of general information. He possessed a remarkably retentive memory, that held fast like hooks of steel, and he was then and always a great reader, resembling the hero of *Waverley* in "driving through the sea of books like a vessel without pilot or rudder."

At the age of five Drake composed highly admired conundrums, and at ten wrote some

promising juvenile poems—"the flight of a noble bird for the first time essaying his own wings"—spring-time memorials of genius.

At fourteen Drake wrote *The Mocking-Bird*, and *The Past and the Present*, a portion of which furnished the concluding passage of *Leon* in the published volume of his poems. Four years later he abandoned merchandise, a fellow-clerk states, "from a distaste for business," and began the study of medicine with Drs. Bruce and Romaine. It was at this time, at the age of eighteen, that Drake and Halleck first met. In the summer of 1812 James E. De Kay, then a medical student pursuing his studies at Guilford, became acquainted with Miss Halleck, the belle of that ancient and enterprising New England town, who, before his return to New York, gave him a letter of introduction to her brother, who had the year previous gone, in Connecticut phraseology, "a-tradin' down to York." During the winter of 1812-13 Drake and Halleck were introduced by De Kay, and from a little incident which occurred while the three young men were sailing on New York Bay, in the spring of 1813, the party became warmly attached friends. It was a sunny afternoon, after a shower, when Halleck, in the course of a conversation on the delights of another world, fancifully remarked that "it would be heaven to lounge upon the rainbow and read Tom Campbell." Drake was delighted with the thought, and from that time they maintained a devoted friendship, only severed by death. When the young and handsome physician was married, in the summer of 1816, to a daughter of the eminent and opulent ship-builder, Henry Eckford, of New York, it was Halleck who officiated as groomsman; when he went to Europe with his accomplished wife, it was to his brother poet that he addressed several amusing poetical epistles; when their daughter and only child was born, she was christened Halleck; when the pulsations of his gentle heart were daily growing feebler, it was his faithful friend "Fitz" who, with more than a brother's love, soothed his dying pillow; and when the grave had forever closed over Drake, and his sorrowing friend had said, as Sir Walter Scott did when standing by the last resting-place of Johnny Ballantyne, "There will be less sunshine for me hereafter," it was the same sorrow-stricken friend who wrote those exquisitely touching lines so familiar to the English-speaking world, and which will ever continue to be among Halleck's and Drake's most enduring monuments.

One of Drake's resorts in the days when he and Halleck were in "the sugar and cotton line" was the residence of Colonel Russell, whose cook was celebrated for her succotash, a dish of which the young poets were extravagantly fond. It is, however, ques-

tionable whether the corn and beans of which it was compounded would have had sufficient attraction to draw them there so often had there not been domiciled under the hospitable roof of the venerable and gallant colonel certain young ladies—two fair Elizas—whose charms were celebrated by both of the admiring poets. Another of their haunts was the house of Mrs. Peter Stuyvesant, with whose nephew, Egerton Winthrop, Drake was afterward a fellow-pupil under Drs. Bruce and Romaine. The residence, long since destroyed, stood in the neighborhood of St. Mark's Church, with a beautiful lawn and gardens extending to the East River. They spent many happy hours in the old mansion, and often during their visits would take fishing-rods and proceed to Burnt Mill Point, near what is now Tenth Street. On one of these excursions, as a venerable contemporary reports, Drake had a nibble, when, giving a sudden jerk, he lost his fish, but, singular to say, brought up a beautiful bass whose tail had accidentally come in contact with his hook. "There, Fitz," shouted the elated embryo doctor, "I've caught a striped bass!" "No, no, Joe," answered Halleck, "I should say that he caught himself."

In alluding to the wonderful growth of the city, Halleck, a few years ago, remarked to the writer that in Drake's days his New-Year's calls were all, with a single exception, made below Canal Street. "Now, I suppose, you young gentlemen would decline visiting any one who did not live above Bleecker." The exceptional call was made upon Mrs. Stuyvesant; "and," said Mr. Halleck, "her residence was considered so remote that we always took a carriage to go there on New-Year's Day. She lived a few blocks south of the square which at present bears her name." On one occasion, upon entering the spacious mansion, the lady said to the poet, "My heart is broken." "Who is the base deceiver?" asked Halleck. "Ah!" replied the disconsolate widow, "it's not that; but the authorities are about to open a street through my garden!" That street is First Avenue; and since the poet's death the famous pear-tree which stood on the corner of Thirteenth Street and Third Avenue—the last vestige of Mrs. Stuyvesant's garden—Drake's favorite resort, and one of the landmarks of old New York, has been swept away.

Another of Drake's favorite haunts was the country-house of Henry Eckford, who resided several miles from New York. It is now in the very centre of the city. His fine residence, the approach to which was by a beautifully shaded avenue, called Love Lane, stood near what is now Twenty-first Street, between Sixth and Seventh avenues. Dr. De Kay and Halleck were also frequent visitors, and the quartette was completed by Charles P. Clinch, then confidential secretary to Mr. Eckford. Many jovial evenings

were spent by these young gentlemen under the roof of the rich Scotch ship-builder, and two of the number became his sons-in-law. Still another of Drake's resorts was Hunt's Point, the residence of a relative, by whose family—the Hunts—the property has been owned and occupied, till quite recently, for two hundred years. The old Grange, still in good preservation, situated at the southeast extremity of the Great Planting Neck, called by the Indians Quinnahung, was erected in 1688 on a beautiful point overlooking the East River, Flushing Bay, and Long Island Sound. Drake and his almost inseparable companion on all such excursions sometimes reached Hunt's Point by taking the stage to West Farms, about two miles distant, or drove out with Mr. Eckford's horses. Their usual course was, however, by hiring a small boat, which they rowed there in the afternoon, returning to town the following morning.

Langstaff's first appearance at Hunt's Point was described to me recently by a person who witnessed the amusing scene. It was on a summer evening in 1816 that the poets entered, followed by the eccentric apothecary, who was introduced by Drake to the lady of the house. She, in courteous terms, welcomed him to Hunt's Point, and expressed a hope that he was well. "By heavens, madam, I *am* well!" was Langstaff's reply, in a tremendously loud voice, which both exceedingly surprised and very greatly disconcerted the lady and her young female friends who were present, and who were unacquainted with the new-comer's eccentricities. Another of the ladies, who was an occasional visitor at Hunt's Point at that period, and who is now a resident of Philadelphia, said to the writer: "We were always delighted to see Mr. Halleck at Hunt's Point, as he would remain and entertain us, while Drake would be off in an old coat with his fishing-tackle;" adding, "Drake used to sing to us, and Halleck would delight us with his poetical recitations and amusing anecdotes."

The exquisite poem of *The Culprit Fay*, on which Drake's reputation as a poet chiefly rests, was written in his twenty-first year, and not, as it has always been said, in the summer of 1819. The production of his *chef-d'œuvre* arose out of a conversation in which he and his friends, Fenimore Cooper, Fitz-Greene Halleck, and De Kay, were speaking of the Scottish streams and their adaptation to the uses of poetry by their numerous romantic associations. Cooper and Halleck maintained that our American rivers furnished no such capabilities, when Drake, who was fond of argument, took the opposite side of the question, and to make good his position, produced, in three days, *The Culprit Fay*. The scene is laid in the Highlands of the Hudson, but it is notice-

able that the chief associations conjured up relate to the salt-water, Drake drawing his inspiration from a familiar haunt on Long Island Sound. In a manuscript copy of *The Culprit*, still in a good state of preservation, the author left a note ingeniously removing the difficulty:

"The reader will find some of the inhabitants of salt-water a little further up the Hudson than they usually travel, but not too far for the purposes of poetry."

On another manuscript copy of the poem, now before me, in Halleck's handwriting, is the indorsement herewith appended:

"The following lines were written by Joseph Rodman Drake, in New York, North America, August, 1816, and copied from the author's manuscript in January, 1817, by Fitz-Greene Halleck."

Writing to his sister, January 29, 1817, Halleck says:

"I send you herewith two manuscript poems, written by a friend of mine, Mr. Drake, whose name, I believe, I once mentioned to you. He is a young physician, about twenty. *The Culprit Fay* was written, begun and finished, in three days. The copy you have is from the original, without the least alteration. It is certainly the best thing of the kind in the English language, and is more strikingly original than I had supposed it possible for a modern poem to be. The other *Lines* were written to a lady after an evening's ramble near a river, on whose opposite bank a band of music was playing. 'Tis a hackneyed subject, but he has given it beauty and novelty. I will send you in a short time some other pieces equally good. . . . The poem was written in August last, since which its author has married, and, as his wife's father is rich, I imagine he will write no more. He was poor, as poets of course always are, and offered himself a sacrifice at the shrine of Hymen, to shun the 'pains and penalties' of poverty. I officiated as groomsman, though much against my will. His wife is good-natured, and loves him to distraction. He is, perhaps, the handsomest man in New York—a face like an angel, a form like an Apollo, and, as I well know that his person was the true index of his mind, I felt myself during the ceremony as committing a crime in aiding and assisting in such a sacrifice."....

In a torn and tattered fragment of another letter, Halleck, in allusion to Drake, remarks:

"Even to the most common and trifling subjects he will give an interest wholly unexpected and unlooked for. His manner of reading Shakespeare is unique, and to the bombast of our old friend Ancient Pistol he will give a force beyond description. He has a taste for music, and plays the flute admirably. As I owe to his acquaintance many a pleasant hour, he has become endeared to me, and I must apologize for dwelling so long on a picture the details of which are so uninteresting to one who has not seen the original."

Drake's own description of himself, contained in half a dozen hitherto unpublished lines, entitled *Moi-même*, present a ludicrous contrast to his friend's enthusiastic encomiums. They are without date, but were presumably written prior to his marriage, which placed him in affluent circumstances:

"A comical mixture, half bad and half good,
Who has skimmed over all things, and naught understood;
Too dull to be witty, too wild to be grave,
Too poor to be honest, too proud for a knave—
In short, a mere chaos, without form or rule,
Who approaches to all things, but nearest a fool."

Halleck's prediction, contained in the letter to his sister, would have probably proved true. Drake would have written little if any more but for the purpose of inciting to poetic effort his friend, of whose abilities he perhaps formed an exaggerated estimate, as expressed in the poem he addressed to Fitz-Greene Halleck, a few years after their remarkable friendship began in 1813. He was nobly ambitious for himself, but still more so for Halleck, to achieve poetic fame, and often urged him to act on Sidney's gallant and lofty motto, "*Aut riam inveniam aut faciam.*" He also vainly advised him to abandon "Jacob Barker and business," and to embark upon the career of a man of letters—a calling which Carlyle has humorously described as "an anarchic, nomadic, and entirely aerial and ill-conditioned profession." Drake, in his spirited address to Halleck, says:

"Are there no scenes to touch the poet's soul?
No deed of arms to wake the lordly strain?
Shall Hudson's billows unregarded roll?
Has Warren fought, Montgomery died in vain?
Shame! that while every mountain stream and plain
Hath theme for truth's proud voice or fancy's wand,
No native bard the patriot harp hath ta'en,
But left to minstrels of a foreign strand
To sing the beauteous scenes of nature's loveliest land.

"Be these your future themes: no more resign
The soul of song to land your lady's eyes;
Go! kneel a worshiper at nature's shrine;
For you her fields are green and fair her skies;
For you her rivers flow, her hills arise;
And will you scorn them all, to pour forth tame
And heartless lays of feigned or fancied sighs?
Still will you cloud the muse, nor blush for shame
To cast away renown, and hide your head from fame?"

There can be no doubt that to Drake's influence the world is more indebted than to any of Halleck's other associates for inciting him to produce some of his noblest strains, while we have evidence that the latter was inspired by the same generous ambition for Drake's fame, as shown by the following invocation to activity and exertion, which was addressed to him by Halleck some months before the invalid doctor sailed, in the spring of 1818, for Europe, accompanied by his wife and his friends De Kay and Langstaff:

"Come, then, dear Joseph, come away;
'Tis criminal to lose a day
With talents bright as thine.
Let indolence on beds of flowers
Consume the weary, lagging hours:
Action's thy nobler line."

A few days after Drake's return from his visit to Europe, of which unfortunately no memorials are preserved, with the exception of his humorous poetical epistles included in the life of Halleck, the young poets were spending a Sunday evening with Langstaff, who conducted a drug establishment in the basement of Drake's residence on the corner of Park Row and Beekman Street, the firm being Drake and Langstaff, when Drake, for

his own and his friends' amusement, wrote, on the spur of the moment, several burlesque stanzas *To Ennui*, Halleck answering them in some lines on the same subject. They decided to send their productions, with others of a similar character, to Coleman, the editor of the *Evening Post*. Drake accordingly sent three pieces of his own signed "Croaker," a signature adopted from an amusing character in Goldsmith's comedy of *The Good-natured Man*. To the astonishment of the trio of friends, a paragraph appeared in the *Post* the day following, acknowledging their receipt, promising the insertion of the poems, pronouncing them to be the productions of superior taste and genius, and begging the honor of a personal acquaintance with the author. The lines *To Ennui* appeared March 10, 1819, and the others in almost daily succession, those written by Halleck being usually signed "Croaker Junior," while those which were their joint composition generally bore the signature of "Croaker and Co."

The remarks made by Coleman had excited public attention, and "The Croakers" soon became a subject of conversation in drawing-rooms, bookstores, coffee-houses on Broadway, and throughout the city; they were, in short, a town topic. The two friends contributed other pieces, and when the editor again expressed great anxiety to be acquainted with the writer, and used a style so mysterious as to excite their curiosity, the literary partners decided to call upon him. Drake and Halleck accordingly one evening went together to Coleman's residence in Hudson Street, and requested an interview. They were ushered into the parlor, the editor soon entered, the poets expressed a desire for a few moments' strictly private conversation, and the door being closed and locked, Drake said, "I am Croaker, and this gentleman is Croaker Junior." Coleman stared at the young men with indescribable and unaffected amazement, at length exclaiming, "My God! I had no idea that we had such talent in America!" the delighted editor continuing in a strain of compliment and eulogy that put them both to the blush. Before taking their leave the poets bound Coleman to the most profound secrecy, and arranged a plan of sending the MS. and of receiving the proof in a manner that would avoid a possibility of the secret of their connection with "The Croakers" being discovered. The poems were copied from the original by Langstaff, that their handwriting should not betray them, and were either sent through the mail or delivered by Benjamin R. Winthrop, then a fellow-clerk with Halleck in the counting-house in Wall Street of the well-known Quaker merchant and banker, Jacob Barker, who died in December, 1871, at the age of ninety-four.

Hundreds of imitations of "The Croakers"

were daily received by the different editors of New York, to all of which they gave publicly one general answer, that they lacked the genius, spirit, and beauty of the originals. Coleman showed one of the poets fifteen that he had received in a single morning, all of which, with a single exception, were consigned to the waste-basket. The friends continued for several months to keep the city in a blaze of astonishment; and it was observed by one of the editors "that so great was the wincing and shrinking at 'The Croakers,' that every person was on tenter-hooks; neither knavery nor folly has slept quietly since our first commencement."

In a letter to Miss Halleck, dated April 1, 1819, her brother writes:

"Can you believe it, Maria, Joe and I have become authors? We have tasted all the pleasures and many of the pains of literary fame and notoriety under the assumed name of 'The Croakers.' We have had the consolation of seeing and of hearing ourselves praised, puffed, enlogized, execrated, and threatened as much, I believe I can say with truth, as any writers since the days of Junius. The whole town has talked of nothing else for three weeks past; and every newspaper has done us the honor to mention us in some way, either of praise or censure, but all uniting in owning our talents and genius.... As luck would have it, Joe was under the necessity of going to Albany, and I have been compelled to carry on the war alone for ten days past, during which time I furnished Coleman with one piece each day."

Of this series of satirical and quaint chronicles of New York life more than half a century ago, Halleck, in 1866, said that they were good-natured verses contributed anonymously to the columns of the *New York Evening Post* from March to June, 1819, and occasionally afterward. The writers continued, like the author of Junius, the sole depositaries of their own secret, and apparently withal, with the minstrel in Leyden's *Scenes of Infancy*, to

"Save others' names, but leave their own unsung."

The pieces were collected and surreptitiously published by some unknown person in a small 18mo pamphlet of thirty-six pages, and sold for twenty-five cents. The title of the brochure was "*Poems by Croaker, Croaker and Co., and Croaker Junior*, as published in the *Evening Post*. Published for the reader, New York, 1819." For a ragged and soiled copy of this pamphlet, issued in September, and which appears to have been the property of Dr. Langstaff, a dealer in literary wares in Nassau Street had the modesty to demand of the writer the sum of five dollars. In 1860 the Bradford Club of New York issued a handsome quarto edition, and in 1868 they were included, with several unpublished "Croakers," in an edition of Halleck's poems. In lieu of the original signatures the editor of the volume made known for the first time the respective author of each poem, indicating also by the

letters D. and H. the joint authorship of the literary partners, or, to quote Halleck's familiar words to the writer, that "we each had a finger in the pie."

Whoever among the present generation would desire to learn something of the leading men of the city and State, and of the social, scientific, and political events of a decade so interesting as that of 1819-29 in New York history, can not but be enlightened, as well as greatly amused, by a perusal of these poems from the pens of two such well-informed and witty men as Drake and his friend. I trust, however, that no one will understand me as meaning that there is any matter interposed in the shape of *précis* upon the affairs of that day, or that either of the poets was acquainted with the *arcana imperii* of that interesting period.

The surviving partner of the poetical firm told the late Frederick S. Cozzens that after Drake's proposal to form a literary partnership, many of the "Croakers" were written in this wise: he or Drake would furnish a draft of a poem, and one or the other would suggest any alteration or enlargement of the idea, a closer clipping of the wings of fancy, a little epigrammatic spur upon the heel of a line. I doubt very much whether I have the right to disclose the method by which poets work in their workshops, but as I am only repeating Halleck's ideas, I hold it to be no base betrayal of the craft. To show how delightful these joint labors were to both of these illustrious men, Halleck told me that upon one occasion, Drake, after writing some stanzas, and getting the proof from the printer, laid his cheek down upon the lines he had written, and, looking at his fellow-poet with beaming eyes, said, "Oh, Halleck, isn't this happiness!"

The *American Flag*, Drake's best-known poem, written in his own house between the 20th and 25th of May, 1819, originally concluded with the following lines:

"As fixed as yonder orb divine,
That saw thy bannered blaze unfurled,
Shall thy proud stars resplendent shine,
The guard and glory of the world."

These not satisfying their author, he said, "Fitz, can't you suggest a better stanza?" Whereupon Halleck sat down and wrote on the spur of the moment the lines, which Drake immediately accepted, and incorporated in his most popular poem:

"Forever float that standard sheet!
Where breathes the foe but falls before us,
With Freedom's soil beneath our feet,
And Freedom's banner streaming o'er us?"

Drake's nephew, C. Graham Tillou, to whom I am indebted for much of the original matter contained in this paper, is the fortunate possessor of the first draft of the poem. The four concluding lines are stricken out, and immediately below, in Halleck's handwriting, are added the lines commencing

"Forever float," etc. When the poem was first published it was introduced by Coleman, the editor of the *Post*, with the following remarks: "Sir Philip Sidney said, as Addison tells us, that he never could read the old ballad of *Chey Chase* without feeling his heart beat within him as at the sound of a trumpet. The following lines, which are to be ranked among the highest inspirations of the muse, will suggest similar associations in the breast of the gallant American officer."

Another of the literary recreations of the young poets "in those happy days when we only lived to laugh," as Halleck remarked to the writer, was the composition of sermons in answer to the Calvinistic discourses of Dr. Cox, then attaining considerable celebrity as an eloquent and promising divine. These sermons were delivered to a less numerous if not a less appreciative audience, consisting usually of De Kay and Langstaff. Unfortunately their manuscripts, which might have made a majestic volume, to be entitled *Drake's and Halleck's Sermons*, were not preserved. Alas that they should be lost to an admiring posterity!

Drake's physician, alarmed by his premonitory symptoms of consumption, advised riding, even to the extent of a horseback journey to New Orleans. The poet, although manifesting little anxiety about his health, and remarking to a friend, in reference to certain dietary restrictions, that when he sat down at the table the doctor's directions were forgotten, as a favorite dish, however hurtful in theory, could not be resisted, was at length prevailed upon to spend the winter in the South. A lady who sojourned for several months at the poet's residence during his absence informs me that he wrote alternately to Mrs. Drake and to Halleck, and that his letters and others' from New Orleans concerning the invalid's health were eagerly sought after by his troops of friends, who would besiege the house for news on the arrival of letters. Drake returned from Louisiana, where he enjoyed the tender and loving attentions of his sister Louise, then the wife of Judge Nichols, in the spring, fatally smitten with consumption. He lingered during the summer, growing daily weaker and weaker, and constantly ministered to by De Kay, Halleck, and Langstaff. The attachment displayed by the latter was extremely touching. For several months he continued daily, and occasionally as often as three or four times each day, to go up stairs from the shop to Drake's bedside, and say, with tears in his eyes, and with the tenderness of a girl, "My dear Joe, is there not something I can get for you?" or, "Can't I do any thing for you, Joe?" And the invalid would make him happy by devising some trifling commission for his affectionate admirer to execute.

Drake died September 21, 1820, his frame "weak as a broken wave," but his mental faculties clear and unimpaired, his smile as sweet and his eyes as bright as in his best days. When he first reposed in death, as I learn by a MS. from the pen of the poet's brother-in-law, the late Francis R. Tillou, "a circumstance occurred which, in superstitious times, would have established the idea that he was peculiarly a child of heaven. At midnight of the day he died the sky was quite cloudless; myriads of bright stars glittered there; and, like a glowing ball, the moon hung in the azure heavens, eclipsed, shrouded in a dark veil—an elegant type, a token of sympathy for the departure of a spirit once so warmly its votary." He was buried at Hunt's Point; and as Halleck returned from the funeral, he said to De Kay, "There will be less sunshine for me hereafter, now that Joe is gone." The inimitable monody on Drake by his literary partner has perhaps never been equaled for beauty and tenderness, as it has been surpassed in popularity by but few, if any, American poems. A low monument of black marble, surmounted by a quadrangular pyramid, rises above the grave where the poet's remains have reposed for fifty-three years. The inscription is on one side, and reads thus: "Sacred to the memory of Joseph Rodman Drake, M.D., who died September 21, 1820.

"None knew him but to love him,
None named him but to praise."

These lines were afterward slightly varied and improved by their author, and now read:

"None knew thee but to love thee,
Nor named thee but to praise."

When Drake was on his death-bed, at his wife's request Dr. De Kay collected and copied all his poems which could be found, and took them to him. "See, Joe," said he, "what I have done." "Burn them," said the dying poet; "they are valueless." A fastidious selection of her father's poems was, however, made in October, 1835, by the poet's daughter and only child, who fitly dedicated the volume to Fitz-Greene Halleck, who was once solicited by a publisher to write a memoir of Drake, but declined. He remarked to a friend, in alluding to the subject, "What could I say about a young poet whose uneventful career was closed at twenty-five? I should necessarily have been as brief as Stevens, whose life of Shakspeare was compressed, as you remember, into some half dozen lines."

Something more than a score of years after Drake's death, Halleck, in an epistle to a lady who was associated with their happiest hours at Hunt's Point, said:

"Gone are the days of sunny weather
(I quote remembered words), when we
'Reveled in poetry' together,
And frightened leaves from off their tree,

With declamation loud and long,
 From epic sage and merry song,
 And odes and madrigals and sonnets,
 Till all the birds within the wood,
 And people of the neighborhood,
 Said we'd 'a bee in both our bonnets.'
 And he sat listening—he the most
 Honored and loved, and early lost—
 He in whose mind's brief boyhood hour
 Was blended, by the marvelous power
 That Heaven-sent genius gave,
 The green blade with the golden grain,
 Alas! to bloom and beard in vain,
 Sheathed round a sick-room's bed of pain,
 And garnered in the grave."

"A man that is young in years may be old in hours," remarks Bacon, "if he have lost no time; but that happeneth rarely." Measured by such a standard, judged by what he did, Drake's life was longer than that of many a man who attains the allotted threescore and ten. It is perhaps idle now to speculate as to what his poetic genius could have produced had he been spared to the world like Dana and Bryant and Longfellow, or even to the age attained by his poetic favorites, Burns and Byron. Many of his poems were left unfinished, among the number one entitled *Leon*, clearly manifesting his knowledge of the human heart. The first part of this incomplete work appeared in the published volume of Drake's poems; the second part—a fragment—is appended to this paper, and is now printed for the first time.

LEON.—PART II.

"The course of true love never did run smooth."—*Shakespeare*.

I wish I had a small secluded spot,
 Some wild-wood dell and bower-enshaded grot,
 Where never glimpse of human face was seen,
 And none but fairy feet have trod the green,
 That with one trusting friend who loved me well,
 Unseen, unknown, I might forever dwell;
 And, far from woman's spell, sequestered move
 Beyond the doubts, the fears, the crimes, the woes,
 Of love.

Poor son of sorrow, child of sighs and tears,
 Born in wild hopes, and nursed in wilder fears,
 Short are the joys that glad thy weeping eyes
 As rainbow tints that vanish while they rise,
 Glimpses of heaven that only serve to show
 The double deepness of succeeding woe.
 Oh, why, sweet cherub of celestial birth,
 In mercy sent to light and warm the earth,
 Why are thy purposed gifts forever lost,
 Crushed by cold prudence, or in passion tossed?
 Still the warm hearts that bend to thy control
 Must bend in sorrow, or in frenzy roll,
 And reason only wakes to tell despair
 How blest they might have been, how curst they are.
 But why should dark, foreboding dreams destroy
 The fleeting forms of momentary joy?
 Why damp the bliss with such presagings sad
 While eyes around are bright, and hearts are glad?
 For her, in every corner of the place,
 Dressed up in smiles is seen each happy face,
 Grandfire and crone, brisk youth and maiden gay,
 And children pranked in holiday array
 Around the castle stand, or sit, or trip,
 Joy in each eye and smiles on every lip;
 While talk and whisper buzzes far and wide,
 Of the brave bridegroom and the bonny bride.
 Some crowd the gates, some lie along the grass
 On the green road through which the train will pass;
 Some, more impatient to behold the band,
 Around the chapel archway take their stand,

• Joseph Rodman Drake.

Or, climbing to the windows, strive in vain
 To send their glances through the painted pane.
 The nearest bend their ears toward the lay,
 And strive to hear, although they can not see;
 While some, more daring, forward thrust the chin,
 And set the door acrack and peep within.
 Oh, 'tis an awful and a glorious sight!
 The dim sun flings his unstained light,
 The flame-tipt columns of the altar torch
 Strike a long gleam along the fretted porch,
 And lustres, with their branchy arms outspread,
 From pendent drops ten thousand sparkles shed;
 The velvet surface of the pulpit pall
 In gentle waves and crimson flashes fall,
 While the gay arches of the ceiling throw
 Broad, massy shades and darkening streaks below.
 Then might you see, with nod and smile and stoop
 Of knights and dames, a gallant, joyous group,
 Filling the space, and glancing here and there
 A brilliant eye, or turning smooth and fair
 A neck of marble white, or with a bow
 Shaking the plume that quivers on the brow.
 Within the altar palling stands the choir,
 The mitred priest, the cowed and shaven friar,
 And novice boy, who with a holy look
 Carries the pyx, or bears the sacred book,
 Or, as the words of reverent praise are spoke,
 Heaves to the Saviour-cross the curling incense
 smoke.

But hark! from yonder sable-curtained dome
 In long low strains the feeble voices come,
 Swell, fall, subside, and as the murmur dies,
 Full, clear, and strong the solemn chantings rise,
 And gentle organ stops, with breathing sound,
 Like songs of distant angels, float around;
 And now they mingle, pause, and now alone
 Peals in deep majesty the lengthened tone;
 Slowly, as sinks the faint receding wall,
 The cowed priest advances to the pale.

JOSEPH RODMAN DRAKE.

In the history of literary partnership I know of none more beautiful than that of the sweet companionship of Drake and Halleck. Genius does not readily amalgamate; hence partnerships in the literary world are more rare than they are in the commercial. Almost the only parallel to the young American poets is that of Beaumont and Fletcher, "the rich conception of whose twin-like brains" sprang from an equally thorough and genuine union of congenial minds. In both cases the poet-partners had much besides genius in common. Contemporary critics give to Beaumont the credit of restraining the exuberant wit and fancy of Fletcher; but truly, such was the "wondrous consimilarity of fancy," as Aubrey calls it, between them, that it is utterly impossible to guess at the share of the dramatists in the plays bearing their joint names, for there is nothing to distinguish them in any way from those written by Fletcher after the grass was growing over his friend's grave. The same, I think, may be said of those sprightly *jeux d'esprit*, "The Croakers," concerning which the public were equally in the dark respecting the source from which individual poems emanated, even after it was well known that they were the handiwork of the literary partners Fitz-Greene Halleck and Joseph Rodman Drake, the Damon and Pythias of American poets.

"TINA."

"ALWAYS missing their opportunities," grumbled the doctor; "always getting into the wrong places, somehow, and doing the wrong things. That is the way with people. Now there is Welby—look at Welby: the idea of Welby settling down into a country parson simply because his mother's aunt regarded the Church as his vocation, and could have made it inconvenient for him if he had disagreed with her. Dear me"—dropping suddenly into a wearied sort of abstraction, and staring at the brown-stone front on the opposite side of the street—"what fools women make of honest men sometimes, and—what knaves!"

It seemed as if the sight of the brown-stone front was suggestive, and added a spark to a new train of thought, for he sighed again, and rumbled his shaggy hair with his large white hand in an odd, disturbed fashion.

"And Durant," he said, in a lower voice, "kindly, gentle little fellow as he is, made for home life, and simple, tender home pleasures—to think of his marrying a woman like that, and being worked to death by her, and disappointed to the core of his soft heart by her, and dragged from post to pillar, to her balls and parties and feasts and watering-places! God bless my soul"—shaking his broad shoulders like a big water-dog—"what a blunder it was! And then there's the child," he went on the next minute, "and that slip of a governess girl, with her novels and her romance and her big lost-looking dreamy eyes. What right has a pretty, silly, vague creature like that to make a governess of herself? What does she know about moulding a child's mind, and rooting out evil tendencies, and checking little offshoots of wrong, and all that sort of thing? She's a baby herself. Ah! there she is at the window—star-gazing, I suppose."

The nursery was in the highest story of the house, and the house was a large one, so the window at which the solitary young figure stood was high enough, and near enough to the stars for all star-gazing purposes. The window itself was thrown open, and the light within showed the girl leaning upon the sill and resting her chin on her hand. But she was not looking up; she was looking down. The stars her forlorn girlish eyes saw were the twinkling street lamps, stretching themselves down the street in a narrowing vista. If the doctor himself felt rather neglected and out of sorts to-night, he was not alone in his temporary dejection, for his young acquaintance across the way was out of spirits too. It was so lonely in Teddy's pretty nursery there when Teddy was asleep, and the world that seemed so far below the high window was all lighted up, and Teddy's mamma was out enjoying

herself in all her bravery and beauty, and even the servants were having a sociable sort of gathering in their own domains.

"It isn't so dreadful in the daytime, when Teddy talks and people seem to be properly alive," said Tina, her great melancholy black eyes roving here and there until at last they settled on the doctor's study window. "I suppose it is because I am up here all by myself in the silence that every body who passes appears like a sort of ghost. There is Doctor Theobald looking out, and he looks like a ghost too. I wonder what he is thinking about? It would be safe enough to ask him from here; one needn't be afraid of being answered. What are you thinking about, Doctor Theobald?" she said, softly; and she gave him a little nod under cover of the darkness, a slow, dreamy smile touching her lips.

She had observed him far oftener than he had observed her. He had been an object of interest to her from the first day of her arrival, when she had seen his comfortable carriage drawn up before the pavement, and had watched for his outcoming with the dreary curiosity of utter loneliness. Her life at the third-rate boarding-school at which she had been educated had not been a pleasant one, but she had become used to its dull routine, and being only a girl, there had been other girls among the fifty third-rate pupils whom she had learned to like, and whom she was sorry to leave. There had been poor, much-snubbed Jenny Ackersbury, whom she had clung to and pitied simply because Jenny was the shabbiest and loneliest and least popular among them, because her bills and her lessons were always behindhand, and her weekly allowance was such a spectre and mockery. She had cried over Jenny piteously when she had bidden her good-by, and she had given her a new cherry-colored neck-tie, with vows of eternal fidelity. Indeed, she had cried over a great many people that last day, and had not even been able to restrain her emotion over the farewell glass of severely tart currant wine condescendingly presented to her in the snuff-colored parlor by Miss Bilkerson the elder, whose habit it was to preside solemnly upon all such occasions. She had felt a yearning even toward the Misses Bilkerson, notwithstanding their rather sharp discipline. So when she had landed at her destination, with her sole worldly possessions in her small trunk, she had felt her desolation strongly. She had neither father nor mother. A distant relative had educated her rather grudgingly, with the understanding that, once educated, she must take care of herself; and there the matter stood. She was educated as far as the Bilkerson resources went, and a situation as nursery governess had been supplied her, and she was considered provided for. But after her

first awkward attempt at putting Teddy to bed, she had been ungrateful enough, despite this bounty, to cry herself to sleep, with a half-frightened feeling of desolateness, and a terrible longing even for the weak tea, thick bread-and-butter, and narrow bed of the Bilkerson establishment. She would have had Jenny and Georgina Blair and Sophy Adams to confide in at least if she had been there, and here there was nobody.

But in a few days the grandeur about her began to attract her attention somewhat by its novelty. She found out that Mrs. Durant was young and a beauty, and that she lived a wondrous exciting life, full of what seemed to her young nursery governess the most gorgeous romance, though it was withal a trifle startling in some of its fashionable phases. She wore dresses such as Tina's favorite heroines indulged in, and seemed to have been every where; in fact, she interested her inexperienced admirer so deeply that Jenny received a six-page letter upon the subject, and all Miss Bilkerson's elder pupils were stirred with envy and excitement for a week. But it was not very long before Tina lost her eager interest in the mistress of the household, or at least lost the greater part of it, and by that time she was beginning to be fond of Teddy. She could not have lived without a fondness for somebody or something, and the pretty neglected child wound himself round her soft, impressionable heart. She was not so awkward about dressing and undressing him after all, and in a certain inexperienced and perhaps rather desultory fashion she managed to teach him for a short time each day, though the truth was, she was more nurse than governess. She took him out every morning, and it was in one of these morning walks that the doctor had first encountered her strolling on the grass in the nearest park, an open novel in her hand, and her small charge wandering before her. The fact was, she had been so much interested in her book that she had almost tumbled over the doctor, and had looked up at him with such a frightened start, and such an almost childish appeal in her great melancholy eyes, that he had smiled in spite of himself. They had often met since then, though they had not spoken to each other, and Tina had watched the great man from her nursery window, never dreaming that now and then he was watching her too. In his profession Dr. Theobald was a great man. He had done much for science, and his fellow-workers regarded him as an authority; he had been a man of ideals and enthusiasms, and had possessed courage and power enough to live up to them. He had even become a fashion, too, with great people who would never be great enough to understand him. He had been generous and steadfast, and had reaped his reward as few men have the for-

tune to reap such rewards. So Tina heard of his fame and prowess more than once, and in her innocent romantic admiration for all great things, became quite interested in secret. She liked to watch him from her window when the study was lighted and she could see him at work; she liked to weave grandiloquent romances about him; she even went so far as to plan a three-volumed novel, built upon one of her pet plots, of which he was the hero, and a certain large-eyed, rather vague young person, who died early, after a most touching death-bed scene, the heroine. It was because Ethelinda had died young that he had not married. Sometimes she even fancied that she could tell by his air when he had been to visit the spotless cross of marble on which was inscribed her name, "Ethelinda," and nothing else. She would not have been sorry to have been Ethelinda herself, and died young, and have been mourned for by such a man.

"He looks so kind," she said, watching him. "I don't think I should fancy he was a great man if I had not been told."

In truth, Dr. Theobald was a sort of companion for her in many of her lonely hours. She talked to his silent, unresponsive figure often when she was tired of her novels, and Teddy was asleep; and the fact that he seemed entirely unconscious of her existence at such times was to her the great charm of her conversations.

But she did not talk to him long this evening. In a short time he turned away from the window, and was lost to her sight for a few minutes, and when he appeared in view again he had his hat on, and was drawing on his gloves.

"He must be going out," murmured Tina; "I dare say to see a patient—perhaps a poor one. They say he is very good to poor people." And she watched him until he left the room, and then watched him descend the stone steps into the street, and then she smiled her dreamy, half-unconscious smile again. "Good-night, Dr. Theobald," she said; and when he was out of sight, she turned away from her window.

The room seemed more silent and desolate than ever. Teddy's soft regular breathing only added to the general loneliness. She took up a book and turned the leaves listlessly, but she was too restless to read, and even the adventures of one of the most thrilling of heroines failed to interest her.

"It is very tiresome," she said, with a little yawn. "I wish I dare go out." And then, brightening suddenly, "And why can't I? It is not late, and I could buy Teddy's birthday present to-night instead of waiting until morning."

It was such a novel idea, this one of going out into the world below herself, and having a share of the light, and passing to and fro, that it quite took possession of her, and

in two minutes she was standing before the glass buttoning her sacque up to the throat, and tying her hat under her hair, feeling half excited and half timid. She had promised herself the luxury of buying Teddy a modest birthday present. No one else would remember him, poor little man! and it would be so much nicer to have it ready for him as soon as he awoke; and then where could be the harm of going out? Miss Bilkerson had often gone out shopping at night.

So it came about that, an hour later, Dr. Theobald, turning the corner of the street on his way home, was startled by the sound of his own name uttered in a girlish voice, with such a ring of terror in its tones that he turned in some alarm.

"Doctor!" the cry came to him. "Dr. Theobald! Oh! please, please!"

He saw what it meant then. Two rough-looking fellows, who had evidently been annoying some one, turned sharply away, and were out of sight before he could reach the spot where they had stood, and a girl who had broken loose from them flew to meet him in such a tremor of fright that for a moment she could not speak.

"Don't be frightened," he said, kindly; "I will take care of you. Take my arm and stand still for a minute or so. You are scarcely equal to walking just yet. There, there!" patting her small, cold, clinging hand soothingly. "You must not cry. Nobody shall hurt you."

"I am little Teddy Durant's governess," she said, lifting her face and showing him her great eyes, almost wild with her childish terror. "I am Tina Floyd, and I went out to buy him a birthday present. And as I was coming home those dreadful men followed me, and they would talk to me, though I begged them to go away. And one of them tried to kiss me, but I saw you just in time, for as soon as I called you they ran away. I can't tell you how thankful I am to you—I can't, indeed." And she ended with an innocent sob and a fresh burst of tears. "I should have *died* if he had kissed me!" she cried, clinching her little hand; "I should have *died*!"

Her hat had fallen off in the struggle, and hung by its elastic from her hand just as she had caught it, the tears in her eyes, the passionate little air of fear and disgust in her whole face and figure. Even this last childish, angry gesture itself roused in her deliverer's mind a curious sort of interest and admiration.

"I am very glad to have been of service to you," he said, rather awkwardly.

"I am afraid," faltered Tina, "that I ought not to have been out alone, but I did not think that any one could be so—so cruel, and it is so dull in the nursery after Teddy is asleep. I shall never go out by myself again."

"I think," said Theobald, "that I would not, in your place. You are too young and—unaccustomed to the city." But he had barely escaped adding "too pretty," which was the truth.

They were only a few yards from the house, and when they reached it, Tina turned round upon the threshold with a timid, troubled air.

"I beg pardon," she hesitated—"but if you would not mind my saying so, I should like to ask you not to mention it to—any body. I am afraid Mrs. Durant might be angry, and if she were to send me away from here I have nowhere else to go."

"I will say nothing about it," he replied. "You may rely upon me." And he held out his hand to her.

The small brown glove touched his timidly. "Thank you," said Tina, "and good-night."

* * * * *

It was quite natural that she should take a greater interest in the tall, loose-jointed figure, and its passings to and fro from the house to the carriage, and from the carriage to the house, after this. She felt as if she had a greater right to be interested now. He had been kind to her too, and she was grateful as well as admiring. When he met her in her walks he always bowed to her as if he had not forgotten, and once or twice he stopped and asked about Teddy, in that kind yet half-abstracted way of his. It was because he had so much to think about that he had that abstracted air, Tina fancied. She did not know that he was so little used to the society of women that even the dark eyes of a pale-faced young governess made him somewhat awkward and confused. She sometimes saw him at the house, when he came to spend an evening with Mr. Durant, and he often looked thoughtful and careworn; so she was sure that it was because he was so overworked and studious.

But she was destined to gain a nearer view of the greatness she set so far apart from herself and her ignorant girl's romance. One winter night, as the doctor sat at work among his books, a visitor was announced, whose hurried entrance roused him abruptly from his studies. It was Mrs. Durant's nursery governess, her pale young face looking paler than ever under the black shawl she had thrown over her head, and her eyes full of tears.

"I do not know what is the matter with Teddy, Dr. Theobald," she cried, breathlessly. "I think he is dying, and Mr. and Mrs. Durant are out. You will come, won't you? We don't know what to do, and the servants are so frightened that I was obliged to come for you myself."

"I will come at once," he said, and hurried out of the room with her, muttering two words to himself, "Poor Durant!"

But when he saw Teddy he said, "Poor little fellow!" Teddy was in strong convulsions, and a French cook and an Irish chamber-maid were wringing their hands over him. The other servants had followed their mistress's example, and gone out.

"Nobody but a slip of a school-girl," he said, in a vexed under-tone. "The wrong place again. Poor child!" And he scarcely knew whether he meant Teddy or his governess by this last pitying phrase.

But in ten minutes he reproached himself for having been so rash. She was not so awkward after all. She touched the little fellow with hands so deft and tender that he saw she might be trusted, and in all service for him she was so ready and simply tractable and gentle that she might have shamed an older and wiser woman. And once, between the convulsions, when the child was quiet for a few minutes, and lay with closed eyes in her arms, she took the little hand that rested on her bosom and touched it softly with her lips, with a sorrow his mother might have shown.

"I love him," she said; "and he loves me. Don't die, Teddy—don't die!"

Theobald remembered this when, at midnight, Mrs. Durant returned. She came into the room in her rich dress, a feverish flush on her beautiful face, a tired-out look in her eyes, and, standing at Tina's side, she looked down at the child with an air half impatient, half wearied.

"Is he really ill?" she said. "I hope not. I don't understand children, and Mr. Durant is so easily frightened! He does not look ill now, but I suppose he is better than he was. You are very kind to pay him so much attention, doctor."

She did not remain in the room long. She was worn out, she said, and nervous; and indeed she seemed both. If she was wanted, Tina must call her. And so she left them, sighing a little as she turned away.

But she was not disturbed. When Dr. Theobald left the house, Tina was sitting at Teddy's bedside, with that soft, almost motherly look on her pale girlish face, and it was plainly her intention to remain at her post all night. "I would not like to leave any one with him who might fall asleep," she said. "And I am sure I shall not fall asleep. I couldn't, you know, while I am so anxious about him."

Mr. Durant was away from home, and his wife's engagements were of such a nature that she had little time to spend in the nursery; and besides, as she had said, she did not understand children. So this was by no means the last night Tina spent with her charge. In fact, she spent both day and night with him. When he was a little better, she played with him and tried to amuse him, with a simple patience which

quite touched Theobald's heart; and when he was not so well, she nursed him, sang to him, and carried him to and fro in her slender arms, without a shadow of impatience at his childish fretfulness. Often and often, when the lights were burning in the nursery at night, Theobald, standing at his study window, saw the slight pretty figure pacing slowly and rather wearily backward and forward across the floor, with its burden in its arms; and watching it, he went back to certain old grumbings of his about this "pretty, silly slip of a governess girl." There was something in her after all—there must be, notwithstanding her big melancholy eyes, and her romances and novels and school-girl ways. She was very shy and timid in her manner toward himself. Indeed, she was so evidently afraid of him that sometimes he almost fancied that he lost patience with her. But that way of hers with the child—that unselfish, uncomplaining, simple tenderness—always moved him.

As to Teddy, he was in rather an uncertain condition, sometimes better, sometimes worse; sometimes promising to be strong enough to run about very soon, and then again falling back into weakness or fever, or some other state equally discouraging.

"Late hours and polite dissipation and fashionable folly have left their mark upon him," growled Theobald to himself. "What can one expect with such a mother?" The great Dr. Theobald, be it known, had certain old-fashioned notions of his own.

But with Tina's help the boy wearied through a few changeful weeks without seeming at any time so seriously ill as to give rise to fresh alarm. But at the end of the month a sudden change came, as it were, without a moment's notice. He had been a little stronger, to all appearances, for a day or so, though he had been more than usually fretful; and one evening Dr. Theobald, making his daily call, found him lying upon the hearth-rug watching Tina, who knelt near him, building a castle of blocks, and at the same time telling him a story. He was very much interested, and rather resented Theobald's entrance upon the scene.

"I'm very well, only I've got a headache," he said, with a queer old-sounding sigh. "Tina can'tend to me. Go on, Tina. 'And so the giant carried the beautiful lady to the castle, and dragged her into the dungeon—and that's the dungeon—by her golden hair, and—' Go on."

"In a minute," said Tina, raising her eyes to Theobald's. "I think he is better, thank you, and he is very good about his medicine."

When Mrs. Durant came in to see him before going out that night, she thought that he was better too, and said so to Tina, with a relieved air.

"I hope he will be quite well by the time

Mr. Durant returns," she added, and then kissed him, and bade him good-night.

But at half past ten a messenger flew across the street to Theobald with news that struck him with alarm. Teddy had been seized with convulsions again, and seemed worse than ever. And when the doctor entered the nursery, he saw that all was over.

"Send for his mother," he said, briefly.

But no one knew where she had gone except the coachman who had driven her. The household seldom knew where she spent her evenings.

"And Mr. Durant is away on business," said Tina.

They did their best, but every effort was useless. The time had come now, and the hours of the brief life were numbered. Tina could not believe it; she could not believe the truth even when she read it on Theobald's face.

"He can not be going to *die*," she cried. "He was so much better only a few hours ago! I told him stories until he fell asleep."

She had never seen any one die in her life, and a strange awe took hold upon her when at last she began to realize what was going to happen. Only her innocent love supported her. Would it hurt him to die? Would he be afraid? Would he know?

It was midnight when the end came, and Theobald was with her, standing at the bedside. The convulsions ceased, and a slow, subtle change began to creep over the childish face. There was a new pallor, a faint gray shadow, as it were, a curious solemn settling of the pretty features, at the sight of which Tina broke into a low hushed cry.

"Doctor," she said—"doctor, look! Oh, what is it?"

He touched her trembling hand in kind restraint.

"It is death," he said, gently; "but you need not fear it. Why should you?"

But it was not exactly fear that stirred her so deeply. It was something else. He was so all alone, poor little fellow! All the sorrow in her innocent affectionate nature broke forth in one burst of grief at that moment.

"And his mother is away!" she said; "and there is no one to say one little prayer, or to help him to say one if he could speak! Oh, let me speak to him—let me try! I taught him a little prayer once, if he could remember it. Teddy dear! oh, Teddy dear, look at Tina!"

Perhaps it was because her voice had made itself dear to him that it had power to reach the dulling sense. His languid eyes opened slowly, and fixed themselves wearily upon her face. She had knelt down beside him, and she took his hand, bending over him, weeping softly.

"If Teddy could remember his prayer," she said, tremulously—"if Teddy would try

to say it!" He looked at her for a few seconds, and then his eyes, still fixed upon her, filled with a sudden light—a mysterious, awful, unconscious brightness.

"When I lay me down to sleep," he murmured, slowly, "I pray—the Lord—my soul to—keep."

"And if I die—" said Tina.

"Before I wake," the slow, child's voice went on, sinking a little, "I pray—the Lord my—my soul to take. Amen."

"Amen!" said Tina. "And good-by, Teddy; good-by." And she hid her face upon the small hand, for as the "Amen" died away the mysterious, awful brightness suddenly died out, and left the little face upon the pillow fair and cold.

"Don't cry," said the doctor, touching her on the shoulder a few moments later. "It is far better as it is."

* * * * *

It was a terrible blow to Mr. Durant, but he made no outcry over it. It was not his way to be demonstrative. Perhaps his time for that was past. Chance brought him home the next morning, entirely unprepared to hear the news, and he found his boy laid in his coffin, the household full of mourning, and his wife shut up in her room, all responsibility having fallen upon Tina and Theobald.

He went to the darkened chamber of death, looked at the solemn, childish figure for a while in a stunned silence, and then spoke to Theobald.

"Where was Belle when—when this happened?" he asked.

"She was out. It was very sudden. She did not know."

He bent over the coffin, and with a trembling hand moved a flower.

"She was out," he said, in a low, hard voice. "And did not know?" Then he looked up suddenly. "Was *any body* with him?" he demanded.

Theobald laid his hand upon his shoulder.

"Miss Floyd was with him," he said, "and I myself. He was not alone."

"Thank you," brokenly. "I did not even know that he was ill. She did not tell me."

After the funeral was over, and the sorrowful excitement had to some extent passed away, Doctor Theobald, in his study, began to look at the nursery windows across the way with a new wonder. What were they going to do with the governess? What would she do with herself, rather? And then remembering that simple speech of hers, "I have nowhere else to go," he felt a little disturbed. She was not the sort of girl who might safely face the world alone. And then his mind would return to that simple, sorrowful scene at the bedside, to the slight kneeling figure clasping the little listless hand, to the innocent prayer so innocently uttered, to that last Amen, when the awful

brightness died out, and to the sad, low cry, "Good-by, Teddy; good-by." And somehow or other, sad as the picture was, he would not have forgotten it for a great deal.

He did not see Tina for several days after the funeral; indeed, might not have seen her again at all, but that, going to the house one morning, he saw a cab standing before the door with a small trunk upon it, and hurrying up the steps, he met the girl face to face.

She was looking paler and more youthful than ever, he thought; and when he held out his hand to her, she made a poor little effort at a smile.

"I am going back to Miss Bilkerson's," she said, in rather a timid way. "They were so good as to say that I might come and help to teach the little ones until I could find somewhere to go. You know there is nothing more for me to do here. Good-by, Dr. Theobald."

It was a curious thing to acknowledge, even to himself; but the truth was that he had never before felt exactly the pang he felt that moment at the tone of her simple "good-by, Dr. Theobald." She spoke somehow as if they were so far apart from each other that it was impossible that he could care very much—as if it had never presented itself to her mind that he could be moved by her going or staying. And, indeed, such a fancy never had presented itself to her mind. How *could* such a man be touched by any thing that happened to her? Only Tina Floyd, who knew barely enough to make a nursery governess, and who had no friends but the third-rate pupils at the third-rate "seminary for young ladies." There was a little pain at her heart when she remembered how far she stood below him; but romantic and ignorant and fond of novels as she was, she had never had any sentimental fancies of Dr. Theobald's descending to her level; so if she said "good-by" a little sadly, she said it quite simply, and left him no alternative but to reply in the same manner.

"Good-by," he said. "I am sorry it is good-by, though. I have been wondering what you would do."

"Thank you," she answered; "you were very kind to think of me. Every one is very kind. Mr. Durant"—but there her voice faltered somewhat—"Mr. Durant has been very good to me," she added; "and he said it was for Teddy's sake."

The cab drove away ten minutes after, and left Theobald standing upon the stone steps feeling curiously disturbed.

"Back to Miss Bilkerson's," he said to himself. "Is that the right place, I wonder? Let us hope that Miss Bilkerson's will treat her well."

So back to Miss Bilkerson's Tina went, and

was re-installed in the bare bedroom with Jenny Ackerbury, and taught the smaller pupils grammar and geography, and was rather envied as one who had seen the world. She was as fond of Jenny Ackerbury, too, as ever, and as ready to help her and listen to the relation of her woes; and yet Jenny Ackerbury, with all her dullness, saw what Tina did not know herself, namely, that a change had come over her, that the melancholy black eyes had an absent look sometimes, that now and then they seemed sad or wistful.

One day, walking at the head of her procession of pupils, the elder Miss Bilkerson saw that a gentleman, in passing, bowed to somebody behind her, and turning with some sharpness, she found that it was Tina who had been bowed to, and that Tina looked frightened. She beckoned to her with her parasol.

"Who was that—person who bowed to you?" she demanded, when the culprit came.

"It was Dr. Theobald," said Tina. "He was Mr. Durant's family physician, and when Teddy was ill I saw him very often."

"Is it *the* Dr. Theobald?"

"I think so," Tina faltered. "He is very celebrated."

"Oh!" said Miss Bilkerson, in a rather mollified tone. "You may go back to your place."

And Tina went.

She had a great deal to do at Miss Bilkerson's, and her small charges kept her very busy, and yet the time seemed to pass very slowly. She did not find another situation for so long that she had quite settled down into her old place, when the prospect of a change came, and even this, when it came, was the prospect of such a change as she had never dreamed of.

She was sitting by the piano in the parlor one afternoon, giving a music-lesson to a dull little girl, and feeling rather weary and spiritless, when a ring at the front-door attracted her attention, and in a moment or so more some one was ushered into the room. She rose from her seat rather hurriedly; but when she confronted the visitor, she turned first red and then white. It was Dr. Theobald, and Dr. Theobald advanced toward her with outstretched hand.

"Miss Floyd!" he said. And then in a strange voice, almost as if he could not control it, "Tina!"

She did not know what to say. Often as she had thought that she would like to see him again, she had never fancied that the sight of his face and the sound of his voice could move her as it did. She scarcely dare trust herself to speak. And yet, of course, he could only have come on business.

"Miss Bilkerson is in the school-room," she faltered. "Did Janet take your name?"

"No," he said, with a curious, almost des-

perate decision. "It was not Miss Bilkerson I came to see. Can you postpone the rest of this music-lesson?"

"I think it is finished," said Tina. "You may go up stairs again, Nannie."

But when the child had left the room, she was so frightened that she would have liked to run away herself. She felt as she had never done before. She was full of a strange tremor, and could not look up. And in a few moments she became conscious that her visitor was disturbed too. The hand with which he held hers was unsteady, and for a little while he did not speak—only stood looking down at her drooping face. But at last he broke the silence. He led her to the sofa, and made her sit down.

"Will you sit there," said he, "and have patience with me for a little while?"

She could not make any pretense at being calm, or believing that he was calm. She said "Yes" in a low, timid voice, and sat still, looking at the pencil with which she had been pointing out notes to her pupil. Theobald turned about and began to walk up and down the room before her, his hands clasped behind him, a singular excitement in his manner.

"Tina," he said, "I have come to make an appeal to you."

"To me?" she said, with an innocent start.

"To you," he went on, his voice shaking. "And it is such a presumptuous appeal that I can hardly hope that you will hear it to the end. I have been passing through a sort of mental crisis lately. I have been slowly discovering that—that my life is worth very little to me without one thing which you have taught me to long for. I do not know exactly how it has been that all my life I have somehow or other missed what usually comes early enough to both men and women. Perhaps it has been through some fault of my own. I dare say it has, but now the longing has come, and I can not bear it. I have been a man of fancies and theories. I have had theories of wrong and right. I have even had a theory about *you*; and it has ended in this way, that you, innocent child, have taught me that I was a blundering fool, wise only in my own stubborn crotchets. Nay," turning round to her, pale-faced and humble, agitated beyond measure—"nay, let me end. I have not words to tell you how I have learned all this. Only I love you—I love you!" And then that moment he was kneeling at her side, holding her small cold hand, and bending down to kiss it with a wondrous reverence.

Tina, trembling, could only let him hold and kiss it. The little pencil slipped down upon the floor. Was this herself—Tina—whom the Misses Bilkerson snubbed, and

who had nobody but Jenny Ackerbury to care for her much? Was this Dr. Theobald, of whom she had thought in that sad secret way as a hero, who would forget all about her because she was not worth remembering? A wild bliss filled her heart, and a little sob broke from her throbbing throat.

"You are so young," said Theobald, almost mournfully, "that it is hard for you to understand all at once; and I do not ask that you will. Only I have thought of it so long alone that I could bear it no longer, and to-day I vowed to myself that I would tell you, and ask you at least to let me try to teach you to think kindly of me—only that until you are ready. God knows I would rather lose my poor life than shock or wound you. Will you say that I may come here to see you and try? I will speak to these people and make them understand, if you will only say that I may."

There was a sound as of a rustle of silk upon the stairway, and Tina heard it, and knew it was Miss Bilkerson coming to demand an explanation. The girl's black eyes dilated like a child's, and she was paler than ever; but when she rose to her feet as the door opened, something in her face—a something new and sweet and brave—told Theobald that he had not lost his cause.

"I was not aware, Tina," said Miss Bilkerson, grandly, "that you were entertaining a visitor."

Tina stepped forward.

"This is Dr. Theobald, Miss Bilkerson," she said, "and—and he wishes to speak to you." And with one innocent speechful look at her lover, slipped out of the room.

He told her afterward what he had intended to tell her that day if he had not so broken down. How he had missed her from the nursery window; how he had thought of her almost unconsciously at first, and quite consciously after; how his memory of her had grown into his life, until he had begun to long for something more real; how he had failed to understand himself, until the truth had come upon him like a shock; how he had feared and wondered and theorized, until the sight of her as she walked among the pupils that day had struck him to the heart, and forced him to take the strange step of coming to her with no excuse but the one of his overwhelming love. And the end of it was that of course he won her. Indeed, the truth was that he had won her long ago, even before she ever guessed that her sad shy thoughts of him were more than reverently admiring ones. And when she was his wife, the wife of the great Dr. Theobald, and the beloved young mistress of the house she had regarded with such awe, the time came when she told him so.

THE JEWS AND THEIR PERSECUTORS.

By EUGENE LAWRENCE.

BORN amidst the Egyptian persecutions, stricken by the fires of Sinai, the Israelites begin their wanderings in the dawn of history, and have never known any long repose.¹ From age to age and from land to land they have been tossed and driven by their fellow-men from every place of rest. They glide amidst the throng of nations always the victims of a strange hostility. Yet they have outlived all their foes, and might well boast that the vengeance of Heaven had fallen upon their persecutors. The Pharaohs who chased them to the sea have been engulfed in the abyss of time. The cities and the shrines the Israelites helped to build sit in desolation by the side of the sacred river. Philistines and giants of Gath are no more. The Persian capital that preyed upon the Holy City, and Babylon that in its commercial prosperity enslaved all its neighbors, are lonely ruins. Rome next persecuted Salem. The bitterest days of the Jews were when the Temple lay a smouldering pile of ashes, and cruel laws banished them forever from the land whose very dust was dearer to them than gold. But the hand of fate smote Rome, and it perished like Dagon. Then came the Northern barbarians, and, with a half-savage Christianity, knelt in Jerusalem and cursed its gifted founders. Moslem followed Goth and Hun, worshiped at the shrine of David, and bore a less heavy hand toward his descendants. The Papal Church arose; all Christendom turned toward Jerusalem; and in the midst of feigned or fanatical contrition, began the fiercest persecution the Jews had ever known. From the time of the Crusades their sorrows deepened to the lowest abyss. No people ever knew, no family of man ever bore, such unmerited and such persistent woes. Fierce inquisitors in Spain, saintly kings in France, English monks and German burghers, fastened their maledictions on the hated race, and Christian people pursued the Jews with a furious rage that even Pharaoh or Nebuchadnezzar, Babylon or Persia, had never felt. No Jew was permitted to live in England, France, or Spain. His only refuge was the doubtful protection of the German emperor, a shelter in cities where the streets had often run red with Jewish blood, or a hovel in the Ghetto at Rome.

But at length that usurping Church which had taught the descendants of Goth and Hun the lesson of cruelty fell, with all its throng of ensanguined inquisitors, prelates,

kings, and nobles, before the light of a growing humanity. The Reformation came, and slowly the natural right of men to live on the same earth, unmolested by each other, was acknowledged. The harsher traits of the first reformers were amended by their disciples. The sixteenth century saw some improvement in the condition of the Jews. The succeeding centuries opened to them a home in all Protestant lands. They began to flourish with fresh vigor. Their cultivated scholars and acute merchants, their learning and their industry, raised them at once to a singular prosperity. Again they saw the hand of fate fall heavily upon their persecutors. Spain, the home of the Inquisition, sank into decay. France and England were torn by fierce revolutions that redounded to the future prosperity of the Jew. A fair republic sprang up in the New World, that was the first of all the nations to offer a peaceful and happy home to the persecuted people.¹ It was only within a few years that the last trace of its cruel legislation disappeared from the statutes of England. It is not long since that the Mortara was stolen from his weeping family, and was imprisoned in the convents at Rome. It was not till the pope fell before the indignation of Italy that the Jew was released from the Ghetto, and the long persecution that had begun with the rage of Pharaoh ended with the impotent maledictions of Pius IX.

Yet it is rather as intellectual agents moving among the nations that I propose to sketch the later history of the Jews. Like a long line of light reaching back to the dawn of human progress, their higher cultivation shines out through every age of darkness. Every where they held up before Greek and Roman, popes and crusaders, Gothic kings and mad inquisitors, the sacred table that had been given amidst the thunders of Sinai, and on which was engraved, in letters of fire, "Thou shalt not kill," "Thou shalt not steal." The law was the foundation of all Jewish morals, letters, philosophy, and on the front of the clouded mount had been written forever the first principles of human progress. It was to these that the Jews pointed the barbarous races by whom they were surrounded. Of every sect and every tribe, the schools of Gamaliel or of Shammai, rigid Karaite or fanciful Talmudist, all conspired to hold up before mankind one code of morals, and to raise as their standard that sacred law that has enlightened the conscience of all modern civiliza-

¹ Jost, *Geschichte der Israeliten*. Baasage, Juifa. Milman, *Hist. Jews*. Deutsch, *The Talmud*. The *letz talmud*, Deutsch relates, "is unknown to the Talmud." and the Jews have ever suffered without a thought of retaliation.

¹ Jost, *Geschichte*, 8. Thell, p. 26, notices the kind treatment of the Jews in all the American colonies and States. Sie kleiden sich, he says, with some surprise, völlig gleich mit den Einwohnern, etc.

tion.¹ Softened by a milder dispensation, it is yet the thunders of Sinai that startled Greek and Roman from their sensual apathy; that subdued the rude natures of the barbarians from the forests of Germany and Scandinavia; that echoed through the cathedrals of savage Europe, and are resounding in every Christian land. We write the law over every altar, and expand it in every code. It is passing over all the world, and is at the front of the highest civilization; and it is a Jewish rather than a Greek or Roman culture that has controlled the conduct of modern families and nations.

In one instance only have the Jews consented to change their habits of life, and in that we discover anew the marks of their perpetual suffering. From active and successful husbandmen and tillers of the soil they have been transformed into merchants and money-lenders.² They seem to have wholly lost that love for nature and that agricultural skill that made Palestine a land of plenty. In Babylonia and Persia, under a comparatively gentle rule, they were rather farmers than traders. Even late in the Roman period, and probably until near the sixth century, they were chiefly an agricultural people. The Talmud abounds in allusions to the cultivation of fields and gardens, of oil, wine, and wheat, fruit and flowers. Its nice and varied rules of conduct relate chiefly to the people of rural districts rather than of cities. When the great schools of Babylon and Pumbeditha were flourishing, and the vivid intellect of the Israelites was expanding into a literature of commentators and professors, the race was marked by an intense love for the Oriental lands they cultivated. But when the universal persecution fell upon them, when they were hunted from Babylonia and Persia, and began that remarkable series of wanderings from city to city, and from realm to realm, that has lasted for more than a thousand years, the manners of the race changed. They became a nation of traders.³ Industry, thrift, learning, and rare acuteness they never lost, but they were never again to become peaceful tillers of the soil. They were forced to snatch opportunities of gain from the midst of their wanderings. They became the most acute and untiring of traders. Their wares

and their profits were such as could be most easily handled and secured. They supplied the barbarous princes of Germany with the most costly drugs and spices of the East. They dealt in jewels that they could easily conceal or swallow, and in Oriental cloths that were of priceless value. They were the most active slave-traders of the Middle Ages, and the Church vainly heaped its maledictions on the Jew who should dare to purchase Christian slaves. Their capital in money probably grew from age to age.¹ They were the common money-lenders of the early period. The Jews seemed to have concentrated the wealth of the Middle Ages among themselves; they lent their money at an enormous interest and upon ample security; they accumulated immense fortunes, which they were obliged to hide from their persecutors in an aspect of extreme poverty. But their home was never again to be amidst the soft landscapes of Babylonia and Persia; and crowded together in a miserable Ghetto, living apart accursed and forsaken in the walled, fortified, and secure cities of Western Europe, they counted their secret gains, and sometimes displayed in their obscure dwellings a suspicious and Oriental splendor. Their daughters were clad in the rich silks of Persia, and shone with the gold and gems of the East.

It does not appear that the Jews ever ventured to show any resentment against their oppressors. From the beginning of their wanderings they bore patiently every outrage, and submitted with a strange resignation. Once only they were enabled to taste a momentary revenge. When Chosroes, the Persian king, on the decay of the Roman empire, invaded Palestine, the Jews sprang up in arms against their Christian tyrants, and aided in the siege of Jerusalem. The city fell, and the enraged Israelites rushed to the massacre of the Roman Christians. They purchased the captives of the Persian conqueror at a lavish price, and 40,000 Christian slaves, who might have been sold for large sums in the Persian cities, are said to have perished miserably at the hands of their pitiless owners. Avarice had yielded to revenge, and the Jews, who had so often been wasted and decimated by their Christian tyrants, now repaid their wrongs by an unnatural cruelty. For a moment they seemed to rule once more in their holy city. They pillaged the magnificent Christian temples that had been raised by Helena, desecrated and defiled the shrines of Calvary and the crucifixion, and perhaps leveled the sacred edifices to the ground. But their triumph was only for a moment. The Roman Emperor Heraclius soon after drove

² Jost, Offenes Sendschreiben an —, Streckfuss, Berlin, 1838, p. 41, explains the change. In ihren heimathlichen Gegenden, in Palästina, Syrien, Babylonien, Mesopotamien, bildeten die Juden . . . die Landbau und bürgerliche Gewerbe treiben mussten um sich zu ernähren, p. 41.

³ Jost, Sendschreiben, p. 41. Der ganze Talmud treats of Feldarbeit, Feldgeräthe, Wein- und Oelpressen, Fruchtverkauf, etc. Ich erinnere mich aber keines Gesetzes das darauf hinderten könnte, den Kaufmannstand als vorherrschend.

¹ Jost defends effectually (p. 48, Sendschreiben) the reputation of the Jews; and Macaulay, *Disabilities of the Jews*.

the Persians from Palestine, reduced the Jews to submission, and rebuilt or embellished anew the holy shrines with the last wealth of his decaying realm.¹

In all their earlier sufferings the Jews had never neglected their mental culture, and when the schools of Hillel and Shammai were driven from Jerusalem they sprang up again in the farther East. It was the boast of the Jews that all their children were educated, and that each of them had learned some useful trade.² While the Roman races were sinking into indolence, when all Europe fell into a barbarous ignorance, the Jewish schools of Babylon, Pumbeditha, and afterward of Egypt and of Spain,³ flourished in extraordinary renown. Their scholars of rare fame, their men of science, and their physicians, learned in all the highest cultivation of the Greeks, were perpetuated from age to age. Of all the European races alone the Jews never yielded to the barbarism of the Dark Ages, to the decay that fell upon the European mind, to the common degradation of mankind. Their intellects have remained clear and active, eager for knowledge, laborious in study, fertile in production, from the days when David sang, and Solomon taught a wisdom he had forgotten to practice. They were poets, musicians, scholars, thinkers, when the earth was thinly peopled by copper-colored races around the banks of the Euphrates and the Nile, when Europe was a savage and lonely wilderness, and its inhabitants, if it possessed any, hid in caves like wild beasts, or built like the beaver in the midst of lakes and stagnant pools. And as if to refute the notion that the intellect of any people must of necessity decline with years, that races have their seasons of progress and of decay, the Jew, whose ancestor guided the politics of Egypt and of Babylon, may be found equally active and valuable in modern states and nations.

There can be no plainer cause of this singular intellectual fertility than that the Jews founded their whole domestic life upon the general education of the people. In some instances, no doubt, poverty and extreme oppression reduced them to an ignorance not unequal to that of the savage Europeans. In the Ghettos of Rome and Germany, in the wilds of Poland, and on the shores of Hindostan, they produced no Gamaliels nor Hillels, no learned doctors nor acute priests, but wherever a momentary relief from suffering the most abject gave them an opportunity of mental culture, we find them at once founding their schools and colleges.⁴ For several centuries after the fall

of Jerusalem a shadowy and half-mythical kingdom of the Jews existed under the friendly shelter of Parthians or Persians on the plains of Mesopotamia. A prince of the house of David, a descendant, it was believed, of the royal race, ruled over a loyal people. The Jews submitted without a murmur to the various conquerors who overran the country in the neighborhood of the Euphrates; they opposed no invader, and took no share with any faction; they obeyed Parthian or Persian in turn. But the Prince of the Captivity, as was his title, exercised his regal powers over his own race with an authority not inferior to that of David or of Solomon, and the crown and the royal state seem to have been preserved until the last heir of the divine line disappeared, and the race had perished, it was supposed, forever. It was under the Princes of the Captivity, in the rich fields of Mesopotamia, that the most eminent of the Jewish schools arose. From Tiberias, where the learning of Jerusalem had found a refuge after the fall of the city, the teachers of the law were driven to the farther East. In the second and third centuries the schools of Babylon, of Pumbeditha, Surra, and other Eastern towns, attained a fame and an authority that extended over all the Jewish race. Scholars from all the Jewish colonies came to be educated in the lecture halls of the East; eminent doctors like R. Asche or R. Jehuda held a mental control over their countrymen that has had no parallel in European letters; all the great questions of the law and all the politics of Judaism were discussed and decided in the Eastern schools; their authority seems never to have been questioned; and at length their decisions, their casuistry, their nice conscientiousness, their bitter hatred for Christendom and the name of Christ, were condensed in that immense literary collection known as the Talmud.

Whatever was the natural bitterness of the Oriental school against its persecutors—and it is more than equaled in the acts as well as the words of Christian bishops and barbarous kings—its writings show a liberality that spoke of progress. The Talmud is an effort to accommodate the law of Moses to the varied circumstances of Jewish life,¹ and through all their pains and terrors of the Middle Ages the Jewish scholars found in its pages perpetual sources of consolation. To their oppressors the name of the learned volumes seemed terrible and mysterious. It was believed that the Jews were often magicians, and that their sacred books, hidden in a rude and dissonant language, contained

³ Lindo, *Jews in Spain*, gives a long series of eminent scholars.

⁴ Jost, *Geschichte*, iv. 272. Diese Akademie bildet zugleich den Obersten Gerichtshof der Babylonier.

Jost's history is filled with the long line of Jewish scholars, who seem, however, not to have been free from an irrational pride.

¹ Jost, *Geschichte*, v. p. 24. Die Mischna, abgesehen von der Eigenthümlichkeit ihres Verfassers, ist die Darstellung der Art und Weise, etc.

secrets that might prove of fatal import to Christian men and women, that they taught how to transmute dross to gold, the arcana of demonology, and the command over evil spirits. Nor were the ignorant Christians altogether mistaken. The Talmud founded schools and perpetuated education. It was a source of intellectual life to the Jewish doctors, who carried their rare learning to the court of the caliphs of Bagdad, and to the Spanish colleges, from whence Gerbert borrowed the elements of science. It is, indeed, quite impossible to limit the amount of the influence of the Talmudical writings upon the early culture of Europe. Their aphorisms and parables, responses and questions, their interesting legends and startling mysteries, their constant encouragement to intellectual labor and the cultivation of the finer faculties, must have had no small share in keeping alive the mental powers of the West, where Christian barons could not write their names, and Christian priests could scarcely spell out their breviaries. It is not difficult to believe that learned Jews were the first to found medical schools in Italy, colleges in Spain, and Hebrew lecture-rooms at Oxford; and the world has yet to learn how much it owes to the students of the Talmud.¹

A schism, however, followed the general reception of the Babylonian Talmud and the rapid spread of rabbinism. The sect of the Karaites, the strict followers of the law, who admit no comments, and consent to no novelties, began at an early period their struggle against innovation. Often severe in morals, always rigid in forms, the Karaites read in their synagogues only the teachings of Moses and the prophets, and would be bound by none of the popular speculations of the Babylonian school. They separated with stern disapproval from their erring brethren, and the two Jewish sects were divided by an animosity not inferior to that which had severed the Arian and the Catholic. But the schism of the Karaites has had but little prosperity. It has produced some eminent intellects and some profound scholars. But its numbers have decreased, and its influence is in a measure lost. In a half-ruined city of the Crimea, still the chief seat of the Karaites, may be found the lingering remnants of a devoted race, who point to the inscriptions in their crowded and ancient cemetery as the proofs of their former greatness, and who still refuse to hold friendly intercourse with the disciples of the philosophical school.

The fate of the wandering Israelites among the Western nations was varied by a con-

stant succession of adverse or of prosperous epochs. Under the rule of their Semitic relatives, the Saracens and Mohammedans, they were often treated with a marked toleration.¹ Jewish scholars were welcomed and prized at the court of Haroun-al-Raschid, and were received with equal favor in the Moslem cities of Spain. Even Charlemagne, when planting anew his system of education in the barbarous realms of Germany and France, seems to have suffered them to live unmolested in his dominions, and sent Isaac the Jew as one of his ambassadors to the Caliph of Bagdad. It was this famous mission that was supposed to have obtained for the German emperor a certain sovereignty over the holy places of Jerusalem, and that certainly brought back to him from Bagdad some curious presents—an immense elephant that was long the wonder of Germany, an organ, and a collection of apes—and, what was of more importance, conveyed to the German schools a knowledge of the progress of the East. But it is sufficient for our purpose to know that in the opening of the ninth century the Jews were still a conspicuous people, noted in the three great centres of dawning civilization for their energy and mental vigor, and that no trace of decay had yet subdued the adventurous spirit of the children of Israel. Their close relatives, the dark-complexioned, impulsive, industrious throngs of Assyria and Tyre, of Sidon and Carthage, had perished from the face of the earth. The Semitic race was now represented by the Jews and the Arabs. And it is probable that a large share of the mental progress that was to illustrate the later period of the Arabian conquerors in the East and West was due to the teachings of Jewish rabbins, that the example of the Hebrew colleges and schools may have inspired with a love of knowledge their savage relatives, who had sprung from their native deserts to follow the heroes of the Crescent.

It is, indeed, one of the rare peculiarities of the Jewish race that, unlike all its Semitic allies, it flourishes in every climate, and is as vigorous and as prolific in the frosty North or the American wilderness as it was amidst the soft landscapes of Granada or on the hot plains of Mesopotamia. No Arab ever founded a colony far from the tropics. The Phœnicians and Carthaginians have left no trace of their settlements on the shores of Cornwall, or even of France. The tropical races have seemed incapable of expansion beyond their own torrid region. But the Jews from an early period not only wandered to the extreme North, but settled in lands where the perpetual frosts and chilling mists must have proved repulsive and apparently fatal to the offspring of the gentle

¹ Deutsch, Talmud. The reverence paid to learned doctors was sometimes excessive; yet they were often weavers, tanners, tent-makers, and maintained themselves by some useful trade. "Work," Deutsch tells us, "was honored among the Jews."

¹ Milman places the golden age of the Jews under the rule of the caliphs.

South. They are found in Germany under Charlemagne; they multiplied in England under Edward the Confessor and the Norman kings; they made up a large part of the population of Paris when Philip Augustus persecuted them; they have flourished in Poland, and thriven under the shelter of the czars; and it may be a not unnatural inference from their history that a regular and rational system of mental cultivation, joined with industry and moral restraint, is of more influence upon the perpetuation of races than the triumphs of Cæsar and the glories of Cyrus and Alexander; that the cultivated man flourishes in every clime, and the educated race conquers the apparent limitations of nature.

From the friendly shelter of the Moslem caliphates and their native East the Jews, apparently possessed by a strong taste for wandering, or an insatiable love of gain, planted their unsteady colonies in all the Western nations, and sought humbly a hospitality that was never shown. Every where they were received with aversion and disgust. The dark-skinned and alien race, speaking an Oriental language that no European could master, and governed by customs of neatness and propriety that seemed to Goth and Hun an excess of fastidiousness, unwarlike, and highly educated, were met every where by an unvarying cruelty and scorn. In Germany they were reduced to a peculiar form of slavery. A Jew was not a person, but a thing, a chattel, and a waif.¹ The emperor took possession of the Oriental strangers as his own peculiar heritage. They were his bondmen. He protected them when he was able, and plundered them when he wanted money. Yet they soon grew numerous and wealthy in the cities along the Rhine, and aroused the envy of their Christian neighbors by an opulence which they sometimes incautiously displayed.² They were forced, or probably preferred, to live apart in a quarter of the city by themselves. They founded their synagogues and built their school-houses amidst ceaseless dangers. The ignorant priests followed them with maledictions, and the still more ignorant populace pelted them with stones, and beat and pummeled them at will. Accomplished and gifted rabbins were often looked upon as magicians. The Jews' quarter seemed to the barbarous Germans a centre of mysterious and fearful deeds. It was believed that the Jews were in the habit of stealing the Host from the altar in order to mock once more at the crucifixion with secret rites, or that they enticed away Christian children to

stab them with sharp knives and sacrifice them in a frightful ceremony. When a child strayed away in the German or Italian cities, the Christian mother at once fancied that it had been lured into the Jewish quarter to be put to death. The Jews were all supposed to be acquainted with magic, and capable of weaving dark spells that brought disease and decay, misfortune and shame, to Christian households.¹ Yet they were wonderfully prosperous, and might have outlived their early unpopularity had not a sudden wave of religious fanaticism swept away what little humanity and intelligence had yet sprung up among the European nations. The preaching of the Crusades turned back the course of human progress for three hundred years. The passion for bloodshed and for barbarous cruelty revived under the fanatical eloquence of popes and prelates. The Roman Church taught that it was no crime to kill a heretic or an infidel, and it had never paused to exclude the Jew from its inhuman inculcations. "Thou shalt not kill," "Thou shalt not steal," were erased from the Decalogue, and the wild and cruel throngs, dissolute and infamous, that gathered under the banners of the Cross made their first essays in robbery and bloodshed among the wealthy and cultivated Jewish colonies on the banks of the Moselle and the Rhine. They burst into the Jewish quarters; they sacked the rich houses, and drove their wretched inmates to suicide and death. Fair women stabbed themselves in Mentz and Treves. Husbands first killed their wives, and then themselves. The Rhine floated thick with the corpses of murdered Jews. Rich with spoil and drunken with license, the Crusaders swept on, carrying devastation to all the Jewish settlements through which they passed in Hungary and in Austria, and at last perished themselves in countless numbers, in unutterable torments of thirst and hunger, disease, labor, by the darts of the Saracens, and the hatred of mankind. Nor was the second army, under Baldwin, the chivalry of the age, more merciful. When Jerusalem fell they massacred all the Jews—men, women, and children—whom they found in the city, and with tears of joy knelt before the Holy Sepulchre. Yet they might have heard, in the lull of their fanaticism, the thunders of Sinai, and their own condemnation uttered from the flaming mount.

From this period (1100) history is laden with the cries of the Oriental wanderers for

¹ Jost, Sendschreiben.

² Basnage, xiv. xv. xvi. p. 657, describes and ridicules the stories of Jews sacrificing children, etc. Milman seems sometimes to doubt. Je suis l'historien des Juifs, etc., says Basnage. Je ne crois pas tout.... le meurtre des enfans.

¹ *Fortalicium Fidel contra Judeos*, a monkish production written toward the close of the fifteenth century, enumerates the crimes laid to the charge of the Jews, lib. iii. p. 143. In regno Francia occiduntur infantes per Judeos. It tells how the corpse of a murdered girl at Cologne pointed out her Jewish murderers, and how they stabbed themselves. No miracles would convert them. They laughed at the bleeding images and winking pictures, etc.

mercy from the persecutors of the West. England was the first of the Western nations to drive them wholly from its borders. They had reached the shores of the misty island during the rule of the Saxon kings, had thriven amidst the constant warfare of its barbarous races, had been tolerated by the humane Alfred, and favored by the Norman William. Henry II. had granted them his royal protection, and profited by their industry.¹ They seem to have lived in fine houses in the older parts of London. At York they were numerous and wealthy; at Oxford they had even established three Hebrew halls or lecture-rooms. A bishop complained of the splendor of their synagogues, and their wealth and prosperity attracted the envy of the less prudent Christians.² Their debtors were found in every city; their pawns and pledges had increased year by year; they had often paid enormous assessments, and had borne patiently burdens that must have brought bankruptcy to the whole Christian community. The immense wealth of this industrious race is proved by a long series of exactions that were met with ease, and of various disabilities that did not interrupt their course of accumulation. In Old Jewry, London, some traces of Jewish opulence have been discovered—some inscriptions on stone that point to a crowded and well-built quarter. It is probable that the chief financial affairs of England were transacted by the dark-hued strangers, who had their stone mansions and secret warehouses around Old Jewry, and their cemetery at Cripplegate, and whose keen capacity for trade must have had no small share in founding the commercial greatness of London. Thus might the Jews have enjoyed an interval of beneficial rest under the rude protection of the Norman chiefs, had not a sudden outbreak of popular fanaticism, envy, and rage destroyed in a moment all their felicity.

Westminster Hall and all its ancient environs were thronged with the chivalry and the populace of England when Richard the Lion-hearted was about to take the coronation oath in the presence of his turbulent and barbarous subjects.³ All the people were summoned to witness the spectacle; but the Jews alone, by a special exception, were forbidden to enter the sacred precinct. It was feared that by spells and sorcery they might bring mischief to the cruel Richard. Some of them, however, strangers perhaps, who were unacquainted with the usages of

the time, ventured to mingle with the throng. They hoped to remain undiscovered. They may have thought it their duty to assist at the coronation of the valiant king. But one of them was recognized by a Christian neighbor. The Christian, enraged, ordered him to leave the place, and when he refused, struck him a heavy blow. The populace joined in the assault in the very presence of the king, and the unhappy Jew fell dying beneath their inhuman rage. They next chased the Jews whom they found in the Abbey or its neighborhood, with fierce imprecations, along the devious roads that led from Westminster to the Hebrew quarter. The Jews took refuge in their houses. The people, now stimulated by the hope of plunder, broke into the fair mansions around Jewin Street or Gresham, sacked the rich quarter laden with the gold and jewels, the fine robes and rich wares, of the successful traders, inflicted terrible outrages, spared neither sex nor age, and at length set the Jewish houses on fire. All night the flames blazed over medieval London, threatening the destruction of the city. Richard in vain sent his Chancellor (Glanville) and a troop of horsemen to suppress the tumult. The savage populace pursued their work of robbery and death unmolested. In their rage they even burned or sacked the houses of their fellow-Christians. When there was nothing left to plunder or destroy, they ceased from their dreadful labors. Some of the Jews had found a shelter in the Tower or in the houses of Christian neighbors less savage than the rest of their countrymen. Some were saved by Glanville. But even the lion-hearted Richard did not dare to punish their persecutors. The news of the massacre and robbery at London spread through England. It incited every where the wild people to similar outrages. At Oxford, at York, and wherever the Jews had amassed wealth and attracted notice, they were maltreated, robbed, and massacred with hideous malice.¹ Yet they were apparently soon restored to something of their former prosperity, and Richard having laid on them a heavy tax to pay the expenses of his crusade, set out to rescue Jerusalem from the avenging arms of Saladin.

Wherever the Jews settled, it is the boast of their historian, they strove to perform their duty as subjects, to obey the laws, to become attached to the country, and to remain no alien race. They were Englishmen in England, Frenchmen in France. They formed a natural fondness for the land in which they lived, and clung with a strong affection to their homes amidst the cruel English, or in the dangerous precincts of the

¹ Jost, *Geschichte*. The Jews seem to have come over in large numbers with William the Conqueror. Jost thinks they were first tempted to England by the slave-trade. See *Anglia Judaica*.

² The *Liber Albus* tells us that no house in London could be let to a Jew except it was in their own quarter.

³ Jost, 1189. All the monkish chronicles relate the frequent persecutions of the Jews in England.

¹ Jost, *Geschichte*, 1189. In the Oxford schools not only Jews, but any student, might acquire Hebrew. Nicht allein Juden sondern auch Studirende, etc.

German cities. It might well be supposed that the massacre at London and the fearful scenes at York would have frightened them from the land that seemed the abode alone of robbers and malefactors. But they still lingered amidst their foes. King John, when he ascended the throne, treated them with a suspicious gentleness;¹ he even called them his dear friends and brethren; he lulled them into a fancied security. But he soon imposed upon them such severe exactions as must have wasted all their gains, and when an opulent Jew refused to pay his demands, ordered his teeth to be drawn out one by one until he yielded. The Jew lost seven teeth before he paid the contribution. Torture and torment, robbery and scorn, were the common traits of Jewish life under John. His successors, Henry and Edward I., were no more lenient, or were unable to restrain the hatred of their people. At last, in 1290, the chivalric Edward, without warning, and for no known offense, ordered every Jew to leave England forever. The hated race were no longer to be suffered to live in a land whose prosperity they had enlarged, and where they had first planted commerce and refinement. Their fine houses in London and York were seized by their persecutors; their synagogues were given to the Church; part of their rare collection of Oriental literature enlarged the library at Oxford.² The king seems to have been willing to suffer them at least to depart in peace; but the people followed them with incessant persecutions. A large number of Jews had gathered on the banks of the Thames, below London, before setting sail in a ship in which they had engaged their passage. The tide was rising around them; the master of the vessel, who had persuaded them to land on the shore, with scoffs and cruel mockeries now refused to take them in. The water rose, and the unhappy Israelites sank forever in the turbid Thames.³ It is said that the master was afterward punished for his crime; yet the cries of the perishing Jews seem still to sound over the dark waters of the pitiless river.

Nearly four centuries passed away, and still no Jew had ventured to enter the forbidden land. At last, when Cromwell became ruler of England, a remarkable assembly gathered at Whitehall by order of the Protector, to discuss the question whether the Jews should once more be allowed to settle and trade unmolested in England.⁴ The Rabbi Manassas, followed by a number

of Jewish merchants, had come to London with a petition that the unnatural restriction should be taken from his race. The Jews asked for the same toleration which they already enjoyed in Holland and Poland, and offered, it is said, £200,000, an immense sum at that period, for the privilege of trade. Cromwell, surrounded by Puritan preachers, eminent lawyers, the Lord Mayor of London, and his chief counselors, proposed the question to the assembly at Whitehall. He was anxious, it is said, to accept the offer of the Jews, but his council did not adopt his opinion. The Jewish merchants went away disappointed, and it was not perhaps until after the Restoration that the Jews began timidly to return to the land from which they had been driven four centuries before. They still labored under many disabilities.¹ The Church and the people looked upon them with dislike. The magic pen of Shakspeare had drawn from the realm of fiction the portrait of a Jew that must remain as immortal as it is untrue.² Yet the Oriental strangers slowly won their way to a respect that was at length freely awarded them. Their legal disabilities were gradually removed. They became eminent in every commercial enterprise. They aided once more in building up the financial supremacy of England. The example of the American republic, where the Jews had always been welcomed with a perfect equality of rights, and where they had always ranked with the most patriotic and useful of our citizens, was not without its influence upon English thought. The last disability was removed from the Jew in England within a few years. After a violent opposition from Churchmen and Tories, after a brilliant defense of the Jewish race from its latest persecutors by Macaulay,³ by the united strength of the whole Liberal party, the Jews were admitted to all public offices and to Parliament. They share in the government of the land from which they were banished for four centuries, and have triumphed over all their opponents. Nor is it the least remarkable trait of their varied history that one of their race now rules England as the head of that Conservative faction which was the last to persecute them, with an intellectual acuteness and versatility that recall the keen dialectics of the Talmud, with a sharp and glittering logic, with a delicate yet remorseless sarcasm, that

¹ In 1758 they obtained citizenship through much opposition. See "A Candid and Impartial Examination," etc., 1758, p. 10, 11, 19.

² The story of Shylock, it seems, had long been familiar to the Jews before Shakspeare's time, except that in their narrative Shylock was a Christian.

³ Macaulay's *Essays*, The Disabilities of the Jews. Even in 1830 Macaulay was obliged to rebuke severely the uncharitableness of Christians.

⁴ The magnanimity or the inconsistency of Mr. Disraeli must be admired, since he is now the chief upholder of that Church and that party which were longest the foes of Israel.

¹ Milman, iii.

² Jost, vii. p. 171. Many of the books were sold, and probably still more destroyed. Yet the English Jews, says Jost, produced few eminent scholars.

³ *Jews' Advocate*, 1758, p. 27. The story is told by Coke.

⁴ *Harleian Miscellany*, vii. p. 576-578. Many Jewish merchants, the narrative relates, had come from beyond the seas to London. They went away grieved.

might have been hailed with boundless applause in the casuistical discussions of the Babylonian schools.

The story of the Jews in France represents a far higher degree of mental and material prosperity than they had attained in England, and a still more lamentable fall. They were welcomed apparently by bishops and statesmen in the sixth century to the French cities. They must have exercised a valuable influence on the civilization of the Frankish invaders. Through varied scenes of persecution and of progress, they rose gradually to form a numerous and important part of the French population.¹ In the south of France they attained an ease and an opulence that were equaled in no other land. The dark-skinned, gifted, and active Orientals found no prejudice of race or of faith to disturb their tranquillity in the fair cities that had been touched by the refinements of Greece, and that gave birth to the songs of the Troubadours. It is indeed a somewhat striking trait in their history that their chief persecutor in all their wanderings was the Papal Church, and that by all other Christian sects they were treated with comparative favor, and looked upon with no ordinary interest as the descendants of the chief authors of the modern faith. The Arian kings, and apparently the Arian priests, in Italy, Spain, and Egypt, had extended to them a liberal protection. Charlemagne, who was never orthodox, had favored them. Among the Albigensian cities of the south of France it was no discredit to belong to the race that had produced the psalms of David and the canticles of Solomon. In Marseilles, Montpellier, Nîmes, and Béziers, the Jews flourished as merchants, manufacturers, philosophers, and poets. Wealth came in upon them, as it did in every other region, as the natural product of careful industry; and knowledge, which they often prized more than wealth, they attained in equal measure. Schools and libraries, cultivated rabbins and learned physicians, rival sects of science and philosophy, diligent students of the Talmud and the law, illustrate the brief period of repose which the Oriental strangers found amidst the fair landscapes of Provence, before the papal decree rained down war, famine, ruin, on the sunny clime.

They were scarcely less fortunate in the north of France. The Paris of the Middle Ages, we are told, was almost a Jewish city. The dawn of its magnificence was due to Jewish capitalists. Their wealth adorned its narrow streets with fine mansions, and cultivated its environs into groves and gardens.² Amidst wars and insurrections, violence and disorder, the Jews alone industriously culti-

vated the arts of peace, exposed to the rude and savage race around them the height of Oriental culture, and were the benefactors of an age that was scarcely able to perceive it. Painful is it indeed to look back over the long waste of history to this learned, imaginative, and ingenious people, building their fair palaces in mediæval Paris, amassing their immense riches by all the resources of trade, holding, it is said, nearly half the city as security for their loans, as the foundation of their unsubstantial prosperity, founding their schools, producing an illustrious line of scholars rather than warriors, engaging in brilliant controversy and intellectual disputes that held all the nation enchained, careless of danger in their fabulous luxury, while above them hung the sword of Damocles, and a dreadful ruin threatened them every moment. Nowhere did the disputes of the Jewish schools rage more fiercely than in the French cities.¹ The wars of the rabbins were confined, however, to the limits of the Talmud. They seem to have avoided all controversy with their Catholic neighbors. Yet an intellectual pride, of all others, perhaps, the least rational, was not unfrequently the common error of the Jews. Knowledge did not always teach them moderation. Nor could they avoid a sneer, a smile, or a jest at the cruel and sensual monks, who boasted of their miracles and confessed their own ignorance, or the brutal and deluded kings and nobles who came to borrow money on their rich possessions, and waste it in the service of a thankless Church. Among the bigoted Catholics of the north of France the Jews had never received more than an ungracious toleration. Paris had never welcomed them with the freedom from prejudice of Montpellier and Marseilles. They were always hated, envied, and condemned. The monks told fearful tales of Jewish cruelty to Christian children. The nobles lamented over the rich lands they had pledged to Jewish usurers, and the kings preyed upon the helpless strangers, who had no shelter but in the royal authority. Yet the Jews, trusting, perhaps, to their own acuteness, their wealth, their knowledge, their mental and moral superiority over the barbarous Franks, still in a singular infatuation went on increasing their large landed possessions, extending their loans, aiding with their capital the progress of trade, tempting the avarice and enraging the superstitions of their masters by the display of a prosperity that seemed to overshadow that of the Bourbons or the Montmorencys.

Their fall was near. It was not long before all their opulence was to be torn from them, their schools closed, their libraries dispersed, and every Jew chased by monks and princes from the realm of France.² The

² Id., viii. 28, 287.

spirit of the age had changed. A darker fanaticism had fallen upon men's minds. Every knight or warrior who came back from the holy war had been educated to deeds of bloodshed and a bitter hatred against the unoffending Jews. Nor could priests or princes any more consent to spare the alien people who had made France wealthy and Paris great. Philip Augustus, the Pharaoh of their last great disaster, first robbed them of their property and then drove them from his kingdom. In the midst of their wide system of productive loans and liberal credit, when their mortgages embraced half Paris, and their houses were filled with pledges and pawns, a royal edict confiscated all their debts, and freed every Christian from his liability to a Jew. Astonished at this royal robbery, the unlucky traders were soon to feel a more fatal blow. An edict had been secretly prepared for their complete expulsion and the seizure of all their property. On a fatal Sabbath, when all the Jews were gathered in their synagogues at Paris, the officers of the king surrounded the sacred buildings and imprisoned all the worshipers. No one was allowed to go out. Meantime a general sack of all the Jewish houses had begun, and the wealth they had painfully accumulated through centuries of toil was stolen by priests and king. They were then driven out of France. An immense emigration took place. Like the Huguenots, they bore with them the honesty and the industry of the nation; and in their fanciful and Oriental manner they were accustomed to lament that in this fourth and chief of their great disasters twice as many people had fled from France as had escaped from the arm of Pharaoh and witnessed his destruction. But no pillar of cloud and fire now sheltered the children of Israel from the rage of their persecutors, and no rushing waves avenged the sorrows of the chosen people.

Some retribution, however, must have soon followed, for it was found that the trade and commerce of France had suffered greatly by their absence, and a new prince invited them back. They paid a large sum for the dangerous privilege, and once more filled some of the fairest streets in Paris. They once more lived in the Rue des Lombards, or des Jardins, and opened their synagogues under the shadow of St. Geneviève. But in 1226 St. Louis ascended the throne, of all his corrupt race the most bigoted, the most cruel, the most faithless, and the most infamous, the last of the Crusaders, and the last to summon Christian barbarians to the warfare of the Cross. The Jews soon felt the rage of the tyrant. In

1238 they were robbed and massacred in Paris. St. Louis plundered them to pay the cost of his crusades. To destroy their dangerous intelligence he ordered the destruction of all their libraries, and twenty-four cart-loads of valuable manuscripts were committed to the flames. They were again driven out of France. They came back once more with a strange infatuation, and again paid an immense sum to soften the rage and satisfy the avarice of monks and nobles. Paris and France flourished anew under their intelligent industry. Again they were banished in 1395, never to return with perfect freedom until nobles, priests, and king had perished amidst the convulsions of that final revolution by which France itself avenged their persecutions, and opened the way to that stormy era which must end at last in the regeneration of a nation that has suffered perhaps not in vain.

Yet it was in Spain that the Jews were to reach the culmination of their intellectual and material splendor, and to astonish mankind by the magnitude of their misfortunes.¹ To Spain they may have first wandered when Solomon sent out his fleets to Tarshish, and when silver was so plentiful at Jerusalem as almost to lose its value.² They were probably in Spain when the Romans covered it with costly cities, roads, and bridges. They were tolerated by its Gothic sovereigns of the Arian faith, persecuted by the Catholic. But when the Mohammedans spread over the Peninsula in the reigns of the cultivated caliphs, the Jews rose into a great nation, and were numbered by millions. Their wealth eclipsed that of all other nations. Their capitalists at Granada and Seville were famous for an opulence that outshone all that the world had ever seen. Factories and mines, broad lands, and streets of houses were held by their commercial nobility. They built synagogues of priceless cost. They founded libraries, and endowed colleges that filled Europe with intelligence. Their physicians were sent for to heal the maladies of European kings. Their treatises on science, medicine, mathematics, and philosophy founded the schools of modern thought. For four centuries the Jews of Spain held an unquestioned mental ascendancy over the barbarous Europeans, and kept alive the regular progress of refinement.³ Education was the shining trait of Moorish civilization, and the Jewish scholars of the Peninsula probably guided their Semitic relatives to the love of knowledge. But in the fierce wars between Moors and Spaniards, when city after city fell, wasted and ruined, into the power of Catholic kings, the splendors of Jewish cultivation were

shorn away by barbarous lords, and at last all Spain fell, bleeding and ruined, under the rule of the relentless priests. The Inquisition was founded. To rob and to torture were the chief aims of this priestly institution. The goods of the infidel, the heretic, or the Jew were first confiscated to the Church, and his life was next ravished away in unspeakable torments. Instead of schools and colleges were found palaces of human woe, where fierce Dominicans lived in boundless luxury, and where the wisest and purest of their species often suffered torture and death at the hands of the most infamous and the most degraded. Knowledge and virtue perished at their approach, and Spain sank into an almost irrevocable decay.

The Jews were the favorite victims of the Inquisition. When history shall cease to be as unreal as a fairy tale, and when crime shall no longer find its defenders, it will be related that "the gentle and virtuous" Isabella inflicted heavier woes upon the human race than Messalina or Mary Tudor.¹ In 1492, in the dawn of a new civilization that was to overthrow at last the dark places of cruelty, and crush popes and inquisitors in a general uprising of the nation, Isabella, the foundress of the Spanish Inquisition, urged the expulsion of the Jews from Spain. No pity had she for the mothers who were to be torn from their prosperous homes to perish of hunger and thirst on the African shores, who were to leap into the blue Mediterranean to escape the insults of their captors, to see their babes die in their arms, their children sold into a fatal slavery; no compassion for the throng of learned and famous men who were to founder in crowded ships or languish with disease and starvation in a foreign land.² It is not told that the bigoted queen ever felt any remorse for her cruel deeds, or was ever willing to soften the woes she had inflicted needlessly on the most valuable portion of her subjects. At the famous meeting when Abarbanel, the most eminent of the Jews for scholarship and virtue, begged on his knees for pity for his people from the attentive sovereigns, when he offered an immense ransom for their preservation, when even Ferdinand hesitated, it was the queen who urged the relentless enforcement of the decree, and the stern Torquemada flung on the table a crucifix. "Sell him if you will," he cried, and terrified the king into obedience to the voice of the Church. The decree was published, and every Jew commanded to embrace Christianity or leave the realm.

Unshaken in their faith by the rage of

tyrants or the malice of the people, the Israelites prepared to abandon forever their luxurious homes, their lands, and their rich possessions, and go forth once more to some distant and unknown refuge.¹ During the short time allowed them for their departure the roads of Spain were filled with the emigrant throng hastening to the coast to seek a passage over the sea. They had sold their property for whatever they could obtain for it; they were permitted to carry no gold nor silver with them; but many hid money in their clothes, which was often stolen from them by prying inquisitors; some had even swallowed coins of gold. The misery of the wandering throngs, of mothers bearing their infants in their arms, of starving children and the feeble and the aged, sometimes touched the pity of their foes, and generous Christians ventured to offer them shelter or refreshment. The Jews were connected by intermarriage with the noblest families of Spain, and the great estates of its fierce hidalgos had often sprung from the dower of a Hebrew heiress. These ties were now sundered forever. At the sea-ports there were scarcely ships enough to bear away so great a multitude. It is variously estimated that from two to eight hundred thousand Jews were banished by the fatal edict. What woes they bore in their flight, how they were crowded in comfortless vessels, racked by disease, famine, pain, what insults they received, what outrages they endured, history almost refuses to relate. Nor is it possible that any large proportion of the exiles survived the dreadful flight. Many were seized by the Arabs and sold into slavery in the harems of Cairo and Constantinople. Many killed themselves in despair. But the fate of Abarbanel is less painful. He embarked at Carthage with his family and the remains of his property, and found a refuge in Naples. But soon Charles VIII. invaded Italy. Abarbanel fled to Messina, and heard that his house at Naples had been sacked by the French. He was so fortunate, however, as to recover the manuscript of a commentary which he had long been composing on the Jewish law. He found an obscure retreat, and closed his life in the pursuit of those studies which in a happier period he had hopefully begun.²

In the unparalleled sorrows of their expulsion from Spain the great disasters of the Israelites came to an end. From that period they have slowly advanced to a new and lasting prosperity. The most striking result of the Reformation, we are assured by their historian, is the change of feeling that has passed over all Christendom toward the Jews. The light of that knowledge which

¹ Mr. Prescott admits the dark stain on the queen's character.

² Jost, 7. Theil. Lindo. Prescott excuses Isabella on the plea that she was intimidated by the priests; but in founding the Inquisition she had already shown her true disposition.

² Jost, vii. 96, calls him Don Isaak Abarbanel ein gelehrter Jude—schiffte sich mit mehreren.

they had so sedulously kept alive through all the darkest periods of European history has at last dispelled many prejudices, softened many rude and savage races, and cultivated the sentiment of a common humanity. Men are less cruel, less selfish, farther removed from the vices of isolated barbarism, than they were four centuries ago. In no Christian land, except, perhaps, in some savage district of Roumania, are the chosen people followed by maledictions and cruel massacres.¹ The reformers, indeed, of every age have studied and emulated the examples of Moses and the prophets. It was to chant the psalms of David that the Huguenots fled to the deserts, that the Covenanters gathered on the bleak moors of Scotland. It was to enforce the spirit of the Decalogue that the Puritans wandered to New England. It was with the sword of Gideon that Holland met the armies of the Inquisition, and Cromwell won the liberties of Englishmen. The influence of Jewish thought is perceptible in all modern literature. With Hebraic imagery and an Oriental cast of language Milton wove into the chief of epic poems the Mosaic pictures of the fall of man. Addison and Marvel emulated the songs of David, and Pope aspired to versify the inspired visions of Isaiah. The two diverging streams of classical and of Oriental literature have blended together in the modern, and the higher conceptions of the Jewish thinkers have animated the colder taste of Western writers, have given novelty and strength to a literary culture that might otherwise have ended in a dull imitation of classic models.

Yet it must not be supposed that the Jews sprang in a moment from their depression and persecutions to a general ease and favor, or that even in the centres of the Reformation they were not without many disabilities and many pains.² Holland almost at the opening of its national existence offered them a secure shelter and privileges such as they had never ventured to dream of. But in many German states they were treated, even so late as 1830, with a disdainful toleration that marked the slow decay of ancient prejudices. In Protestant Frankfort they were still inclosed in their own quarter, and oppressed by ignominious laws. In Württemberg they formed a distinct and subject caste. The Emperor Nicholas banished many learned rabbins from Russia; and in London Jews were strictly excluded from

all public offices. Many of its houses and shops by the provisions of their leases could not be let to Jews; and when it was proposed to remove all their disabilities, the English press and Parliament rang with as rude abuse of the chosen people as they had borne in the days of Richard the Lion-hearted. It was urged that the Jews were aliens and strangers; that they had merited all their woes; that it would be impious to suffer them to sit in Parliament; that the act of their elevation to the rights of men had with monstrous indecency been brought forward in Passion-week. And Macaulay, with brilliant sentences and animated logic, replied that on no other day so well as on Good-Friday could the law of universal charity be proclaimed. In the mean time the example of the United States³ shamed Europe and England into humanity. The friends of freedom every where assumed the defense of the Jews. The conservative faction in church and state was every where their bitterest foe. Ten times the Liberal party in the British House of Commons by great majorities carried a bill for their enfranchisement, and ten times it was thrown out in the House of Lords.⁴ The Bishop of Oxford declared that he would never suffer an enemy of the Christian faith to sit in Parliament, and Lord Derby and Sir Robert Inglis repeated the bigoted outcry. At last, in 1858, the contest ended by a species of compromise, and a Rothschild entered the legislature that for more than six centuries had never ceased to persecute his race.⁵

In the same year that the Jews attained their final victory in England, the Papal Church was permitted to exercise its last act of bigotry and cruel oppression toward the race that had so often felt its unsparing hand. Restored by the arms of France to his temporal throne, the pope had revived the Inquisition in the Papal States, and ruled with a relentless tyranny over his hopeless subjects. The priestly courts of the narrow realm had begun once more to punish heresy with something of their early severity. The city of Rome, isolated from the course of modern civilization, strove to revive the principles and the practices of the darkest periods of its history. And the protection of imperial France, the sole support of the usurping Church, seemed to lend to Pius IX. an authority that none of his predecessors had enjoyed for centuries. Rome once more menaced Christendom with its claim of infallibility, its assumption of unlimited supremacy. The pope and the Jesuits openly boasted that the Papal Church had lost none

¹ Roumania has at last taken measures to relieve the Jews.

² In 1783, when it was proposed to naturalize Jews in England, their opponents asserted that it was an interference with the judgments of God; that it was wonderful that any Jew was permitted to live on the face of the earth, etc. See "A Candid and Impartial Examination," London, 1783, p. 10, 11. They had, however, their defenders. They were noted for their liberality even to Christian charities.

³ In Catholic Maryland alone, Jost tells us, x. 2, 224, were the Jews excluded from office.

⁴ Annual Register, 1858, p. 158. Lord John Russell led the defense of the Jews. The Conservative lords threw out the bills.

⁵ Annual Register, 1858, p. 160.

of its prerogatives in the past, nor would part with any of its extreme usurpations in the future. One of these inherent privileges was the right to take from heretical or Jewish parents those of their children who had been baptized in the papal faith, and educate them under the care of priestly guardians. It was a claim founded upon the decisions of those barbarous councils by whose authority the Jews had been tortured or banished in Spain, the Protestants burned or buried alive in the Netherlands, and Europe covered with the disasters of endless religious wars. It was in the midst of the light of the nineteenth century that the pope and his advisers resolved to renew a practice that must have shocked the humanity of any age. To rob parents of their children was the strange privilege asserted and enforced by the Roman Inquisition.

A reputable Jewish family named Mortara lived happily at Bologna in the year 1858, of which the father was a successful manufacturer, and connected by a close relationship with many of the wealthier inhabitants of the place.¹ One night he came late to his home, and, to his surprise and alarm, found it in possession of eight or ten servants of the Inquisition. They demanded, in the name of the chief inquisitor, to be shown all the children of the family. There were eight. They were found asleep in bed. Amidst the tears and lamentations of the mother and the calmer grief of the father, the officials selected one child, Edgar, of only seven years of age, tore him from the embraces of his parents, and carried him away weeping and terrified to the prisons of the Inquisition. The cause of this strange outrage was reluctantly told. It seems that a servant of the Mortaras, a Roman Catholic, whose character is said to have been infamous, had secretly baptized the child, as she affirmed, when it was ill of a dangerous disease. But her story was contradicted by the parents, and she seems to have been wholly unworthy of belief.² She had told the priests of what she had done, and the Church had resolved to maintain its claim to the possession of its unconscious convert. The mother, when she saw her son ravished from her, fell fainting upon the floor; the neighborhood was alarmed by the cries of the children. In the morning the boy was placed in a carriage and hurried away to Rome.

And now began the long and fruitless pursuit of their lost child by the wretched parents. They followed him to Rome; they besought the officials of the papal court to restore him to their arms; they saw Antonelli, and strove in vain to convince him by proper testimony that the servant was a

profligate and a liar. He refused to interfere; but they were told mockingly by the priests that if they would become Christians they might regain their child. Once the father caught a glimpse of his son in the midst of a throng of priests in a convent chapel, but when he endeavored to speak to him he was hurried away. The parents were afterward permitted to see their Edgar in the presence of his captors. The father overwhelmed him with kisses and tears; the boy seemed anxious to follow him home, but he was again hurried away to a distant convent at Alatri. Here, too, the Jewish parents followed him secretly, and again saw their child at a distance, and again they were driven away by the priests, and were even in danger of ill treatment from the fanatical populace. It was no longer safe for a Jew and Jewess in 1858 to travel far in the papal dominions.¹

But the story of the abduction of Edgar Mortara became known to all the Jews of Europe and America, and an intense resentment filled all the powerful race, who had thought for a moment that their persecutions had ceased forever. The last insult of the papal court might well seem the most cruel they had yet endured. What Jewish child was safe, what Jewish family might not suffer the fate of the Mortaras, if the power of the priests were equal to their audacity and pride? Europe rang with the remonstrances and the lamentations of the Jews. The memory of their ceaseless sorrows in the past seemed renewed with fresh bitterness. They saw once more the burnings, the tortures, and the exactions, the banishments, the robberies, of English kings and French Crusaders, the rage of Arbaes and Torquemada, and the mocking tenderness of German lords. Yet the Jews in their affliction found many defenders. The liberal press of France, England, and America denounced the cruelty of Pius IX., and even calm and enlightened Catholics denied that any such extravagant right to seize the children of heretics or unbelievers was inherent in St. Peter's chair. But the pope and the Jesuits loudly defended their act.² The pope refused to give up the child even at the solicitations of foreign courts and powerful influence; and the *Univers* and the *Civiltà Cattolica* enlarged on the happy fate of Edgar Mortara. They pointed out that the right to seize Jewish children was one that the Church had always claimed. They asserted

¹ Le couvert de caresses, de baisers, des larmes, etc.

² The *Civiltà Cattolica*, on Il piccolo neofito Edgardo Mortara, denounced as heretics all who denied the pope's authority over baptized children. Lacouture, p. 3. The *Univers* was equally firm. The ultramontanes must therefore still entertain the opinion that all the children of Jews are held by their parents only on sufferance for the pope, for this was the decision of the Council of Toledo, 633. The *Univers* said it was the universal rule of the Church.

¹ Mortara. *Le Droit Canon*, etc., Paris, 1858. Abbé Delacouture boldly denounced the whole affair.

² This was the statement of the parents, and was probably true.

that the authority of the natural parent was as nothing to that of the spiritual. They assured the Jews that their involuntary convert would never be given up, and that the Church had made him its own.

The Mortaras never regained their child. Broken-hearted and reduced to comparative poverty, they fled from their insecure home in Bologna to become wanderers in distant lands. Edgar grew up in a convent, forgot his parents, and has become, it is said, a priest. The pope and the Jesuits, safe in the protection of France, mocked at the impotent rage of the Jews. The fatal insult they had inflicted upon a sensitive race seemed never to be avenged. Yet the moment of retribution at last arrived. The papacy fell into ruin while proclaiming to the world its own infallibility, and in the wreck of the French empire the pope was hurled forever from his temporal throne. It is said that of all his Italian foes, the most resolute and active have been the Jews; that the Italian press owes much of its brilliancy and vigor to the gifted offspring of the rabbinical schools, and that with keen sarcasm and unsparing ridicule the Jews have never ceased to assail the Jesuits and the priests, who still assert their right to snatch children from their parents, and exercise those repulsive acts of persecution that offend the plainest principles of humanity and of civilization.

With the fall of the papal throne and the liberation of Italy, the chosen people seem to have reached the realm of universal amity and peace; nor, unless their ancient persecutor¹ should be raised amidst some wild convulsion to a new yet transient supremacy, will they ever again be forced to resume their wanderings, and fly, decimated and impoverished, from land to land. A new period is opening for them, when their prosperity and progress may atone for their past sufferings, and when, amidst the gradual spread of humanity and refinement, they will be able every where to illustrate the benevolent principles of the Talmud, and join the great host of civilized men and women who are laboring to spread over all the world the reign of a divine charity.² That they have forgiven and forgotten the errors and the crimes of their misguided persecutors, that they have ever consented to add to the prosperity and cultivate the intellect of those lands where they were once treated with inhuman severity, are among the most pleasing traits of their history; that

they have been teachers rather than warriors, industrious and frugal rather than the destroyers of the products of human labor, is their rare praise, and one that belongs to few among their rival races. Wherever they have gone they have added to the wealth of nations, and increased the sum of human felicity. The Talmud abounds in lessons of virtue, of gentleness, of forgiveness, and of peace, many of which men have yet to learn; it enforces and defines the highest principles of progress. "Be persecuted," it teaches, "rather than persecutors." "The repentant is more honored even than the righteous." "Never," exclaims one of its teachers to his disciples, "engage in prayer until you have first performed some act of charity." The most rational form of worship, it suggests, is to labor in the boundless fields of benevolence.

But the most remarkable trait in the story of the Jews is the singular devotion they have always shown to mental culture, and the priceless benefits they have reaped from their sedulous care of education. This has been the potent spring of all their wonderful preservations and their indestructible energy. The school-master has saved them from the fate of Babylon and of Tyre. It was because they were educated to industry, neatness, docility, and order that they survived the persecutions of priests and kings, and have beheld the destruction of all their foes. While papal Rome left all the world in ignorance, and has ever opposed the progress of knowledge in every land, while under its barbarous rule Italy, Spain, and France were left with a debased population, of whom not one-third could read and write, the prey of a corrupt nobility and of immoral courts, the Jews have always set the example of a general education. While in Europe and America the Papal Church is every where denouncing the cause of public instruction, the Jews have always been the firmest of its defenders. In our own country the common-school system has no more strenuous supporters than the disciples of the Talmud, and no bitterer foes than that uncultivated Church which would snatch children from their parents and hold them in perpetual barbarism.³ Nor is the condition of the two contending powers unconstructive. The Papal Church is perishing amidst the ignorance in which it has labored to envelop itself; the Hebrew race is entering anew upon an unimpeded progress. The lesson of the Jewish story, indeed, is

¹ I must not be thought to include the more intelligent and patriotic Roman Catholics in the ranks of the Jewish persecutors, or the enemies of free education, but their influence seems not yet felt in their Church.

² Few have read without interest and delight the essay on the Talmud by the lamented Deutsch, whose learning and genius have thrown new lustre on his gifted race, whose early death has left no common void in the ranks of scholarship.

³ The *New Era*, the Jewish magazine of New York, has afforded one of the best defenses (June-October, 1878) of our common schools, and rebukes with vigor the Roman Catholic priests, who are laboring to destroy the foundations of American progress. It is no uninteresting spectacle to study the struggle between the persecutors and the persecuted in our midst; to observe how steadily the latter adhere to the cause of knowledge, how fiercely the former assail it.

that education alone can preserve the permanence of races, and that the perpetuation of nations and of institutions rests upon the intellectual cultivation of the people; that the school-house is more potent than fleets and armies, and that the school-master is the modern king.

MILDRED IN SEARCH OF A HUSBAND.

I.

"YOU will never find a truer heart nor a finer nature," said Mrs. Stanton, impressively.

Mildred pouted, looked half ashamed but wholly unconvinced, and, with a wisdom unusual at her age, held her tongue.

She was a pretty little creature, of that diminutive type that all the world conspires to caress. Large eyes of a golden hazel, strange contrast to the dark lashes, looked out from under a fair smooth forehead with a dreamy poetry in their wistful gaze, more than half contradicted by the saucy expression of the little nose and the many dimples round the smiling mouth. A close student of character could readily detect in the warring elements of that face the chaotic nature of the undeveloped soul within. Intense affection; æsthetic sensibilities; a thoroughly untrained intellect, throwing out feelers wildly in all directions; a native shrewdness that passed for brilliancy; a dramatic capacity that hovered on the borders of deceit; a large amount of what the Yankees call "faculty," curiously combined with an inveterate addiction to day-dreams; courage, coquetry, obstinacy, sharpness, and romance—made up the larger part of that half-grown character. At seventeen, a woman in her sensibilities, a child in every thing else, there was no predicting her fate, because it was impossible to tell which side of her kaleidoscopic soul was to be held uppermost by the master-hand that was to sway her destinies. At present she reflected, chameleon-like, the color of her surroundings.

And it was this perplexing nature that Mrs. Stanton proposed to take from her country home to spend a winter in the city. Mildred's step-mother made no objection—indeed, was pleased, and there was no one else to consult. The question was apparently settled, to Mildred's intense delight, when an obstacle asserted itself in the shape of a sturdy young farmer, with whom the young lady had been carrying on a desperate flirtation all summer. She must play at love and romance with somebody, and he was the best and nearest lay figure upon whom to hang the gorgeous draperies of her fancy. Her lively imagination had conjured up an atmosphere of romance about them both, in which fools' paradise she contrived to kill a

great deal of time, and utterly to bewitch and captivate the susceptible heart of Roger Treadwell.

But with the first whisper of a city visit all this magic atmosphere was rudely dispelled, brushed away in a twinkling, like the morning cobwebs from the dewy grass. Mildred awoke with a start from her day-dream to see her hero with disenchanted eyes. It was to her as though the elegant shepherd of a Watteau fan, with his dainty dress and powdered hair, and all his glory of ribbons and rosettes, had been suddenly transmuted into a perspiring laborer, in a red shirt, pitching hay into a dusty barn.

Her second vision was as unreal as her first. If before her eager glances aimed too high, now they shot too low. Roger was no hero of a pastoral poem, made up of impossible refinement and an interesting lack of education, as the heroes of idyls are wont to be, but a young fellow of sterling qualities, excellent sense, warm and steadfast affection, and reasonably good-looking withal. He had not the brilliant possibilities of Mildred, but neither had he her infinite capacity for going to wrack and ruin. He answered to Schlegel's description of "the most agreeable of all companions—a simple, frank man, without any high pretensions to an oppressive greatness; one who understands the use of life, and loves it; obliging alike at all hours; above all, of a golden temper, and steadfast as an anchor."

It was very natural that this dazzling vision of a winter in the city should alarm him, and that he should oppose its realization most vigorously. But he begged, entreated, insisted in vain. Mildred, fascinated by the alluring prospect of possible romances, peopled by brilliant heroes from the realms of poetry and art and wealth and fashion, turned to him steadily her coldest and most stubborn face. She became unyielding ice, this petted maiden, who, a few weeks before, had looked into his face with a romantic adoration she had even persuaded herself she felt.

He humbled himself to the last resort of desperate mankind, and sought an intercessor. Mrs. Stanton's invitation had done the mischief, he argued; surely Mrs. Stanton's influence over Mildred might undo it, and so help him. Mrs. Stanton respected, liked, and pitied him from the bottom of her heart, and tried her best with Mildred, summing up a long list of Roger's good qualities with the prophetic utterance we have already quoted.

"If you will give Roger your promise," said Mrs. Stanton, after a long pause, while Mildred gazed with determined eyes out of the window—"if you will only assure him that you will be his wife when you come back, I'm sure he will let you go, trusting fully in your faith and truth. You had bet-

ter think of it seriously, my child; you could not find a stronger arm or a stouter heart among all your heroes of romance."

"No!" cried Mildred, springing to her feet with sudden energy, her eyes fairly ablaze with excitement; "I will *not* have Roger Treadwell! Do you want to bind me down, Aunt Clara, to be a household drudge and slave, to wear my life out in these horrid, useless little things that one has to do over and over again forever, and never be done with? Do you think I can be content to sit down in Roger's kitchen all my life, and hear him talk about the crops and the cattle, and spend my days cooking his dinners and mending his clothes? Is that all I was made for? Because, if it is, I would rather die this minute, and be done with it!"

"Mildred," asked Mrs. Stanton, quietly, when this sudden blaze had spent itself, "was Roger talking of nothing but crops and cattle all those long moonlight evenings that you spent together under the elms?"

Blush after blush went up to the top of Mildred's forehead like the waves of the northern lights.

"Aunt Clara, you are too bad!" she said; "you know that is very different! When you are married, it is quite another thing. People expect you to please them then, instead of their pleasing you. If I marry at all, it must be somebody who is infinitely my superior," pursued Mildred, with the satisfying conviction that she was giving utterance to an original and lofty sentiment—"some one I am afraid of, who can teach me, and whom I shall thoroughly respect. I can't have that sort of feeling for Roger. He is all very well in his way—out-of-doors—but, somehow, when he comes into the house he seems to take up all the room, and his voice is so loud, and his boots creak, and his hands are rough." An expressive shudder concluded the catalogue.

"Very well, Mildred, I will say no more. A husband whose boots creak is certainly something to be dreaded. We will give poor Roger his dismissal. You shall go to the city, and follow out your own sweet will, and let us hope that a fairer destiny is in reserve for you."

Mildred hung her pretty head, but half satisfied. A dim conviction began to dawn upon her that there might be problems in life of a gravity even beyond the ken of herself or her boarding-school cronies. Dr. John Brown tells an inimitable story of a Scotch shepherd who said of his solemn dog, "Oh, Sirs, life's full o' sairiousness to him; he just never gets enough o' fightin'." Some faint idea of this *sairiousness* of life began to pierce through Mildred's consciousness, and to fill her with a vague uneasy sense that perhaps even in the city people did not always live in a cocoon woven of their own dreams.

But the doubts and difficulties she dimly foresaw overnight were dispelled with the first ray of morning sunshine, and Mildred woke to dream by day of all the vague delights the future had in store for her. It was all her eager little soul could do to remain in its bodily prison till the happy day and hour came when she was actually driving with Mrs. Stanton through the keen October air to the little country station, whose battered doors seemed to her as the gates of Paradise.

II.

Mildred had been in town three weeks, had tasted of all the gayeties of the metropolis, had feasted her eyes with pictures and her ears with music, had seen "the best society" in its best raiment and on its best behavior, had been dazzled, bewildered, excited, till her little head was in a whirl; but she had not yet met "the calm superior being" who was to take the supreme direction of her little flustered soul. Calm superior beings of various heights and descriptions she had met frequently, it is true, but they had cast an indifferent glance at her, and passed by, as cold and remote as the stars themselves.

And so the tide of fashionable life swept on, bearing with it this sharp-eyed, silly little child, whose romantic visions were gradually losing color and brightness as the novelty wore off, and permitted her to see the everlasting commonplace beneath. She was growing weary of it already; not strong enough to keep her head above the current, and strike out independently where she would, she was tossed like a drifting straw from wave to wave, or eddied into a corner, to be forgotten in sluggish quiet. There she lapsed into fits of depression that took the life out of her eyes and the color from her cheeks, in which she sat for hours with her chin upon her hand, dimly conscious of an aching void.

In one of these blank gazes into vacancy Mrs. Stanton caught her one early November twilight, and shook her out of apathy into delight by proposing to take her to see *Hamlet* that very evening. It was to be her first introduction to a metropolitan theatre, with all its glitter of lights, its array of fashion, its splendor of scenery; and it seemed a long and tedious interval to the impatient Mildred before they were actually seated in their places and the curtain rose.

The cold air of the stage that struck upon her glowing face as the battlements of the castle came into view seemed to her excited fancy to blow straight from Elsinore, and she shivered in sympathy with the weary sentinels. As the play went on, a strange exaltation possessed her and kept her quiet. She seemed to herself as lifted above all outward demonstration by the very strength

of her excitement and the swift succession of her emotions. Her eyes riveted upon the hero of the play, in whom the wildest dreams of her fancy seemed realized, she followed every motion of the slender, graceful figure, drank in every tone of the thrilling voice. Like Miranda, she would have said,

"I might call him
A thing divine; for nothing natural
I ever saw so noble."

The curtain fell upon the first act, and the audience awoke to life again. The usual hum of theatre talk, with its noisy background of orchestral music, began. Young ladies expressed their voluble delight in all the adjectives of their extravagant vocabulary; jealous young men ventured faint sneers, and were instantly suppressed with contempt by their fair adversaries; old theatre-goers shrugged their capacious shoulders, and murmured of Kean and the elder Booth; matrons settled themselves more comfortably, and talked of their children and their servants, while their husbands compared notes as to the last "quotations" (not Shakspearean).

But the play went on, and the charm that held Mildred's imagination waxed stronger. To her unsophisticated eyes the spectacle was a reality. They were the solid towers of the veritable Elsinore that she beheld, and it was Hamlet's self that wandered musing through the spacious halls, and questioned the grave-diggers in the church-yard. Recalled to a sense of the actor's existence outside of the play by the various criticisms of the people near her, she created for him an ideal life, in which he moved a princely and romantic figure through Shakspearean surroundings, while she herself, a happier Ophelia, sat at his feet and talked blank verse by the hour.

"Does Mrs. Deuce act this evening?" asked a voice, rudely dispelling her reverie.

"No," answered a young dandy by her side; "she's left the stage, you know, and they've put on some horrid wretch by the name of Price instead."

Mildred stared at him in blank dismay. That stately creature in the royal robes to be mentioned so disrespectfully, and the solitary Hamlet discovered to be a mere ordinary married man! The shock was terrible. But her sanguine spirits soon rallied. Probably Mrs. Deuce was a useful but uninteresting woman, incapable of really appreciating her husband, whom he had married in the hasty impulse of unthinking youth. Had he but waited till he had met her! She was convinced that in herself alone were the possibilities of that perfect companionship for which he must be seeking in vain. Still, although Fate had interposed to prevent their union, she might still become his friend, and perhaps, in future years— Here Mildred lapsed into a vague reverie of pos-

sible delights, till the curtain fell for the last time, and her dreams and the play were ended together.

For the moment only, for Mildred rode home in silent ecstasy, hugging to her romantic little heart the dear delusion she had formed. A recollection of Roger crossed her mind, to be repelled with sudden disgust. How different this radiant vision, with its noble bearing, its golden locks, its romantic grace, its subdued sorrow! She tossed and turned upon her restless bed all night, determined *not* to go to sleep, but to recall every look and tone and gesture that had charmed her.

The next day she possessed herself of Mr. Deuce's picture, stolen surreptitiously from the drawing-room album, and pored over his features till her eyes were dim. She wrote lame verses in his honor, and sent them to the newspapers, whose editors, it is needless to say, mercifully consigned them to the waste-paper basket. She came down to breakfast without appetite, and with great black rings round her eyes. She lost all interest in shopping and other innocent amusements of her age and sex, and manifested a morbid relish for solitary musings and sentimental poetry.

It was easy to discover so patent a disease, but to cure it was another matter. Mrs. Stanton tried every remedy usually considered effectual in such cases, but in vain. Reason, persuasion, ridicule, were essayed by turns, and failed. To the enemy's fire Mildred opposed every resource she could command—smiles, tears, pathos, sullen silence, outbursts of eloquence, artful contrivances, as the occasion demanded, but always an immovable obstinacy. Tired of the unavailing struggle, and really alarmed for the girl's health, Mrs. Stanton at last resolved to try a heroic remedy, for the first suggestion of which she had to thank a great actress, long since dead and gone. The preliminaries all settled, this tender-hearted lady began to have sundry scruples and qualms of conscience.

"If I succeed in breaking up Mildred's infatuation by this plan which you approve," she said to her husband, "I run the risk, I am afraid, of imbittering the child's fancy, of destroying her ideal, of taking the poetry out of her life."

"Taking the nonsense out of her silly little head, you mean," retorted Mr. Stanton. "My dear Clara, do you mean to tell me that you consider the first fancy of a half-grown girl as having any deeper hold on her existence than the grass seed lodged in the crevices of your pine cone yonder? Take the poetry out of her life, forsooth! Why, she doesn't know what poetry is yet! You get this foolish notion out of her head if you can, and I'll answer for the recovery of the patient."

As the result of this conversation, the astonished Mildred was told to prepare for a call upon Mrs. Deuce.

III.

It was with no little flutter of spirits that the youthful devotee took her place in the carriage beside her aunt. Actually to be about to breathe the same atmosphere wherein her bright ideal lived and moved and had his being was a sensation of itself. Then to see the exquisite goddess that ruled his fancy was necessarily a great event; for Mildred had reached the topmost stage of exaltation by this time, and had persuaded herself that Mrs. Deuce must be a perfect being, to be chosen by so great a man—young, graceful, beautiful, of course, with a low sweet voice, and large eyes full of soul, a musical instrument, in short, of the human variety, ready to give back its rarest melodies to the hand of genius. Such was the ethereal creature, half muse, half angel, that Mildred's imagination had created for one of the roughest uses of this workaday world.

They entered Mrs. Deuce's apartments in one of the fashionable hotels; and what a change came over the spirit of Mildred's dream!

Being rather below the medium height himself, the attraction of opposites had given to Alfred Deuce a wife of superb proportions. Mrs. Deuce was a tall and ample blonde, with a loud ringing voice, and a breezy manner that was cheery as the sunshine, but to Mildred's morbid fancy exceedingly repulsive. Her superb hair hung in two frowzy braids over her shoulders, adding possibly to the youthfulness, certainly not to the grace, of her appearance, and the magnificent lines of her Juno-like figure were hidden by the awkward folds of an ill-made wrapper. Mildred hated large women—as what young girl does not?—and for this full-blown dispeller of her dearest dreams she conceived an instant and unconquerable aversion.

The room, too, was a sad shock to Mildred's imagination. Sundry garments of theatrical cut and color, and none of the freshest, trailed across the faded furniture. On a table were the dingy and tarnished remains of a late floral triumph, half hidden from sight by the tattered leaves of a prompt-book pitched carelessly upon the decaying flowers. On the same table, to Mildred's horror and dismay, lay a wig of long and curling golden hair; she feared she recognized the flowing tresses as Hamlet's own.

"Yes, that's the very wig Deuce wears in *Hamlet*," said his wife, in her cheerful voice, with a little nod, as she caught the direction of Mildred's eyes. "Bless you, my dear, you didn't think it was his own hair, did you? Ah, no; that's a 'dandy gray

russet,' as I tell him—the little he has, that is, for he keeps it cut uncommonly short. Ah, dear! and to think when I first knew him his curls were my pride! But law! what's beauty!" she added, with a laugh; "provided you've good bones and a decent nose, that's all the stage needs in the way of beauty nowadays."

"I—I don't quite understand," stammered Mildred.

"Mrs. Deuce means, my dear," good-humoredly interposed Mrs. Stanton, "that the art of 'making-up,' as it is called, has reached such perfection that a mere foundation is all that is necessary."

"Precisely," said Mrs. Deuce; "give Pader and Co. an idea of the figure you want, and they'll turn you out the graceful, or the athletic, or the corpulent, just as you like; juvenile tragedy or heavy business, it's all one to them."

"But surely," ventured Mildred, with a blush, "Mr. Deuce can have no need of their assistance."

Mrs. Deuce burst into peal after peal of loud but musical laughter, in which even Mrs. Stanton joined, to Mildred's great confusion.

"You dear little innocent!" she cried at last, the merry tears standing in her eyes; "why, he's all made up, every bit of him, from his waist down; and his arms and his shoulders are padded too, for that matter. Then with those flowing golden curls there, and a little extra eyebrow, and a judicious use of rouge and powder, and so on, why, we make quite a dazzling appearance at night, and fascinate all the young ladies," she added, with a sly glance at Mildred.

"How is Mr. Deuce, by-the-way?" interposed Mrs. Stanton, who wished to give Mildred a chance to recover from the disgust she saw but too plainly visible in her face.

"Tolerably miserable, thank you," said Mrs. Deuce, cheerfully. "He had a bad fall in *Romeo* last night (third act, you know); hit his head, and gave himself a wretched headache; so he's in retirement this morning, hoping to get rid of it."

"I should think that fall might be very dangerous," said Mrs. Stanton, "it's so impetuous, so unstudied—"

"Unstudied!" laughed the actress, with a fine scorn; "why, if he has rehearsed it once, he has a thousand times! All these things have to be carefully studied, bless you! There's not one of you young ladies," she continued, turning to Mildred, "I don't care how vain she is, who spends so much time before her glass as my husband does. Hours and hours together he's at it. So was I before I left the stage. My dear, you little think, when you see a play running smoothly, of the days of anxious thought and work that have been spent on it. Many's the time I have said, like Touchstone,

not for my spirits, if my legs were not weary!"

A brisk knock at the door; and in answer to Mrs. Deuce's loud "Come in!" enter a waiter bearing a tray, in which reposed a huge beefsteak, in a very underdone condition, a loaf of bread, and a foaming toby of ale.

"Ah, that's my husband's lunch," said Mrs. Deuce, bouncing from her seat. "I know you'll excuse me if I take it in to him. I won't be a minute. You see, he plays Richard the Third to-night, which is very heavy business, and nothing but plenty of half-raw beef can keep him up to it. You've no idea of the strength it takes."

So saying, with a cheery nod, she vanished into the inner room, and Mildred tried to collect her bewildered senses, and realize the horrors of the situation.

An oppressive odor of stale tobacco-smoke hung about the room, sufficiently accounted for by a couple of blackened pipes upon the mantel-piece. A neighboring whisky bottle also asserted its fragrant presence, and two or three dirty glasses still stood beside it. Play-bills and newspaper cuttings were strewn over the open piano, amidst a litter of Shakspearean songs, photographs, and "parts," in manuscript. A dusty sunbeam slanted, like Ithuriel's spear, across the tinsel lace of a royal mantle, and betrayed its shabbiness. Wherever Mildred turned her asking eyes she beheld the wrong side of her dream-fabric—the trade, and not the art. Instead of an ideal Prince of Denmark living in a perpetual atmosphere of poetry, here was a mere mortal in a dirty lodging, devouring raw steaks and swallowing bitter beer by the quart, as a preparation for identifying himself with the glorious creations of Shakspeare! It was too dreadful. Every thing must be a mockery and a delusion; there was no such thing as poetry, no such thing as art.

Mildred's reflections were interrupted at this point by the return of Mrs. Deuce, her sunshiny face all dimpled with some merry recollection.

"I must tell you something rich that happened the other night," she began. "You remember Hamlet's exit in the first act, where he follows the ghost, holding his sword with the cross up? Well, young Pinto, the poet, you know, came to me in Deuce's dressing-room during the second act, while I was making some tea, all in a wild *enthusiasm* about that exit. 'I never saw a man so possessed by a part,' says Pinto, turning up his eyes; 'to witness his unearthly pallor, and his fixed gaze, and to see his lips move as if muttering a prayer—it was something awful, I tell you. By George! it will haunt me all night, Mrs. Deuce.' Well, I thought I should have died. I fairly shouted with laughter; and there sat

poor little Pinto staring at me with his great grave eyes, as if I were a raving lunatic. I'm ashamed to confess it, Mrs. Stanton, but the fact was, that when Pinto thought Deuce was muttering a prayer, he was really swearing like a trooper at the prompter, who had forgotten to have the lights lowered for the exit. Poor Pinto!" And off went Mrs. Deuce again in another burst of boisterous laughter.

Mildred could bear no more, and threw such an appealing glance at Mrs. Stanton that the latter rose at once to take leave.

"You know I'm not often so untidy as this," Mrs. Deuce whispered to her, as Mildred was rushing down the stairs in advance, "but I set the stage as you requested."

Mrs. Stanton nodded her thanks, and hastened to rejoin Mildred, who had already buried herself in the carriage cushions, and was sobbing as if her heart would break.

Poor little girl! The bloom had been rudely rubbed off the flower, the first illusion had been destroyed, and she felt as if life could have no more pleasure in store for her. A dreary waste of barren years seemed to compose the future; "the light that never was on sea or land" no longer shed its bewildering radiance over her destiny, and she saw herself wearily treading the tiresome every-day paths whence the ideal had forever fled.

Mrs. Stanton meanwhile felt every sob go to her heart. Realizing the misery that Mildred was suffering at the moment, she forgot the wonderful elasticity of youth, forgot the April nature of its smiles and tears, and reproached herself bitterly for what she had done. She tried to soothe Mildred by every means in her power, but Mildred obstinately refused to be soothed.

If the truth must be told, at the bottom of her little heart there lurked a consciousness that she was becoming very interesting; all the girl's dramatic instincts awoke at the suggestion; she caught the situation with her keen perceptions, and was ready to play the suffering heroine, the lovely bud with a canker at its heart, to the admiration of any and all beholders. It was the luxury of woe that she enjoyed. She was really very miserable, and yet this curious doubleness of her nature enabled her to get a certain pleasure out of her very sufferings, a thorough satisfaction in her grief.

Having wept away the first violence of her disappointment, she was ready, when evening came, to go down stairs in a costume of appropriate pensiveness, and play the pretty part of the bruised and broken lily. She spoke in a subdued tone with the sweetest of modulations; she drooped her pretty head upon her hand, and sighed softly but demonstratively; she gazed with sad intentness into vacancy, and started violently when addressed by name; she allowed the furtive tears to gather in her uplifted eyes

when she thought any one was looking at her; and, in short, enacted the "heart bowed down, with grief oppressed," with such admirable truth to nature that poor Mrs. Stanton was rendered quite miserable. As to her husband, his more stolid masculine sympathies were not so easily roused. From time to time he eyed Mildred intently, caught all her poses with a furtive glance, and relapsed into his newspaper again.

In the marital tête-à-tête that night he was not so sympathetic as his wife expected, and, indeed, talked in such a way as almost to justify her, she declared, in calling him a brute.

"My dear," expostulated this obdurate husband, "I don't say the girl's happy; I only say she is not very miserable. Now mark my words, *she'll get over it*, and a great deal sooner than you will, probably. Girls that are really heart-broken don't usually find it a beautifying process, whereas Mildred's misery is quite interesting. I never saw her look prettier than she did to-night; and the way she managed to control her grief within *becoming* bounds," said Mr. Stanton, with a chuckle, "really did equal honor to her head and her heart."

"Hard-hearted monster!" said his wife; "you've not a particle of feeling in your composition, and it's quite useless to talk to you."

"I'm delighted to hear you say so, my dear, because I happen at this moment to be intolerably sleepy. Reserve your romance for the morning, when I hope I shall be more awake to the situation."

IV.

Three or four weeks flew by, with their changing round of cares and pleasures, and Mildred was beginning to console herself. In the first chill of her disappointment she had dared to look with indifferent eyes upon the reigning hero of society, the leader of all the fashionable Germans, Frederic Kingsley.

It is impossible to describe with any precision a being so indefinite and so ephemeral as a metropolitan leader of fashion. The erect and stylish figure; the regular, insipid features; the well-trained mustache; the elaborate carelessness of dress; the studied attention to the caprice of the hour, in hat, cravat, or cane; the air of mingled indifference and satisfaction; the finished elegance of salutation and deportment—all these mark the species: it were vain to seek to define the particular glory that crowns the individual. Whatever that occult charm may be, Fred Kingsley possessed it, and held undisputed sway over the glittering host. In a moment of idle good nature he had condescended to pay Mildred some slight attention: his astonishment can hardly be conceived when he saw that attention received with marked indifference. There

could be no mistake; the alight was unmistakable, and, unfortunately, not unperceived by others. The injured young gentleman was wounded in his deepest, tenderest feeling—his self-love—and vowed immediate vengeance; the rebellious maiden should be brought to subjection; she too should "own the power supreme" of this modern Zampa.

Then began the siege of a heart, as conducted in fashionable circles, and after the most approved methods. Hostilities were opened with a fire of bouquets of enormous dimensions, constructed after the model of fashionable society, wherein the poetry of the flowers was lost in one confused crush of expensive ugliness. Morning calls, afternoon drives, flying visits at the opera, meetings at church doors, and at all the Germans tender glances in the pauses of the dance, airy nothings of every sort—all tending to enhance Mildred's value in her own eyes—followed in quick succession, and awoke a new excitement in her life. For society recognizes in its votaries, instead of that obsolete organ called a heart, an overweening vanity that must be ministered to on all occasions. The wooing of fashionable life is not to be carried on *sub rosa*; the world must see the adorers at Beauty's feet, and realize their subjection, or Beauty values their useless homage not a whit.

The attentions of Fred Kingsley, therefore, in his attempt to subjugate the rural belle, who alone had turned a deaf ear to him, were all based upon the dictates of society, and Mildred speedily found herself an object of public notice. Her heart still throbbing with the romantic visions of a blighted existence and an early grave, this worldly homage at first was merely vanity and vexation of spirit. She sniffed contemptuously at the first huge bouquet that was laid upon her shrine, tossed the card into the fire, and left the flowers to wither, unwatered, upon their wooden stems.

But society came to the rescue of its idol. On all sides went up the pæan of Fred Kingsley's praise, and Mildred's vanity began finally to answer the constant appeals to it. Was it possible for any maiden to remain forever obdurate who saw herself the envied recipient of a homage the gay throng of girls around her were striving for in vain? She began to regard life not as a book of poetry bound in boards, but as a novel of fashionable society printed on hot-pressed paper, with gorgeous velvet covers and a golden clasp, for private circulation. The bouquets at last awoke a smile, then a blush; the cards were tenderly preserved, the calls graciously received, the invitations frequently accepted. To all Mr. Kingsley's attentions, however, Mrs. Stanton opposed a silent but pertinacious resistance. Too wise to offer an open warfare, she laid all the subtle ob-

stacles her woman's wit could devise in the conquering hero's path, and strove to avert the evil consequences she could not help foreseeing.

But Mildred's vanity, in the atmosphere of adulation by which she was surrounded, had rapidly outgrown all bounds, and she had come to believe herself the absolutely irresistible creature she had been described, and listened to all allusions to Fred Kingsley's endless conquests and endless inconstancy with an incredulous smile, secure in the assurance that she had fixed his wandering fancy, had conquered the conqueror of so many hearts.

To say that Frederic the magnificent was not fully aware of the situation, would be to do that resplendent hero injustice. But he was not yet quite satisfied. Some sort of avowal must attest to himself, at least, his triumph. While wondering how best to bring the little drama to a happy close, graceful and dignified, but at the same time definite and decided, he chanced one evening to saunter into Mr. Stanton's opera-box. They were singing *Faust* that night, and the curtain had risen upon the garden scene, the sweetest, saddest scene of all the lyric drama.

Mildred held up a warning finger as he entered, and he sank in obedient silence into a seat at her side, so close to her that her golden-brown curls were stirred by his breath. As the last passionate notes of the music died away, Mildred, quivering beneath its subtle enchantment, looked up and met Frederic's dark eyes fixed upon her with an intense expression he had rarely found ineffectual. Agitated and bewildered by all the strange, sweet influences of the hour, Mildred could not support the fire of that ardent gaze. She did not dare to lift her eyes again, but sat rapt in a golden dream, till she found that by some happy accident they were walking home together. She thought of *Faust* when he first met Margaret, and of the sweet Italian phrase in which he offered her his escort:

"Permetterste a me, mia bella damigella,
Che v' offra il braccio mio, per far la strada insieme?"

The lovely tones sang themselves over and over in her mind, uninterrupted by any harsher speech, for her *Faust* was far too wise to break the charm.

At last they stood together under the soft-ened light of the chandelier in the hall. Solitude and silence all around them, noiseless echoes of that entrancing music haunting the air, rich scents from the flowers in the distant conservatory stealing upon their senses to complete the spell. A strange dreaminess seemed to possess Mildred's soul, a delicious languor, a calm that was not peace, but the very climax of excitement.

"Good-night!" she whispered softly, as she raised her eyes to his.

"Good-night!" he murmured in reply; but his deep gaze still held her own, and his clasp of her hand grew more tender and more firm. Mildred's fascinated eyes, with their dreamy light, looked into his, her slender form imperceptibly swayed toward him, his arm stole softly round her, and their lips met in a half-unconscious kiss. "Darling!" he murmured; and in another instant he was gone.

Mildred was quite content. Another word or look would have called her back from heaven to earth again. As she stole softly up to bed, her dazzled eyes shining like two golden stars above her glowing cheeks, Frederic the victorious was sauntering serenely along the Avenue, his complacent soul filled with a gentle sense of triumph as he thought over his last success, and felt himself once more thoroughly re-instated in his own good opinion. The fortress had surrendered; the siege was raised; and the conquering hero marched off with flying colors, to fight in other fields.

V.

It will easily be conjectured that Mildred did not take the same view of the situation. She waited and watched for the departed victor till hope grew sick within her. Before many of the long and tedious days had dragged by, however, she heard that Mr. Kingsley had left town, was making a sensation in Philadelphia, Baltimore, Boston, no one knew exactly where. Then, like a sudden thunder-clap, came the news of his engagement to Miss Milyan, the great Boston heiress, and the fairer portion of Japonica-dom gnashed their pretty teeth with anger and despair.

To describe the tumult that raged in Mildred's soul when she could no longer doubt the truth of this report were a hopeless task. Before, it was her imagination that had suffered; now, her vanity had been insulted. She called it her heart, and sincerely believed that it was broken, and that she should never love again. There were no pretty posings now as Patience on a monument, no gentle dejected musings, no pensive tearful eyes. The clique that had watched her triumph were ready to laugh and gossip over her desertion if one sign of sorrow could be detected by their prying and malicious eyes. So Mildred tossed her pretty, scornful head, and faced the foe with as loud a laugh and as ready a sneer as any.

Mr. Stanton watched her with distress. He saw her bright gayety changing into flippancy and pertness and a certain disagreeable sharpness, while a worldly standard of expediency took the place of conscience.

"My dear," he said to his wife one day, "unless you can rouse the dormant good in that girl with some new and potent inter-

est, the sooner you take her out of harm's way the better. Another six months of this cursed city life would be the ruin of her. Neither her head nor her heart is cool enough or strong enough to stand it."

Mrs. Stanton, like any true woman, fought valiantly in defense of her pet, and then secretly acted upon the good counsel she had received. She tried to awaken Mildred's artistic sensibilities, now manifested solely in the dextrous arrangement of colors in her dress. She took her to picture-galleries; visited studios; introduced her to artists; surrounded her with amateurs, both male and female, who made up for their practical inefficiency by an immense devotion to the theoretical, and if they painted wretched pictures, certainly talked of *chiaro-oscuro*, foreshortening, handling, and breadth of tone in a most learned and fluent manner. Professional jealousy was all that kept these unknown geniuses, if we may believe their own statement, from standing on the top-most rounds of fame. Their pictures were so good that the committees refused to hang them, and the critics did not dare to praise them, while their subtle excellences were, of course, above popular comprehension.

Mildred took but a languid interest in the painters, and a still more languid interest in the paintings. The galleries bored her, and the studios were all alike, and smelled of pipes. She had no objection to spending an idle hour in making a bad imitation of an engraving, but as to serious study, she had no idea of it. Neither was her love of music any thing but a means of killing time. A waltz or an opera melody ran off her fingers glibly enough, but that was all she could do, and to a musician's feeling something in its very fluency made it unbearable. Clearly she was not to be saved by art.

After cherishing various artistic projects, and dismissing them as hopeless, Mrs. Stanton was compelled to resign herself to the reluctant conviction that Mildred, like most young ladies of her age, was an aspirant for matrimony, and that alone. Art and literature were well enough in their way as pastimes, but as pursuits worse than nothing. Charles Reade has said that there are two paths open to women—wedlock and water-colors. Mildred steadily refused to contemplate the latter alternative, and saw but one resource. More and more every day Mrs. Stanton was forced to observe the strange acidity that replaced the former sweetness of Mildred's nature, her growing petulance and flippancy, her want of reverence, her ill-concealed scorn of poverty—in fact, the gradual deterioration of her whole nature.

VI.

About this time Professor Steller came to make a visit at the Stantons'. An American by birth, but of German ancestry, he had

spent many years abroad, and had acquired that indescribable cosmopolitan polish, that mellowness of speech and manner, so peculiarly fascinating as an adjunct of superior wisdom. A man of immense attainments in more than one branch of knowledge, he had the susceptibility of a woman to the impressions of the moment, and the insensibility of a true *savant* to the permanent claims of any thing but science. He would part with his dearest friend with tears in his eyes, and forget his very existence five minutes afterward over his microscope. He was as soft-hearted as a child, superficially, and as cold as a stone beneath. In love with all women, he was capable of a real affection for none, and went through the world with legions of friends in the present, and hosts of enemies in the past. He possessed a rare faculty for imparting knowledge, and nothing gave him greater pleasure than to make a graceful selection from his vast stores of information for the benefit of some young girl; and he would sit for hours, with his pupil at his feet, pouring forth his eloquent words, his bright eyes gazing into hers, and his hand now and then enforcing some especial point by a tender and delicate caress.

For such a man a girl like Mildred had an especial charm. Her beauty, her intelligence, her sensitiveness, her childish ways, the tender appeal of her wistful eyes, fairly bewitched him. Considering her a child, he petted her like a child, and Mildred, soothed by the affection, forgot to ask its nature. The vanity that the winter's adulation had stimulated to such prodigious growth persuaded her that he, like all the rest of mankind, was at her feet. A new *Una*, with this lion by her side, she was to walk safely guarded through the world, and all eyes were to turn admiringly upon the fair young maiden and her majestic slave. It was a pretty programme, and Mildred did her best to have it carried out. Mr. Stanton, seeing only, as all the world might see, a grave elderly man making a plaything in his leisure moments of a clever child, saw no reason to interfere. Mrs. Stanton, hoping that science would do for Mildred what art had failed to accomplish, encouraged her in her new fancy by every means in her power. She wondered, indeed, that Mildred seemed to learn so little in her long talks with Professor Steller; that she acquired so few ideas; that she showed such a lack of interest in correlative subjects; and then she laughed at herself for expecting such a child to acquire a taste in a moment, as it were, for any thing more than the "fairy tales of science," the mere sugar-coating of wisdom's pills.

And so the comedy of human life went on, and the scenes shifted from night to morning, from winter to early spring. Professor Steller worked away all day and half the

night, Mildred ever on the watch to charm his leisure moments, and prolong them if she could. Did she love him, then, this preoccupied man, who, nevertheless, she was convinced in her vain little heart, loved her? Sometimes she thought she did. Then a remembrance of the evening when she last heard *Faust* came over her; the enchanting music filled her ears; a pair of dark eyes sought hers; a tender whisper, a fond caress; and with an impatient shiver she dismissed the stinging recollection. She painted to herself a possible future with the professor, wherein she sat, crowned with half his laurels, dividing the homage of the world. What was romance compared with glory like this, with a position that sovereigns could not command?

"I think there is no more romance for me," said Mildred to herself; "I have outgrown all that. Perhaps I have had my share of it. I, too," she sighed, with Thekla, as so many sentimental maidens have done,

"*Ich habe gelebt und geliebet.*"

She had learned the song by rote to please Professor Steller, and, as if the words were a charm to summon him, he rushed into the room.

"Give me joy, dear Mildred!" he shouted; "the last proof of my book is corrected, the last arrangements completed, and I am free!"

Now it is coming, thought Mildred, and instinctively closed her eyes lest she should see her impetuous adorer in the ungraceful act of going down upon his knees. Instead she felt herself whisked off the sofa by a strong arm, and whirled about the room in a frantic dance of joy.

"Now congratulate me, my child," said the panting professor, as he put her carefully back into her seat again, and threw himself down by her side; "every thing is settled to my perfect satisfaction, and I sail for Europe the day after to-morrow!"

"Sail for Europe?" cried Mildred.

"Yes, of course; what should I do here in this wilderness of a city, now that I have completed the arrangements for my treatise? Do you think I can afford to stay here in idleness, when I might be studying in London and Paris? No, no, child; I am going back to my masters just as fast as I can. But what is this, my darling? Not tears in the pretty eyes? That will never do. What will the prince say when he comes to claim his beautiful princess at my hands if he finds her lovely eyes grown dim?"

Mildred impatiently twitched away her head from the professor's tender efforts to dry her eyes, which were indeed brimming over, but with tears of disappointment and mortification rather than wounded love. This heart, of which she had felt so sure, was it to slip from her hold like this? How could she bear it?

"My dear child," murmured Professor Steller, in his softest tones, as he stroked her little hand, "you are angry with me, I see, because I have not told you of my going sooner. But I could not bear to distress the tender little heart for nothing, and it was all so uncertain. Forgive me, Mildred dear; I shall miss you sadly when I am gone; don't make it any harder by being angry now. Give me a kiss, my pet, and be friendly again."

But Mildred's dignity was all in arms, and she stiffly and persistently refused the offered reconciliation. With an air of offended majesty she withdrew, and Professor Steller, who had gazed after her retreating form for an instant with a puzzled face, buried himself in a new treatise on comparative philology, and forgot her in five minutes.

VII.

Summer had come back with all its riches of green leaves and fragrant flowers and glowing fruits, and Mildred had returned to her country home—returned, disgusted with life and with mankind, to become gradually somewhat disgusted with herself. Once out of the false atmosphere of flattery, in which she had been contemplating an enlarged image of herself, like the Brocken spectre, quite out of proportion to the diminutive reality, and again exposed to the kindly severity of home criticism, she began to find her true level. The last shock given her overweening vanity had done her good. The admiration and affection which she had really felt for Professor Steller had had at least the effect of rousing certain dormant faculties in her nature, which, once awakened, could not entirely be laid to sleep again. She could not contemplate the power of a life devoted to an idea without an uneasy sense that a wholly purposeless existence was a despicable thing. Even to fancy herself capable of loving one so greatly her superior, that that love must be wasted, like wine spilled upon the ground, had had a certain widening effect upon her conceptions of life. There were moments when, remembering only the charm that lingered in Professor Steller's words, the tears that gathered in his eyes when he bade her good-by, the warmth of his last caress, she felt through her whole heart a glow of affection for him that swept away all vestiges of her humbled vanity and her ruined hopes like a spring flood, and seemed to bring back the days when she first sat at his feet and listened to his wonderful stories.

But Mildred had not much time to ponder over the past, for sickness and sorrow came into the house, and kept her very busy. Mildred was no heroine, and would gladly have escaped if she could, but there was no help for her. Day after day she was chained to the weary round of household duties, only

released now and then, when the faithful Roger, ever on the watch to help her, managed to procure her some brief leave of absence. She had no time to bemoan the sorrows of the past or the miseries of the present, for when the few leisure moments came, she was too tired to be conscious of any thing but a delicious sense of rest. The necessity of self-sacrifice forced her to repress her selfishness, and brought out her better instincts, that grew stronger and truer by constant use. The insatiable vanity died out, in a great measure, for want of fuel to feed its flames. Something of the old sweetness returned to her disposition; a softer light dawned in the hazel eyes; a gentler expression settled about the saucy mouth. A quiet cheerfulness took the place of the rapid alternations from gayety to gloom that once possessed her, and her voice began to lose something of its sharp and wiry edge.

When Mrs. Stanton came in the autumn, she could not conceal her wonder at the change.

"I am so tired, Aunt Clara," said Mildred,

with a little smile. "I think I should like to go away somewhere and sleep for six months. If, as you say, I have grown so quiet and sober, that must be the reason."

"Mildred, do help me with this dreadful French," interrupted her little sister, as, standing at Mildred's knee, she slowly spelled out the last lines of La Fontaine's fable of the *Search for Fortune*:

"Fortune, qui nous fait passer devant les yeux
Des dignités, des biens, que jusqu'au bout du monde
On suit, sans que l'effet aux promesses réponde;
Désormais je ne bouge, et ferai cent fois mieux.
En raisonnant de cette sorte,
Et contre la Fortune ayant pris ce conseil,
Il la trouve assise à la porte
De son ami, plongé dans un profond sommeil."

As the child finished the last line Roger came up the steps with a great bouquet of roses in his hand. Looking up suddenly, Mildred caught Mrs. Stanton's eye fixed upon her, with a merry twinkle in its blue depths.

Out came the little dimples round the corners of Mildred's smiling mouth, and a blush that rivaled the crimson of Roger's bouquet drowned the dimples in a flood of rosy red.

ARMY ORGANIZATION.

By GENERAL GEORGE B. M'CLELLAN.

[Second Paper.]

IN the April number we described in a general way the composition and organization of the combatants proper as far up in the scale as the regiment. But in practice it is not enough to furnish men to do the fighting; means must also be provided to supply their wants in garrison and in the field. This is done through the non-combatants, or, as they are often well designated, the administrative branches of the service. But beyond this, something more is required, that is, a body of officers thoroughly instructed in all the details of all the arms of service, and in the working of the administrative branches, well versed in the theory and practice of war, of superior intelligence and activity, whose duty it is to assist the generals in the performance of their difficult duties, to act as their eyes and ears, to transmit their orders and watch over their execution, to relieve them from all matters of mere detail, and to enable them to co-ordinate and control the various elements of the great machine which constitutes a modern army. This body of men is usually designated in Europe as the *Corps of the General Staff*; they furnish the chiefs of staff and their assistants, conduct reconnaissances and similar important work, and act as the immediate advisers of their chiefs; from among their number the generals are largely taken. The duties of these officers are essentially military, and of the highest order, and carry them into the most active participation in

battles. Before we can proceed to put the regiments together into divisions and army corps, we must explain something of the organization and duties of the general staff corps, and of the administrative branches, because they form essential portions of the larger units of force.

We will first take up the subject of

THE ADMINISTRATIVE BRANCHES.

We have already said that their duty is to furnish the combatants with such supplies and assistance as are necessary to enable them to perform their peculiar duties promptly and efficiently. These administrative duties naturally divide themselves into two classes, which differ widely, and require the application of very different arrangements.

1. In peace to supply current wants, and to lay up the reserves required upon the breaking out of war for an increased force and greater expenditure.

2. In war to supply the army from day to day, as it moves and fights.

In time of peace the current wants are in most services comparatively small, and the ordinary means of transportation of the country, such as railways and steamers, usually suffice for the delivery of supplies, which deliveries can then be made for several months or weeks at a time, and in the most convenient season. In time of war not only are the demands immensely increased, but

special means of transportation and delivery must be arranged to accompany the troops on their daily marches. The peace organization must provide for all this, i. e., it must be such as to permit a rapid increase of its *personnel*; measures must be arranged for the maintenance of the reserves of material; those reserves must be ample for the contingency of war; and all the means of rapid and sure transportation, except horses, must be on hand.

No definite and invariable rule can be laid down for this, because the circumstances of the case vary exceedingly in different armies and in different countries. In our own service, for instance, the transportation and supplies for no small part of the army must always be essentially on the war footing, as so many of the troops are constantly in the field, and in regions so remote from the ordinary sources of supply. In a country abounding in large manufactories the reserves of material may naturally be less than in one destitute of such establishments. When an army in its movements can count upon the aid of railways and rivers, the number of wagons may be diminished. But whatever may be the details in any special case, it is a fixed principle that the organization and instruction of these branches of the service should be carefully arranged in time of peace; for discipline and good order are just as essential here as among the combatants, and it must not be forgotten that the duties of the non-combatants often carry them under heavy fire, when cool courage and discipline are indispensable. In some services the officers and employes of these branches are taken directly from civil life; in others to a large extent from the army, or at all events from among those who have served in the army. When circumstances permit, it is certainly well to follow the latter plan. Among the most important supplies are arms and ammunition, food, clothing, equipments, camp and garrison equipage for the men, hospital and medical stores, horses, forage, harness, wagons, saddle equipments, and veterinary stores. The method of procuring these articles varies much in different countries, and even in the same country under different circumstances. In some countries the arms are constructed in the government arsenals, in others by contract, and again in both ways. The Prussians manufacture their own powder; we procure it from private establishments. In some armies the clothing is all obtained by contract, and the requisite alteration made by the company tailors; in many others the cloth alone is contracted for, while it is made up entirely by the troops. So with regard to other supplies. Experience seems to prove that the articles produced by government factories are of a better quality than those contracted for, and that, although the first cost may be

larger, there is usually great economy in the end. On the other hand, when the government encourages private manufacturers, it is rather more certain of obtaining large supplies at short notice. In time of war not only must arrangements be made to supply the daily wants of the troops, but the transportation and care of the sick and wounded must also be provided for. It is not enough to furnish a sufficient amount of supplies, but it is imperative that they should be so well in hand that they can be delivered exactly at the right time and place, and that the trains should be under such perfect control as to interfere as little as possible with the movements of the troops. This implies the necessity of strict discipline and thorough organization, and proves that the European system of employing soldiers (men amenable to military law, disciplined, and instructed in their special duties) in the various duties of non-combatants is far superior to that in vogue with us, of hiring civilians for the duties of train-masters, teamsters, etc., in the quartermasters' trains.

As in regard to the organization of the fighting portion of the army, so in respect of the administrative branches, the Prussian army presents the form best adapted to the explanation of the true principles involved, and we will, as before, make use chiefly of that system by way of illustration. In that service all the administrative branches are under the direct control of the Minister of War. The war ministry is made up of seven principal departments, most of which are again subdivided into sections, each having some particular duty assigned to it. Thus there is one department charged with the general correspondence; another, called the "General War Department," which has supervision of the purely military affairs of the army, such as organization, mobilization, recruiting, drills, etc., etc. There are special sections of this department in charge of the military schools, affairs of military justice, military church affairs, affairs of the artillery, engineers, etc. Another department has charge of the *personnel* of the army, regulating such matters as leaves of absence, transfers, dismissals, promotions, etc. Another department, called "the Department of Military Economy," and subdivided into some four sections, has charge of accounts, money affairs, purchases of forage, rations, wagons, harness, clothing, etc., etc. Another department has the care of the invalids' (old soldiers) establishments; another of all things pertaining to the purchase and care of remount horses; another of medical affairs, including the *personnel* as well as the *materiel* of that department. In addition to these main departments, the directory of the great orphan asylum at Potsdam, the chief commission for the examination of employes of the intendancy, and the general

military chest, are all under the direct control of the war ministry.

Under the direction of the Department of Military Economy there is in each army corps, and in each division, an *intendancy*, which has charge of all matters pertaining to provisions, forage, pay of the troops, garrison, hospital, and camp equipage and stores, transportation trains, equipments, reserves of clothing, etc., etc. Under the orders of the corps intendant is the train battalion, which will presently be described.

THE MEDICAL STAFF.

This is under the supervision of the medical department of the war ministry, at the head of which is the surgeon-general. Each hospital is administered by a commission consisting of one officer of the line, a surgeon, and an inspector.

MILITARY JUSTICE.

The affairs of this department are under the direct supervision of the "General Auditoriat," which is itself immediately responsible to the second section of the General War Department, and has immediate control of the corps, division, garrison, regimental, and battalion auditors (judge-advocates, very nearly), as well as of the various courts-martial and courts of honor.

MILITARY CHURCH AFFAIRS.

There is a Protestant and a Catholic chaplain-general, under whom are all the chaplains, and who are themselves responsible to the second section of the General War Department.

THE TRAIN BATTALIONS.

For each army corps there is a train battalion, which has the immediate charge of the main supply train, and other duties. In peace each battalion consists of 10 officers, 225 non-commissioned officers and men, 121 horses, and 24 wagons. In war the strength is so much increased that as a minimum organization it consists of—

1. Five provision columns, each made up of 2 officers, 1 paymaster, 27 soldiers, 74 train soldiers and mechanics, 1 veterinary surgeon, 164 horses, 32 wagons.

2. Three sanitary detachments, including three detachments of men for carrying the wounded. Each sanitary detachment consists of 3 officers, 1 paymaster, 149 men, 7 surgeons, 46 other persons, 41 horses, 10 wagons, and 15 hand litters, and is organized in two sections, which can serve independently. One detachment is assigned to each division of infantry, and one to the corps artillery. The men detailed to carry the wounded are infantry soldiers, who are instructed in their duties in time of peace.

3. A horse dépôt, with 2 officers, 94 men, 1 wagon, and 170 horses. The object of this

dépôt is only to supply losses among the animals in use among the infantry, pioneers, administration, and head-quarters. In an enemy's country the dépôt is kept up by requisitions. In the field all horses temporarily unserviceable, all supernumerary and captured animals, are turned over to the dépôt.

4. A field bakery column, consisting of 1 officer, 100 bakers, 12 men, 15 horses, and 2 wagons.

5. A train escort squadron, consisting of 6 officers, 116 men, 119 horses, and 1 wagon.

The staff of the train battalion is at the corps head-quarters, and, including this staff, the minimum war strength is 30 officers, 1455 men, 1257 horses, 195 wagons.

Under the commander of the train battalion of a corps are placed all the military *personnel* connected with the administration. In addition to the soldiers composing the train battalions, there are other train soldiers assigned to the troops, as drivers of baggage and ammunition wagons, etc. The average allowance of such wagons for a battalion of infantry is as follows, viz.:

1 Ammunition wagon, drawn by	6 horses.
1 Clothing wagon, drawn by	4 "
1 Medicine cart, drawn by	2 "
1 Officers' baggage wagon, drawn by ...	4 "
With pack-saddles	4 "
Total, 3 wagons, 1 cart, and	20 horses.

The ammunition wagon carries about 18,000 cartridges, and to it are attached 5 picks, 12 axes, 10 spades, etc. The clothing wagon contains the battalion chest, the account-books, some spare clothing, and tailors' and shoe-makers' tools. The officers' baggage wagon contains the portmanteaus of the officers and employés (each lieutenant is allowed 42 pounds, each captain 51 pounds, the battalion commander 94 pounds), the mess apparatus of the staff, the adjutant's papers, and the armorer's tools. The pack-horses—one for each company—carry the officers' mess apparatus and cloaks, 10 blankets for the sick, some tailors' and shoe-makers' tools, the orderly sergeant's papers, and the company money; in all about 200 pounds.

For a battalion of rifles the arrangement is somewhat varied, horse carts being substituted for wagons, to enable them to accompany the command over bad roads and open ground. They have—

4 Ammunition carts, with	8 horses.
4 Baggage carts, with	8 "
1 Medicine cart, with	2 "
1 Staff baggage cart, with	2 "
Pack-horses	4 "
Making 10 carts and	24 horses.

Each ammunition cart carries 7840 cartridges. Including the drivers of the baggage wagons, etc., the total war strength of a battalion of infantry is 22 officers, 1028 men, 34 horses, 4 wagons and carts. Of a rifle battalion the strength is 22 officers, 1034 men, 40 horses, 10 carts. And the total war strength of a regiment of infantry is 69 offi-

cers, 3112 men, 121 horses, 16 wagons and carts.

The baggage of a cavalry regiment consists of—

1 Medicine cart, with.....	2 horses.
1 Forge, with	2 "
4 Baggage carts, with	8 "
1 Officers' baggage cart, with.....	4 "
Or 7 carts and wagons and	16 horses.

Making the total strength of a cavalry regiment on the war footing 23 officers, 653 men, 705 horses, 7 wagons and carts.

It has been already explained that each battery is provided with its own baggage and supply wagons; but, in addition to this, it is upon the artillery that the transportation and supply of ammunition for the guns devolves, as well as for the infantry, beyond the amount carried by the men themselves (80 rounds per man), and that carried in the battalion ammunition wagons (about 25 rounds per man for the line regiments, and about 33 rounds per man for the rifle battalions). There is a regiment of field artillery for each army corps, and when the troops are placed on the war footing, each artillery regiment, in addition to its three divisions of foot artillery and one of horse artillery, forms an ammunition division for the care and transportation of ammunition. This division consists of four infantry ammunition columns, and of five artillery ammunition columns, the whole division counting 20 officers, 1583 men, 1580 horses, 229 wagons. The amount of infantry ammunition carried by the ammunition columns is about 90 rounds per man. The artillery ammunition carried by the columns is about 220 rounds per gun, in addition to the 140 carried in the limbers and caissons of the batteries.

PIONEER TRAINS.

	Officers.	Men.	Horses.	Wagons.
The three field companies of each pioneer battalion have on the war footing.....	15	639	51	9
The light bridge train	2	51	87	13
Intrenching tool column	18	30	6
Total with each army corps..	17	708	168	28

The administration of the army corps on the war footing consists of—

1. The intendency, made up of (a) the corps intendency, 24 persons, 25 horses, 3 wagons; (b) four divisional intendancies, one for each infantry division, one for the corps artillery, and one for the cavalry division, each consisting of 14 persons, 15 horses, 2 wagons.

2. The corps military chest.

3. The subsistence service, made up of (a) the corps subsistence administration, (b) four divisional administrations of subsistence, (c) the administration of the field bakery.

4. The corps medical administration.

5. Twelve field hospitals, each capable of taking care of 200 sick or wounded.

6. Reserve of hospital attendants, etc.*

7. Reserve hospital dépôt.*

8. The field post service.

9. The auditoriat, consisting of (a) the corps judge-advocate, (b) the divisional judge-advocates and assistants.

10. The corps and divisional chaplains and assistants.

The total strength of the administration of an army corps, of course exclusive of the train battalion, is 12 officers, 1055 men, 548 horses, 104 wagons.

THE GENERAL STAFF CORPS.

There is no question that the Prussian general staff corps is the best in the world. It has been for many years under the absolute control of Von Moltke, who has had in his hands, entirely untrammelled, its organization, the selection, instruction, and promotion of its members, and has brought it to its present perfection. To this perfection are due in no small degree the Prussian successes in recent years. To the relative inferiority of their general staff corps their antagonists may to a great extent attribute the disasters they have experienced. In our own last war infinite difficulty, not only in the organization, but also in the subsequent handling of the armies, arose from our lack of such a body of men. So absolutely certain is it that such a corps is of the first and most vital importance in modern war that we must, even if at some length, explain its organization, its duties, and the manner in which its members are selected and instructed. As promotions are practically made, it often happens that general officers, while possessing many of the essential qualifications for command, such as courage, energy, the ability to govern and inspire men, lack other equally important qualities of a more scientific nature, as well as the trained intellectual power necessary to enable them to determine what is best to be done in an emergency, and how to do it. One purpose of the set of men with whom we are now concerned is to supply this want. Again, even when a general possesses all the requisite qualifications for his post, he can not be every where at once, see every thing with his own eyes, or give every order in person, and he requires the assistance of this highly instructed corps to increase his powers of action, for he can see with their eyes, trust to their reports, and commit safely to them not only the delivery of his orders, but also the watching over their proper execution. To such men also he can often safely intrust the power of modifying his orders as circumstances change. Sometimes, also, it hap-

* These are intended to form the main hospitals in rear of the army.

pens that a general has served in only one of the arms of service, and has only a general knowledge of the powers and necessities of the others. Here, too, the general staff corps comes to his aid.

It ought to follow from this, and in practice it often does, that the more perfect the general staff corps, the more frequently will general officers be selected from among their number. In the Prussian army the great majority of the generals have passed through the admirable War Academy, and fully three-fourths have served on the staff; but in most other armies a very large proportion of the generals come from the line of the army. In time of peace the duties of such a corps are twofold: First, to collect and keep in a perfectly convenient shape for immediate use all the information in the way of topography and statistics that, in the event of war, can be useful in arranging plans of campaign and conducting operations. Secondly, to train the members of the corps for the proper performance of their duties in war. The information referred to is so varied and extensive that we can only indicate a few of its main features by way of illustration. One of the most important points is the collection of the best possible maps of one's own and of all other countries where it is possible that campaigns may have to be conducted. These maps should go into every detail, and give ample information on all points that can affect the movements of troops, and must be supplemented by full information—obtained through reconnaissances or otherwise—as to the nature of roads, streams, forests, etc.; the geology of the country, its practicability at all seasons and in all weathers; the capacity of the towns and villages for defense, shelter, supplies, etc.; the nature and location of the defensive positions, and their approaches; similar information in relation to the permanent defenses; the railways, etc., etc. Full information must also be procured in regard to the military resources of all possible antagonists; the organization and strength of their armies; their arrangements for recruiting, etc.; the nature and qualities of their weapons; the character and qualities of their different generals, etc. In regard to the other part of the work in peace, the first step is to select the members from among the most intelligent, active, energetic, ambitious, and high-toned of the entire body of the officers of the army, to institute preliminary examinations into their qualifications, and unhesitatingly to remove from the corps any who at any subsequent period of their service prove to be in any way unsuited to the duties required of them. Next, in regard to their instruction, not only must this embrace all the higher scientific branches of the theory of war, but they must also have constant practice in the performance of their special duties, and serve

so often and so long with troops of all arms of the service as never to lose the habit of command, the knowledge of the necessities and capacities of the men, the details of service with troops, and, more than all, never to cease to identify themselves in thought and feeling with the line of the army, nor become antagonistic to it, and mere office soldiers. It will now appear how, under the master-hand of the chief of staff of the German armies, all these conditions, and more, have been entirely fulfilled. First, let us say that the organization of the Prussian general staff is entirely flexible; its numbers are fixed by no rule—simply by the demands of the service; and its distribution is regulated by the nature of the duties at the moment. The body in question is divided into two portions:

1. The Great General Staff, at Berlin.

2. The General Staff officers serving at the head-quarters of armies, corps, divisions, and with the general inspection of the artillery.

The whole are under Field-Marshal Von Moltke.

The Great General Staff is subdivided into (a) the General Staff proper, consisting of 3 chiefs of division, 6 field officers, and 15 captains; (b) the Secondary General Staff, whose officers are intended for purely scientific purposes, and consist of 4 chiefs of division, 5 field officers, and 12 captains.

The first of these two categories is divided into three divisions, or "theatres of war," each under a chief, as follows:

1. The First Division, which occupies itself with all countries east of Germany, including Austria and Scandinavia.

2. The Second Division, with Germany, Switzerland, and Italy.

3. The Third Division, with all countries to the west of the Second Division.

In respect of the countries to which it is assigned, each division must always possess full information in regard to the organization, strength, and state of preparation of the armies, and all important military considerations, such as resources, communications, peculiarities as a theatre of war, etc., so that immediately upon the breaking out of a war a complete basis for a plan of operations may be ready.

The second category is organized in four divisions, each under a chief, viz.:

4. The Division of Military History, which is occupied in working up the details of past campaigns, so as to make their experience available in the present and future.

5. The Division of Geography and Statistics, with the collection of maps.

6. The Topographical Division, for the survey of the country.

7. The Railway Division.

The number of the general staff officers at the head-quarters of commands varies in peace and war. In war the number assigned

to each army corps is as follows: 1 chief of staff, 1 field officer, 2 captains, 1 field officer or captain with each division.

The number and rank of those assigned to the head-quarters of armies, and with the great general head-quarters, vary according to circumstances.

The duties of the officers attached to head-quarters are, on the one hand, to assist their generals in drawing up and carrying out orders, and on the other, to perform certain office duties.

In addition to the officers proper of the general staff corps, every year some forty officers of the line are detailed for one or two years' service with the staff corps, in order to fit them for the performance of duty as aids-de-camp with the generals.

We can not fully explain the manner in which the candidates for the general staff corps are selected without first alluding to that admirable institution, the War Academy at Berlin. Any lieutenant in the army who has served three years with his regiment as a commissioned officer may present himself as a candidate for admission into the academy. About one hundred and fifty annually offer themselves as candidates, and of this number about fifty are admitted, after a very searching examination. This academy is undoubtedly the best institution of the kind in the world, and is intended to give officers of marked ability and ambition the most thorough instruction in all the higher branches of their profession, and thus fit them for service in the staff corps as aids-de-camp and as generals. Among the branches taught are tactics, strategy, military history, fortification, attack and defense, topography, the duties of the administrative branches, staff service; and in connection with, or as preparatory for, these subjects, pure mathematics, mechanics, chemistry, geology, natural philosophy, general history and literature, and the Russian, French, and English languages. The course lasts three years.

In each year the lectures continue from the beginning of October to the end of June. During the vacations at the close of the first and second years the students return to their regiments to take part in the autumn manœuvres. Toward the end of the second year's course they have several weeks' exercise in practical surveying. At the close of the third year's course they take part with the professors in a "general staff tour," the object of which is to give them practice in making reconnaissances, executing topographical sketches, selecting sites for encampments, positions for troops, etc. They are now all returned to their regiments. From among the graduates some twelve or fifteen of the most able and industrious are usually selected as candidates for the general staff corps. During the year suc-

ceeding their exit from the War Academy these do duty for about eight months with arms of service different from that to which they originally belonged. Those of the number who acquit themselves satisfactorily under this further test are now ordered to the head-quarters of the staff corps at Berlin, where they remain for some two years longer, under the immediate orders and instruction of Von Moltke. During this time they are constantly being taught not only the current duties of the various divisions into which the head-quarters are separated, but they receive lectures from the chief himself, are required to prepare for him reports on various subjects, and accompany him on annual tours for field practice—in short, they still remain at school. They are now again sent back to their regiments, and it is only after the lapse of some months that those finally selected by Von Moltke are definitively appointed captains in the general staff corps, and become members thereof, entitled to wear its uniform. These captains are now assigned to various duties, according to the wants of the service and their respective peculiar qualifications. Most of them are sent to the head-quarters of troops; others go to Berlin. They serve about two and a half years as captains in the staff, and are then returned to duty with the line, receiving command of a battery, squadron, or company, but never with their old regiments. They serve in this way about two years longer, always varying the arm of service, when they are promoted by selection to the rank of major in the staff corps, and resume the duties and uniform thereof. Should any of these staff corps captains during these two years' service with the line manifest any lack of zeal, or in any manner show that the original estimate formed of them was too high, they are quietly left in the line, and lose all opportunity of further employment on the staff. When a major in the staff corps is about to become entitled to his promotion as lieutenant-colonel, before receiving it he must serve at least one year in command of a complete battalion, or of several squadrons, or of several batteries. So, also, before he can be promoted as colonel in the staff, he must command an entire regiment for at least one year.

In addition to the means just described for securing competent officers for the staff, still another method is pursued. The commanders of regiments report to the chief of the general staff whenever they have under their command any subalterns of such superior zeal and intelligence as to render them promising candidates for the general staff corps. To the officers thus indicated the chief of general staff sends military questions and problems to be worked out, and if the replies are such as to indicate that they really possess the requisite qualifica-

tions, they are ordered to report at Berlin, and are there placed on probation. If satisfied of their ability and acquirements, he appoints them on the staff; if otherwise, they return to their regiments. The duties assigned to the officers of the general staff corps are not clerical, all such work being to the greatest possible extent performed by non-commissioned officers and soldiers. In addition to their current and ordinary duties, military questions are constantly given them to study, and every year the staff of each army corps performs a "staff tour," under the direction of its own chief, to keep them in constant practice, and to increase their knowledge of their profession. The officers of the corps at Berlin also make every year, under the personal supervision of the chief himself, a tour of some weeks in the different provinces of the empire. From among the officers of the general staff corps, but more generally from among the other graduates of the War Academy, and from among those who are detailed every year for staff instruction, are selected the aids-de-camp of the generals.

It is difficult to imagine a system which will more effectually carry out the great object in view, which is to select for the staff the very best and most highly instructed of all the officers of the army; and the uniform testimony of those who have enjoyed the opportunities of judging is to the effect that in the Prussian army this object has been most fully accomplished.

We are now ready to describe the composition of the divisions, army corps, etc., but before doing so it is proper to allude to—1st, the four field railway divisions, which are made up to a great extent from the pioneers, and consist each of 4 officers, 230 men, 16 horses, and 2 wagons; these are formed when the army is mobilized for war, and their chief purpose is to repair promptly such railways as may have been rendered impassable in the course of operations; 2d, the four field telegraph divisions, which are also chiefly made up from the pioneers and train soldiers, and consist each of 4 officers, 143 men, 72 horses, and 13 wagons; each division carries some twenty miles of wire, and can prepare for use about one mile of telegraph per hour. The duty of these divisions, aided by other smaller divisions, is to connect the important head-quarters with each other, with important positions, and with the existing telegraph lines, as well as to repair broken lines.

THE BRIGADE.

As heretofore stated, the Prussian infantry brigade consists of two regiments, or six battalions. It is commanded by a major-general or colonel, with a lieutenant as aid-de-camp and adjutant-general. The full war strength of the brigade is 140 officers,

6224 non-commissioned officers and men, 250 horses, and 34 wagons. The rifle battalions are not usually brigaded, but are attached to the army corps, under the direct orders of the corps commander, although sometimes attached to one of the divisions. The cavalry brigade usually consists of three regiments, one of which in time of war is assigned to an infantry division. The brigade staff is the same as for the infantry brigade. In time of peace the artillery brigade consists of the regiment of field artillery and the regiment of fortress artillery belonging to the same army corps, and is commanded by a major-general or colonel, with a lieutenant or third-class captain as aid-de-camp. In time of war the brigade commander is the corps chief of artillery, while the corps reserve artillery, including the ammunition column division, is commanded by the colonel of the field artillery regiment. The brigade staff is in war increased by an additional lieutenant, and has charge of the spare ammunition for all the troops of the army corps. It may be stated here, once for all, that in time of war the staff of each general commanding troops, whether a brigade, division, corps, or army, is increased beyond the regulation allowance by the detail of orderly officers or acting aids-de-camp, usually cavalry officers, according to the necessities of the case.

THE DIVISION.

The normal composition of the division in time of peace is two brigades of infantry and one of cavalry; in war artillery is assigned to it, usually one division of four batteries, or 24 guns, of which 12 are light and 12 heavy. The division staff on the war footing consists of 1 lieutenant-general or major-general as commander, 1 field officer or captain of the general staff corps as divisional chief of staff, 2 captains or lieutenants as aids-de-camp, 2 judge-advocates, 2 chaplains, and 1 inferior officer of the intendancy as divisional chief of that branch. In recent wars the practice seems to have been rather to diminish the amount of cavalry assigned to the infantry divisions, and with the surplus thus gained to form cavalry divisions, which either acted as independent divisions, or were combined as cavalry corps. The composition and staff of a cavalry division do not differ very materially from those of the infantry division. It will thus be seen that the infantry division contains within itself the means of independent action on a respectable scale, made up as it is of the three arms of service in just proportions, and having an administrative service of its own. Its full war strength is about 12,800 infantry, 2000 cavalry, and some 600 artillerists, with 24 guns, or in all somewhat more than 15,000 officers and men, with 24 guns. This force sometimes acts inde-

pends, but in the large armies of modern times it almost always forms part of an army corps.

THE ARMY CORPS.

In the German army this consists of two divisions of infantry, one division or brigade of cavalry, the corps artillery, a battalion of rifles, a battalion of pioneers, the trains, and administration. In time of peace the corps commander has only a general disciplinary control over the artillery, pioneers, and train belonging to it, the instruction of these special arms being regulated from Berlin in order to secure uniformity. In war, however, all the component parts of the army corps come under the direct and absolute control of its commanding general. In other words, during peace, considerations of economy, supplies, and facility of thorough and uniform instruction control, and frequently cause the different arms to be widely separated from each other; while in war tactical considerations are supreme, and draw the different arms close together under a single and absolute head, that they may afford and receive that prompt mutual support which is indispensable. The general principles of the formation of an army corps, and the usual distribution of its parts, will appear from the following table:

B. The 2d Infantry Division.		A. The 1st Infantry Division.	
4th Infantry Brigade.	3d Infantry Brigade.	2d Infantry Brigade.	1st Infantry Brigade.
2 Regiments.	2 Regiments.	2 Regiments.	2 Regiments.
8 Pioneer Companies. 1 Cavalry Regiment. 1 Division Foot Artillery—24 guns.		1 Rifle Battalion. 1 Cavalry Regiment. 1 Division Foot Artillery—24 guns.	
C. Cavalry Division.			
2d Cavalry Brigade.		1st Cavalry Brigade.	
2 Regiments.		2 Regiments.	
Division Horse Artillery, with 2 or 3 Batteries.			
D. Corps Reserve Artillery.			
1 Ammunition Division. 1 Ponton Train (when required by circumstances).		1 Division Foot Artillery—24 guns. 1 to 2 Horse Batteries, consisting of from 6 to 12 guns.	
E. Trains and Administration.			

Total strength—25 battalions, 24 squadrons, 16 batteries, 9 ammunition columns, 3 pioneer companies, 11 trains, and the administration; or in round numbers, inclusive of the ponton train, 930 officers, 38,400 non-commissioned officers and men, 11,900 horses, 96 guns, and 960 wagons, divided as follows:

	Officers.	Men.	Horses.	Guns.	Wagons.
Each Infantry Division	350	15,000	1,900	24	140
The Cavalry Division	110	3,100	3,400	12	60
The Reserve Artillery	60	2,800	2,900	36	340
The Trains and Administration	40	2,200	1,600	..	260

The staff at the head-quarters of an army corps is made up as follows: 1 general or lieutenant-general commanding the corps; 1 field officer of the general staff corps as chief of the staff, and 1 other field officer

and 2 captains of the general staff corps; 4 captains or lieutenants as aids-de-camp; 1 field officer of engineers, assisted by 1 captain and 1 lieutenant of the same arm; the staff of the artillery brigade; the staff of the train battalion; the administration. In addition there is with each army corps head-quarters a detachment of mounted gendarmes, consisting of 1 officer and 44 men. There are also for orderly and guard duty a head-quarters guard, consisting of 1 officer, 50 cavalry soldiers, and 52 infantry soldiers. Of the latter 1 officer, 18 cavalry soldiers, and 28 infantry soldiers are attached to the corps head-quarters; 4 cavalry men and 8 infantry men to each division head-quarters; 2 cavalry men to each brigade head-quarters.

An army corps such as has just been described is really a small army complete in itself, numbering, when the ranks are full, about 36,000 combatants, perfectly prepared for any independent action commensurate with its force, able to move any where, and dependent upon the assistance of other army corps only when it encounters obstacles too great for its unaided strength.

According to recent legislation, the French army is permanently organized in nineteen army corps, i. e., eighteen for France, and one for Algeria. Each army corps consists of two divisions of infantry, one brigade of

cavalry, one brigade of artillery, one battalion of engineer troops, a squadron of the military train, and a proper proportion of the staff and administrative services. The government proposed assigning three divisions of infantry to each corps, which would have made the corps about 50,000 strong;

but after long discussions it was decided to form the corps as given above, so that they have an average strength of about 40,000, which, under the French system, gives an effective force of about 32,000 combatants.

In Russia, also, the organization of army corps is permanent; they consist of three infantry divisions, one cavalry division, and one artillery division.

Within the last two years the Italians have adopted the permanent organization of army corps on the German system, and have reorganized the division, brigade, regiment, and battalion to correspond with the German.

In the war of 1866 the Austrians organized no divisions, but formed the army corps of four brigades, each consisting of two infantry regiments, one rifle battalion, one squadron of cavalry, and one battery of foot artillery. Since that time, however, they have reverted to the division organization.

It has sometimes occurred that cavalry corps consisting of two to three divisions, with a suitable amount of horse artillery, have been formed; but this is not the rule, and is done to meet special circumstances.

ARMIES.

Two or more army corps are united to form an army. The number of armies and the strength of each depend entirely upon the nature of the theatre of war, the proposed plan of campaign, the strength and arrangements of the enemy, etc., etc. For instance, in the war of 1866 the Austrians formed one army to oppose the Italians, and another, under Benedek, to operate against the Prussians. The latter divided into three armies that portion of their forces intended to act against the Austrians, and which was not far from equal in numbers to Benedek's army; while another army and various detachments operated against the Bavarians, Hanoverians, etc., etc. So in the French war of 1870-71 the Germans commenced the campaign in three armies acting conjointly against the French forces scattered from Thionville to Strasburg and Belfort. Later in the war they formed other armies as circumstances required. It is of course to be understood that when two or more armies are acting with a common object, there always is, or at least always should be, a generalissimo, or common head, to direct the general movements of all, and that this directing spirit is close at hand in the field, and not in some distant capital. When an army corps forms part of an army it does not lose its identity, and its commander preserves his absolute and full control over every thing within his corps, the general headquarters of the army, as well as that of "all the armies," confining themselves to giving general instructions and exercising a general supervision.

The command of an army corps such as we have described it is a task which evidently requires experience, ability, and military skill of a much higher order than that needed for the command of a simple division—

qualities which it is not too easy to find in any army. It is evident also that the injurious effects of incompetency in the command of a corps would be much greater than in that of a division, and might quite readily involve the safety of the whole army. In very large armies the formation of army corps would appear to be indispensable, and it is equally imperative that in time of peace no efforts should be spared to provide a sufficient number of competent corps commanders. In armies of moderate size, say of from 75,000 to 80,000 men, the question of organizing corps must depend upon circumstances. If the army is to act, even for a time, on two lines, where the parts will be comparatively independent, and if the commanding general is so fortunate as to possess three or four subordinates of pre-eminent ability and qualifications, it will usually be advisable to form army corps; but if among the division commanders there are none who clearly possess the requisite qualities for the command of a corps, it will be much better to organize the army in divisions, until the right men are found. The mistakes of a division commander may often be rectified, but those of a corps commander are very apt to be fatal. In Europe the commanders of armies and of corps are not selected solely on account of seniority. It may be interesting to state here that under its present organization the field army of the German Empire consists of eighteen corps, including the guards, giving an effective strength of nearly 720,000 officers and men, and that the French field army also consists of eighteen corps, giving a slightly greater effective strength on paper; but the great difference is that while the Germans can in a few days bring into the field the above number of disciplined troops, the French will be unable to do so for several years to come; that is to say, not until their new system has been in operation long enough to enable them to accumulate the requisite reserves of trained troops.

THE RECRUITING OF ARMIES.

On the continent of Europe the ranks are filled by a more or less rigorous conscription. In England and the United States voluntary enlistment is the rule, and conscription, or draft, the exception. Experience has proved that, in modern times, with voluntary enlistment alone it is very difficult and expensive to fill the ranks of an army of any considerable size in time of peace, and quite impossible to accumulate the large reserves of trained soldiers required as soon as war is imminent. This system involves high pay and large bounties, and can, therefore, be employed only by wealthy nations with small armies. It presents, also, the serious disadvantage that in time of peace it does not bring the best material into the ranks. With regard to any particular country, it is

clear that the form of government, the character of the people, and its relations with neighboring powers must decide the method to be adopted for filling the army. Situated as the nations of continental Europe now are, they have no choice but to adopt a system of conscription, and the tendency now is toward the rigorous system of Germany. In Great Britain neither the form of government nor the habits of the people permit the establishment of conscription, although they meet with no little difficulty in maintaining the force required by their situation. We are so happily situated as not to require a large army in ordinary times, and, being separated by an ocean from the great military powers of the world, it is not probable, so long as we remain united among ourselves, that we shall again require armies so large as to render a resort to conscription necessary. This condition of affairs is not the least of the favors that Providence has bestowed upon us. It would have been far otherwise had the war in which we were recently engaged resulted in the disruption of the Union and a division of the country between two great powers; for both sections must then have maintained large standing armies, and submitted to the many evils and sacrifices they entail. Any one who fully comprehends and appreciates the effects of the immense armaments of Europe upon every pursuit and condition of life must acknowledge that the great sacrifices made by the present generation in our country are more than compensated by the blessings which will follow their results through a long future.

In England the term of enlistment is for ten or twelve years. In the United States it is for five years in time of peace, while in war it has been our habit to enlist men for three years, or for the duration of the war. For our present purposes the various systems of conscription may all be classified under two heads: first, the universal conscription, under which all able-bodied men are liable to and actually called upon to render military service during peace as well as war; second, the system under which only a portion of the able-bodied are called out by conscription, and under which those drawn are usually permitted to furnish substitutes.

Russia and Austria come under the second class, for in both the number of men to be drawn by lot each year from among those liable for duty is determined annually by a law or decree based upon the needs of the moment, and in both substitutes are allowed. In Russia the term of service is fifteen years, of which a portion is on leave of absence. In Austria the term is eight years with the active army and two years in the reserve; of the former period the infantry pass two years and three-quarters with their

regiments, the cavalry five years and a half, the special arms four years.

In France the manner of recruiting and the liability to service are now regulated by the law of July, 1872. Every Frenchman fit for service is liable for duty in the regular army or the reserves from the age of twenty to that of forty. Those who have been condemned to any ignominious or disgraceful punishment are excluded from serving in any capacity. Pupils at the Polytechnique and at the Forest schools are allowed to count the time passed there, after they become liable for draft, as so much active service. There are other exceptions (not exemptions) in favor of professors in sundry institutions, and others that we have not space to enumerate. Volunteers for one year are also admitted, essentially as in the German army. Under the law all Frenchmen liable for duty belong to the active army for five years, to the reserve of the active army for four years, to the territorial army for five years, and to the reserve of the territorial army for six years. As the total annual contingent of young men reaching the proper age is too great for the current needs of the active army and the financial resources of the country, only about one-half are drawn by lot for five years' service, while the remainder are to receive from six months to one year's instruction, and then return to their homes, subject to the call of the government. For the present year the second half has not been called out, and the regiments are generally so weak that it is more than doubtful whether the whole of the first half is really in service. Under the new law no substitutes are permitted, but re-enlistments are still allowed.

In Germany alone is the principle of the universal obligation of military service strictly carried out, and even there only since the reorganization of 1859 and 1860.

The members of reigning princely houses are exempt from this liability. Men who are physically incapable of serving as soldiers of the line are nevertheless held to perform such other duties as they are fit for, *e. g.*, tailors and shoe-makers, clerks, hospital attendants, etc., etc. Men who have been convicted of crimes are excluded from the service, as unfit to associate with honorable men.

Every German liable for military duty becomes a member of the standing army upon completing his twentieth year, and so continues for seven years. In peace he serves the first three years with the colors, and the remaining four on the reserve. For the next five years he belongs to the Landwehr, thus making his total service twelve years. No substitutes are permitted; re-enlistments are allowed.

While forming part of the reserve the German soldier is of course liable to be recalled

to his regiment in the event of a mobilization of the army for any purpose; but with this exception he is only held to attend two annual manœuvres, which can not exceed eight weeks each.

While belonging to the Landwehr the infantry soldier is only obliged to attend two manœuvres, of from one to two weeks each, in special companies or battalions of Landwehr. The Landwehr men of the rifles, artillery, pioneers, and train are liable to the same service, but with the regular troops of their own arm. The Landwehr cavalry are not called out for manœuvres in time of peace.

In most of the Continental services during profound peace it is the practice to reduce the expenses of the army by giving a certain number of furloughs to infantry soldiers who have completed their instruction, but not yet finished their full term of service with the colors. In the German army the regular time for the discharge of the contingent of three years' service into the reserve, and for the new contingent to join their regiments, is the 1st of October of each year; but it is usual not to require the infantry men of the new contingent to report until the middle of December, and also to send the men of the third year to the reserve immediately upon the ending of the autumn manœuvres, that is, about the middle of September. The effect of these two measures is to save the pay and rations of one-third of the infantry for three months of each year. To effect a further saving, it has also been customary during the last few years to give temporary furloughs to men of the second year of service; this is done to the extent of five men in each company of infantry, and sixty-four in each battalion of rifles. The class of "volunteers for one year" must not be passed over in silence. Young men of good education, who possess the means of providing for their equipment, food, and clothing, are permitted to present themselves as volunteers for one year. If they pass the necessary examination, they are received as such, and serve for the time specified just as the other men, except that they receive a more rigorous and full instruction. If they pass the examination at the close of the year, they are free from further service with the colors in time of peace, and pass at once into the reserve. From this class many of the officers of the Landwehr are selected. If they fail to pass the examination at the expiration of the year, they lose the benefits of volunteering, and remain on the same footing with the other conscripts.

The effect of this system is to afford great relief to the classes engaged in the learned professions and in important manufacturing and commercial pursuits, while it at the same time provides a large number of capable officers for the Landwehr, and is of benefit to

the army by infusing an additional element of great intelligence and respectability.

The Italians, as well as the French, have of late adopted the system of volunteers for one year.

RECOLLECTIONS OF AN OLD STAGER.

Notices of conspicuous Public Men, with characteristic Anecdotes illustrating their Peculiarities.—Accounts of Congressional and other Duels, and personal Collisions in Congress, including a Glance at Washington Public Life during several Administrations.

ADAMS AND WISE.

THERE was at times such a discrepancy between the language of Mr. Adams and the tone in which he uttered his words that the effect was ludicrous beyond description. On one occasion an onslaught was made upon him by several members, principally from the South. He not only defended himself with surprising skill and vigor, but delivered such blows in return that many of his assailants retired from the conflict staggering under their ponderous weight. But others mixed in the struggle, and it was long maintained, the old gentleman never getting worsted on a single point. When excited his high-pitched voice would break into a screech, that rang through the hall with a piercing sound, resembling the scream of an eagle. "Mr. Speaker," said he, "members may assail my character and decry my motives, they may pervert my language and misrepresent my position; their assaults do not move me in the least: I shall bear them like a lamb" his shrill voice penetrating every recess in the hall.

Mr. Adams had no equal in a controversial debate. He was so thoroughly armed and equipped, and his knowledge was so extensive and exact, that no question ever arose that he was not prepared to discuss in all its bearings. Naturally aggressive, and as courageous as a lion, he never hesitated in attack or defense, and never flinched, even when assailed by any number of the ablest men on the Democratic side. He delighted in raising a storm, and was perfectly cool and self-possessed when it raged with the greatest violence. He was petulant and irascible, frequently interrupting his assailants with passionate ejaculations, and retorting their accusations with crushing effect; but he never lost his balance, or failed in repelling the most damaging assault. In the midst of the wildest excitement and agitation he would rise to address the House. The silence was generally profound. He commenced in low tones, but spoke with such distinctness as to be heard in every part of the hall. His venerable figure had the repose of a statue. His large white head had the smoothness and polish of marble. It was as bald as that of a new-born infant.

As he proceeded he warmed with his subject, and his high, broad forehead began to change in color, streaks of crimson creeping up, one after another, reminding one of a milk-white cloud illumined by lightning, until the whole surface of the head looked as if tinged with blood. When the transformation became complete, his face suffused and his eye flashing, he seemed to increase in size, his tones grew louder and more impressive, his sentences, vituperative and denunciatory, were delivered like round shot, hot and heavy, and those to whom he applied the lash were always to be commiserated. He never forgot an injury, and rarely forgave those who wantonly assailed him. I remember a terrible excommunication which he gave Charles Jared Ingersoll, a member of Congress from Philadelphia. Mr. Ingersoll had held the office of district attorney by the appointment of Mr. Adams, and he turned against him in the campaign of 1828, not only supporting General Jackson with great zeal and earnestness, but abusing Mr. Adams in a spirit of vindictive ferocity. They got into a controversy in the House, which led to a sharp personal altercation. Mr. Adams closed the discussion with a few sentences so charged with pungent sarcasm and just indignation that his victim made no rejoinder, nor ever afterward renewed the attack or attempted any vindication. "The gentleman from Philadelphia knows," said Mr. Adams, "who appointed him to a responsible and lucrative office against the best wishes and best judgment of the best friends of the administration. He knows to whose favor he owed that appointment, when there were many able and distinguished competing candidates. He knows the office was given him out of personal regard, and he knows how he repaid his benefactor."

There was a painful scene on the floor a short time afterward, in which Mr. Adams came in conflict with Wise, Cost Johnson, and several other fire-eaters, who provoked the old gentleman past bearing. The galleries of the House were crowded, Mrs. Wise, an amiable, accomplished, and charming woman, being among the spectators, and her father, the venerable John Sergeant, occupying a seat near Mr. Adams. The subject of dueling came up incidentally, and Mr. Adams improved the occasion to lash with characteristic severity every body who professed to be governed by the code. Referring to the duel in which Cilley lost his life, Mr. Adams said Wise stood there with clots of blood, drawn from the murdered man, on his brow. Johnson interposed with an explanatory observation. "Ha! another duelist!" said Mr. Adams. Wise had said that the tone of the House had got to be disgracefully lowered, that opprobrious language and insulting epithets were exchanged and no demand for satisfaction

made; hard words were common enough, but there was never a fight.

Johnson then got the floor. "Mr. Speaker," said he, "we have heard much of foul language, and nobody held responsible for it. Now I desire to give this House fair monition. If any man on this floor, be he Whig or anti-Whig (always excepting the distinguished and venerable gentleman from Massachusetts, with whom no man can have a personal difficulty), presumes to say what I will do or will not do in a given state of things, if he has any doubt whether I will hold him responsible, let him say one injurious word—nay, let him look an affront—and see whether there will be a fight or not."

Mr. Adams continued his remarks, and such a castigation as the fighting men received at his hands has rarely been inflicted. Wise got the most of it, Mr. Adams having been in the House when Cilley was killed. Wise was humbled and subdued to a degree that had never before been witnessed. He replied with so much feeling, and in such excellent taste, that Mr. Sergeant took him by both hands, and, overcome by emotion, cried like a child.

BARRON AND ADAMS.

The announcement of the death of a sitting member of Congress is always an impressive event; and when the deceased is a man of winning personal attributes, generally esteemed and beloved by his associates, the interest of the scene is much enhanced, and the tributes of admiration and sorrow are so infused with sentiment, pathos, and eloquence that the highest flights of encomiastic oratory are often attained. The most popular and best-beloved men in Congress are frequently not the most distinguished statesmen. Amiability of temper, generosity of disposition, and those qualities which constitute good-fellowship conspire to win affectionate regard in a more profound degree than brilliant intellectual endowments coupled with great achievements in the cabinet or the forum.

Alexander Barron, a Senator from Louisiana, died suddenly in 1848, under peculiarly distressing circumstances. He had hardly passed the prime of his years. He was a man of uncommon personal advantages, of excellent understanding, highly respectable in intellect, thorough culture, of a generous, noble, and manly nature, ample fortune, and fine social position—every thing, in short, to render life desirable. He was the soul of honor, a chivalrous, high-toned gentleman, without an enemy or ill-wisher in Washington.

The more intimate personal friends of Mr. Barron had arranged the order of proceeding upon the announcement of his death, and designated the Senators who were to pronounce the customary eulogies. His col-

league, Mr. Johnson, was of course the proper person to speak first on the mournful occasion. Mr. Crittenden, a warm friend and great admirer of Mr. Barron, was to follow, and then Mr. Webster and Colonel Benton and others were expected to address the Senate. Mr. Johnson performed his allotted task in excellent taste and in a feeling and impressive manner. Mr. Crittenden arose to speak, and after uttering a few sentences was so overcome that he burst into tears, broke down utterly, and sank into his seat. There was a delay of a few seconds, when Mr. Hannegan, of Indiana, sprang to his feet, and poured forth a volume of eloquence and pathos such as had rarely been heard in the chamber. He was a man of fine genius, his mind being filled with beautiful imagery, with the choicest language always at command. He had fallen into irregular habits, and his many friends grieved over the waste of his great powers. He had not been named among the speakers on the occasion, and his wonderful display of oratorical grace and beauty was evidently made without premeditation. The effect was marvelous. Nearly all the Senators were in tears, many of them sobbing and crying like children in uncontrollable emotion, and the large auditory crowding the galleries and lobbies of the Senate was profoundly affected. Mr. Webster and Colonel Benton subsequently spoke with their accustomed power and effect. Altogether it was a scene not to be forgotten.

Mr. Adams was stricken down in the hall of the House of Representatives, the scene of his greatest intellectual achievements, and he died with his harness on. His death was mourned as a national bereavement, the most distinguished men in Congress, without distinction of party, testifying their respect and admiration of his character and vast public services. Governor M'Dowell, then a member of Congress from Virginia, delivered a eulogy upon him remarkable for its high finish and just appreciation of his great abilities and the purity of his life. Colonel Benton, at the request of the Massachusetts delegation—Mr. Webster then suffering from domestic affliction—spoke at length in commendation of the eminent and patriotic services and the pure and exalted character of the illustrious dead. I transcribe a brief paragraph from his superb eulogy as a fitting conclusion of this notice of the manner in which Congress was wont to do honor to the memory of those who died in the legislative service of the nation:

"In the observance of all the proprieties of life Mr. Adams was a most noble and impressive example. He cultivated the minor as well as the greater virtues. Wherever his presence could give aid and countenance to what was useful and honorable to man, there he was. In the exercises of the school and the college, in the meritorious meetings

of the agricultural, mechanical, and commercial societies, in attendance upon Divine worship, he gave the punctual attendance rarely seen but in those who are free from the weight of public cares."

TEXAS SENATORS.

The first Senators from Texas were strong, able men. There was hardly a State in the Union better represented in the body. General Houston had been in the House, from Tennessee, many years before. He was not a man of much early culture, but he had fine faculties, and adapted himself to his position with great facility. His excellent common-sense qualified him for his duties as a legislator, and he soon came to exert a large and wholesome influence on public affairs. He had a quick, apprehensive mind, saw intuitively the strong points of a case, was a direct, forcible debater, and was generally on the right side of every question. He was always listened to with attention, and while he rarely spoke for effect, and presented his views in perspicuous, nervous language, he impressed himself upon current legislation with uncommon power.

His colleague, General Rusk, was of a broader intellectual structure. He was a new man in Congress, but his well-balanced mind, comprehensive intelligence, excellent judgment, upright and patriotic intentions, gave him a high rank in the Senate. Mr. Webster regarded him as the ablest man on the Democratic side. He was liberal and catholic in his views, and although representing a Southern State, uniformly commanded the confidence and respect of his associates from every section of the country. He was a truly national man, and his fine talents and sound conservative notions, with his amiable deportment and conciliatory manners, would have given him a position of great importance in the sectional controversy that sprung up soon after his decease. His untimely death was an irreparable loss to the Democratic party, in which the nation was largely a sufferer. If he had lived to have been made the Presidential candidate in 1856 instead of Mr. Buchanan, it is safe to assume that the rupture between the North and South, which was precipitated by the timidity and infirmity of purpose of the President, would have been postponed for many years. The strong will and vigorous brain of General Rusk would have done much to allay sectional agitation. A Southern man, he would have laid his powerful hand upon the factious elements that convulsed the slave-holding States, while the North would have had full confidence in his honesty, patriotism, and unerring sagacity.

HOUSTON REPRIMANDED.

The solemn farce of reprimanding a man at the bar of the House as a punishment for

a breach of the privileges of the body was performed in the case of Sam Houston, Andrew Stevenson being Speaker. Houston had been charged by Stanberry, a member from Ohio, with defrauding the government in some transaction with an Indian tribe on the Tennessee border. An investigation was requested, but Houston could get no satisfaction, and not willing to rest under the imputation, he inflicted a severe chastisement with a cane in the precincts of the Capitol. Houston was arrested by the sergeant-at-arms, and there was a long trial, resulting in a resolution that the offender should be reprimanded by the Speaker. It was a curious spectacle. Houston was at that time a striking specimen of manly beauty. He was in the prime of life, with more personal advantages than almost any man of his time. He stood considerably above six feet, with small hands and feet, and every way finely proportioned. He was dressed in faultless style when the sergeant-at-arms led him up to the bar of the House. He was perfectly self-possessed, easy and graceful in manner, without swagger or self-assertion, with the bearing of a man who came there to pay his respects to the House, and specially to its presiding officer. The galleries were crowded, and the members, with the spectators, looked curiously on. Speaker Stevenson was the only embarrassed person in the hall. He was a large, fine-looking man, of commanding presence; but he was fidgety and uncomfortable, looking as if he expected Houston to read him a lecture. In a hesitating and perturbed manner he told Houston that the House had ordered him to be reprimanded by its presiding officer, and he, the Speaker, begged him to consider himself reprimanded. Houston bowed in a graceful, dignified, and lordly way, a broad grin spread over the House, and there the matter ended. The Democrats had a clear majority in Congress, and Houston belonged to that party, but the breach of privilege was too flagrant to be overlooked. Still the dignity of the body was not vindicated by the Speaker's reprimand.

The life of Houston has yet to be worthily written. A more adventurous and checkered career was never run by an American. He was affianced in early life to an accomplished and charming lady, and before the consummation of the marriage he fled from his home and civilization, and sought refuge with the Chickasaw tribe of Indians. There he remained for more than two years, conforming to the habits and modes of life of the Indians. He was adopted into the tribe, and chosen a chief, and was said to have exerted a very wholesome influence upon the savages. There was a mystery surrounding his abandoning the lady to whom he was contracted in wedlock that was never so fully solved as to satisfy the curiosity of his

Tennessee neighbors. He never spoke on the subject or allowed his acquaintances to interrogate him, and as he was not a man to be safely affronted, care was taken to avoid all allusion to it in his presence. The truth is, the lady was attached to another gentleman, whom her friends would not permit her to marry, and they persuaded or constrained her to contract an alliance with Houston. She stated the facts to him at the last moment, appealing to his forbearance and generosity to spare her the pain of the connection. Houston was full of chivalry and delicate tenderness, and he took the most effective mode of relieving her. But the affair tinged his whole life. He never forgot her, and much of the eccentricity and waywardness that marked his conduct after he went to Texas, and as long as he lived, was the result of this pathetic incident.

A man of strong frame and steady nerves, Houston was almost necessarily brave and indifferent to personal consequences. But he had none of that chivalric intrepidity which prompts a man to seek danger for the love of excitement. He was valiant upon calculation, and living in a half-civilized region where every man was held personally responsible for his conduct, he fought without hesitation when he had more to gain than lose by that course. He would fight or not just as he pleased, and no threats of posting as a coward or of personal chastisement had the slightest influence with him. When challenged by Dr. Green, of Galveston, he declined to accept, because, he said, he would not "fight down hill." When Governor Jones sent him a hostile message, he refused peremptorily. Jones threatened to post him. Houston replied that if he thought he could persuade the people of Texas to believe him a coward, he was welcome to make the experiment; and as to assaulting him personally, he was sure the Governor was too prudent a man to engage in any such enterprise.

To what extent Texas was indebted to General Houston has never been authoritatively settled. The great battle of San Jacinto was fought under his direction, but his associates were some of them very able men. General Rusk, who served so long with him in the Senate, was a man of uncommon parts both as a soldier and a statesman. He had few superiors in the country, and but for his premature death would have attained still higher distinction. He was a great favorite at Washington, and highly esteemed by all who had the pleasure of his acquaintance.

Houston never lost his popularity in Texas until the rebellion broke out. He was too patriotic to go with his people on that question, and his life was shortened by his efforts to withstand the storm that swept the State like a tornado.

DROMGOOLE.

George M. Dromgoole, of Virginia, was a man of mark in the House during a service of several years. He was a capital debater, an expert parliamentarian, of a subtle, acute mind, and when bent on mischief was sure to puzzle and embarrass the most self-possessed and experienced presiding officer. He entered upon the active duties of life under circumstances promising a distinguished career. But having the misfortune to kill an antagonist in a duel when quite a young man, his future existence was one prolonged misery and wretchedness. His victim was a neighbor named Dugger—a respectable man in position and character, but of a quarrelsome disposition and vindictive temper. The difficulty grew out of a trifling altercation, Dugger being the challenger. Poor Dromgoole tried by every honorable means to avoid a combat, even going so far as to leave the State, while mutual friends endeavored to adjust the quarrel; but all in vain. Dugger insisted upon a meeting, and he fell at the first fire.

Dromgoole was never the same man afterward. To drown his remorse he took to drink, and killed himself by intemperance before reaching middle age. He had fine reasoning faculties, and he often spoke with great power and effect when he could hardly steady himself on his legs. He was as well skilled in the rules of the House as any man in it; and if not more than half-seas-over, was almost certain to get the best of a squabble on a point of order. His colleague, Hunter, who was Speaker of the Twenty-sixth Congress, always dreaded to see him mix in a controversial debate. Right or wrong, he was wholly unmanageable, and most of the members were careful not to provoke a controversy with him.

He had a violent attack of delirium after a protracted debauch, and on his recovery resolved to lead a different life; but the enemy was too strong for him. He described his visions and sensations and the images that haunted him while in that state in a strain of eloquence and pathos unsurpassed by any thing De Quincey ever wrote.

Four gentlemen were playing a game of whist one evening at Mrs. Whitwell's boarding-house, in Duff Green's row, east of the Capitol grounds. Dromgoole had his quarters at Mrs. Omner's at the other end of the block. By mistake he went to Mrs. Whitwell's, and insisted upon going in. The servant remonstrated with him, but without effect. Presently the landlady came to the door and tried her persuasive powers. Meantime the poor fellow had seated himself on the steps, determined, as he said, to enter his own domicile. The whist-players were in a parlor on the first floor. It was a warm night, the windows were up, and every word of the conversation was audible to them.

Mrs. Whitwell had sent for a policeman, and he was endeavoring to persuade Dromgoole to be taken to his lodgings, threatening to arrest him unless he consented. Dromgoole remonstrated with the officer, and the whist-players suspended their game to listen to the colloquy. "Policeman," said he, in a magisterial tone, "I know your duties, and I know my rights. If I am drunk, making a noise in the street, you have authority to take me up: I am drunk, but I'm as quiet as a Congregational deacon. If I am drunk, lying in the gutter, you are warranted in removing me: I'm drunk, but I'm not lying in the gutter, as you see. Lay a hand on me, Mr. Officer, and I will make it a case of privilege in the House to-morrow." The whist-players burst into a laugh, Senator Bates exclaiming, "Logical always, drunk or sober."

APOCALYPSE SMYTHE.

There were more strange, eccentric men in public life fifty years ago than we see at the present day. Virginia always sent her quota of this class of representatives. Among the more conspicuous of the nondescripts was Alexander Smythe, well known on the Canadian frontier during the war of 1812. He commanded a body of troops on the border, and being an impatient, irascible man, had a difficulty with General Peter B. Porter, who was Secretary of War under John Quincy Adams. A duel was arranged, but the quarrel was finally adjusted without a meeting. They were to have fought on Strawberry Island, a little patch of land covered with reeds and marine grasses a short distance below Buffalo, in the Niagara River, hardly visible in a high stage of water, and never solid enough to afford a good foot-hold. It was not known how the affair was settled; but Porter, who was always cocked and primed for a fight, went on to the ground at the time appointed, and was much disgusted at the non-appearance of his antagonist. It was not supposed that Smythe was deficient in courage, but at the last moment he made up his mind that it was ridiculous to fight a duel.

He was a gentleman of studious habits, and was filled with useless learning. He had written an ingenious book on the Apocalypse, in which there was an extraordinary exhibition of Biblical research. He broached a new theory respecting the interpretation of certain mystical portions of the Scriptures, and the wags of the House nicknamed him accordingly. General Smythe called Rollin C. Mallory, of Vermont, to order for some irregularity in debate. Mallory took his seat, grumbling in an audible voice. He said he would not object to being pulled up by any staid, orderly, respectable member, but it was too bad that such a liberty should be taken with him by one of the

monsters described in the Bible, having seven heads and ten horns.

On one occasion Smythe began a speech in the House on certain proposed amendments to the Constitution, which threatened to be interminable. He had spoken for parts of three days, the discussion taking a very wide range, when Mr. Livermore interrupted him by inquiring of the Speaker what was the question before the House. The Speaker said the gentleman from Virginia had the floor, and it was expected that he would proceed in order. "Mr. Speaker," said Mr. Smythe, "I am not speaking to this House, nor to this generation; I am speaking for posterity." "Mr. Speaker," said Livermore, "let the gentleman continue for a while longer, and he may expect his audience to be present to hear him."

GOVERNOR REYNOLDS OF ILLINOIS.

There is nothing in the history of the country which so strikingly exhibits the material growth and expanding political power of a State as the wonderful increase in the wealth and population of Illinois. Long after the writer of these sketches had arrived at his majority the State had but a single member in the House of Representatives. It was beyond the limits of civilization, reached only after a wearisome journey of many weeks, unknown to the Atlantic States. Chicago, which before the late fire was larger than New York was then, consisted of a block-house and the hamlets of a handful of Indian traders. Now Illinois is the fourth State in the Union in point of population, and has the elements of national wealth to an extent unsurpassed by any of her sister commonwealths. She is treading close upon the heels of Ohio, and will pass her at the next enumeration of the people. When Illinois had but a single member of Congress Virginia had eighteen; and now the Old Dominion has only half the federal strength of the giant of the West.

Some thirty odd years ago Illinois sent an uncouth, illiterate man to Congress named Reynolds. He had a strong vein of commonsense, much natural shrewdness, with some comic humor. He had been Governor of the State, and Fund Commissioner, and seemed to have been uncommonly popular with his people. At that time Illinois was a frontier State, sparsely populated, deficient in the means of education, without refinement or much culture of any kind. Mr. Reynolds spoke frequently, always provoking merriment, in which he joined, without caring, apparently, whether the House was laughing with him or at him. His phraseology was tinged with the oddities and quaintness of a backwoodsman. Every body was his "worthy friend." In opposing an appropriation for the navy he provoked the satire of Mr. Winthrop, of Boston, always one of the most

courteous of men. He spoke of the want of appreciation of the usefulness and necessity of a respectable armed force for the water so often betrayed by Western men. Mr. Reynolds rejoined: "My worthy friend from Boston does me wrong in saying I'm agin the navy. On the contrary, I love and admire the navy. Didn't our gallant sailors win unperishable honors in fighting our worthy friends, the British, in the last war? Didn't them dashing young fellows, Perry and Macdonough, drive a hostile flag from off the great lakes, and make the British lion put his tail between his legs?"

Visiting Baltimore soon after he came to Congress, he was amazed at many things he saw. The size of the city bewildered him, and the crowd of people in the streets nearly drove him wild. Passing down Pratt Street early in the morning, he came to the Patapsco at the time when the tide was running strong flood, it being nearly high water. Some six hours afterward he took another look at the river, when it was almost low tide. This rather puzzled him, so toward night he made another visit to the wharves, and found the tide coming in again. This was too much for him. "Dang me," said he, "if this don't beat all my calculations—two freshes in one day, and nary a drop of rain!"

Going to New York for the first time on business connected with the duties of his office as Fund Commissioner, he put up at the Astor House. Such things as gas and bell-ropes were far beyond his comprehension. Lying on the bed, there being a brilliant light in the room, he began playing with the bell handle, and finding it to yield on pulling, he gave it a vigorous jerk. It was responded to immediately. "What did you wish, Sir?" "Nothing at all. Come in. I'm glad to see you. Take a seat. I was getting to feel sort of lonesome." The waiter, slightly astonished, sat down without a word. The Governor had taken off his boots, and John Thomas took them out to be polished without attracting the attention of the Fund Commissioner. After repeated efforts to blow out the gas, and finding it impossible, he went to bed.

In the morning he missed his boots. Rushing into the hall, half undressed, he shouted and shrieked until he brought up one of the proprietors, a clerk or two, and no end of waiters. "My boots is stole! my boots is stole!" He was asked what kind of boots he wore. "Number thirteen," he screamed, "and pegged at that."

WIGFALL AND KING.

Angry controversies and personal altercations are constantly taking place in Congress, but they rarely have any results out of the Capitol. Men of hot passions forget themselves, and indulge in opprobrious lan-

guage, which is promptly retorted, sometimes with increasing vehemence; but the excitement passes off, and the affair usually terminates without leaving a sting behind. An instance of this kind may be worth describing by way of illustration.

A sharp dispute sprang up in the Senate one day on a matter of small importance, growing out of a misunderstanding between Wigfall of Texas and Preston King. Wigfall was a hot-tempered man, who had been engaged in several quarrels, a resort to arms being his favorite mode of adjusting a personal difficulty. King was full of pluck, and he retorted the intemperate language of Wigfall with so much spirit that a duel seemed probable. A New York friend of King was in the Senate at the time, and thinking the services of an expert in the matter of fighting might be required, he called at King's quarters in the evening to tender his assistance. A servant took his name to the Senator, and he was invited to walk up. He found a party of gentlemen playing draw poker. In a corner of the room stood a table containing a demijohn, decanters, a pitcher, and glasses. He was introduced to each of the players as he was not acquainted with. They nodded and kept on with the game. His apprehensions were promptly allayed on observing that the only gentlemen present who had their coats off were Senators Wigfall and Preston King.

Pre-existing bad blood, as in the case of Mr. Clay and Senator King of Alabama, exacerbates the angry feeling arising from a dispute, trifling in its nature, and sometimes leads to serious consequences; but a fresh dispute, even when animated and embittered, is easily adjusted when there is no outside interference.

MANGUM AND MARSHALL.

Among the honest, wise, and able men who adorned the Senate in its best days there was none more popular or highly esteemed than Willie P. Mangum. As a legislator he was national, just, and patriotic, sound in judgment, convincing in debate; independent and high-toned, he was above the reach of all sinister influences. He presided in the Senate for many years, after the death of Mr. Southard, and such was the confidence of the Democrats in his fairness and impartiality that they repeatedly requested him to name the members of the minority of the committees of the Senate when the Whigs were in power; and this delicate task he performed in such a manner as to give general satisfaction.

On the election of Mr. Polk Mr. Mangum gave indignant utterance to his apprehensions of the ultimate consequences of choosing inferior men to the Presidency. He spoke in eloquent terms, deprecating the precedent as fraught with peril to the per-

manence, and certainly the respectability, of the government. The experience of the country has demonstrated the prescience that dictated his gloomy forebodings.

A genial, hearty, and amiable gentleman, his good offices were always at the service of his friends. He was inclined to conviviality, loved fun, told a capital story, and was beloved by every body. Tom Marshall at one time indulged in such excesses that his friends became alarmed, and determined to make an effort to reclaim him. Mr. Mangum was designated to remonstrate with the wild Kentuckian, and endeavor to impress him with a proper sense of the peril of his position.

"I'll hear any thing you have to say, Mangum," said Marshall, as the Senator opened the conversation.

"Your friends have been greatly concerned at the manner in which you have been conducting yourself."

"Don't wonder at it. Been badly bothered myself. Sent you here to talk with me, didn't they?"

"Yes; they thought as I sometimes take a glass myself, my advice would have the more effect."

"You do drink too much, Mangum. I've been thinking of speaking to you on the subject. But what do you want me to do?"

"Your friends have the greatest admiration for your genius and talents. They are confident that with sobriety and application you might reasonably aspire to the highest place under the government."

"What do you think I could get?"

"I have no doubt you might be made Chief Justice of the United States."

"There's been one Chief Justice in my family; I don't care to follow him."

"You might even hope to become President."

"No great credit to follow Captain Tyler. But I tell you what I'll do, Mangum: you make me President of the United States, and if I don't make you Secretary of State I'll agree to be —d! Let's take a drink."

SCHENCK AND JOHNSON.

There was always a lively sense of the ludicrous and an exquisite enjoyment of fun and mischief in the House that no notion of dignity or propriety could control. Venerable legislators, usually grave and solemn in the discharge of their duties, relished the pranks of the young and volatile, and the hall would ring with laughter when the peculiarities of members were made the subject of harmless ridicule. Mr. Schenck, our present minister in London, was a wag of inimitable drollery, and he often threw the House into a roar by trotting out Andy Johnson, who had no idea of a joke, and was always in dead earnest on the floor. Johnson often spoke, and never without

careful preparation. He made formal set speeches, and was sadly embarrassed by interruptions in his early Congressional days. Schenck, who was ready, prompt, and quick at repartee, with his resources all at command, had no sympathy with those who read their orations, and were not apt in controversial discussion. He created great diversion by bothering Johnson, and whenever the future President undertook to enlighten the House by his lucubrations, Schenck was sure to take a seat near him, his sharp eyes twinkling with mischief, ready to take advantage of any opening for diverting Johnson from the subject upon which he was speaking. The attention of the House was immediately attracted to the scene, and the fun soon began. Schenck would address

some apparently harmless interrogatory to Johnson, who would generally make an irrelevant and bungling reply. His tormentor would follow up the attack by further leading questions, until Johnson would admit himself out of court, without penetrating the design of Schenck. By this time the subject under discussion would be lost sight of, and the two gentlemen engaged in a familiar conversation. Then a confederate of Schenck would gravely inquire of the Speaker, "What is the question before the House?" "The member from Tennessee has the floor," would be the answer, amidst general laughter. Johnson would apologize, and proceed with the reading of his essay, while Schenck would withdraw, to repeat the joke the next time Johnson had the floor.

MY MOTHER AND I.

A Love-Story for Girls.

BY THE AUTHOR OF "JOHN HALIFAX, GENTLEMAN."

CHAPTER XI.

I HAD wished, in telling my story, to speak as little as possible of myself and my feelings, but it is difficult to avoid it, so vividly do I still recall the emotions of that time.

If I were asked at what period of a woman's life she is capable of the intensest love, the sharpest grief, I should say it was in her teens, when she is supposed too young to understand either, and late in life, when people think she ought to have done with both. Chiefly because, when young, we can scarcely take in the future; when old, we know that for us the future exists no more. Therefore

I am much more sorry for girls and middle-aged women, when "in love," as the phrase is, than I am for those in the prime of life, to whom that very fact brings strength and compensation.

Falling asleep that night—or rather next morning, for it was daylight before I lost consciousness of myself and what had happened to me within those thirty-six hours—I was a changed creature. Not a miserable creature at all, not in the least broken-hearted, only changed.

I knew now that for me woman's natural lot, to which my mother looked innocently forward, was not to be. I should never marry, never give her the grandchildren that she used to laugh about, or the son-in-law that was to be the staff of her old age. For me, and for her through me, these felicities were quite at an end. Yet I did not grieve. I felt rather a kind of solemn contentment, a peaceful acceptance of every thing; my lot, if not happy in the ordinary sense, would be very blessed, for I should never lose him; he would never marry; nobody was likely ever to be a nearer friend to him than I. And I might, in my own humble way, come very near to him. The chances of life were so many that to a faithful heart, continually on the watch to do him good or to be of use to him, innumerable opportunities might arise. Nay, even if I were quite passive, never able to do any thing for him, I might still watch him from a distance, glory in his goodness, sympathize in his cares, and feel that I belonged to him, in some far-off way that nobody knew of, to the end of my days.

That sad word he had let fall about the end of his days being so uncertain, did not affect me much. At my age, to one who has never come near it, death seems merely a

phantom, often more beautiful than sad—a shadow that may fall upon others, but does not touch ourselves. To me, with my heart full of new-born love, death seemed a thing unnatural and impossible. I never remember thinking of him and it together, no more than if he had been immortal, as to me he truly was.

Thus, after our conversation that night, I was quite happy, happier than I had ever been in my life before. My feeling was, in a dim sort of way, almost that of a person betrothed, betrothed to some one who had gone to a far country, or whom she could not possibly marry; yet having a sense of settled peace such as girls never have whose hearts are empty and their destinies uncertain. Mine was, I believed, fixed forever; I had no need to trouble about it any more.

And though I was so young, not yet eighteen, what did it matter? My grandmother was married at eighteen. So, in a sense, was I. I took one of my mother's rings (the very few she possessed she had given me when I left her) and placed it on the third finger: now nobody need attempt to marry me any more.

Three days passed by—three perfectly quiet days. My grandfather was not well, and kept his rooms. Mrs. Rix never said a word to me about Sir Thomas Appleton, or any thing. She was a little distant and cold, as if I had somehow done a foolish or naughty thing, and thereby made myself of much less value than I was a few days before; but that was all the difference I found in her. It was Cousin Conrad, I knew, who had smoothed matters down for me, even when absent, though how he managed it I never knew.

The letter I had expected from my mother did not come, nor she herself either. It surprises me now to remember how calmly I took this, and how easily I satisfied myself that, being quite unaware of the reason she had been sent for, she was waiting patiently till my grandfather sent for her again. Also, though I watched the post daily with an anxiety that I tried hard to conceal, it was not entirely for my mother's letters.

Cousin Conrad had said that he should probably send me a line from London. A letter from him—a bit of his own handwriting, and for me! No wonder I waited for it, and rejoiced in it, when it came, with a joy the reflected shadow of which lingers even now.

The merest line it was:

"DEAR COUSIN ELMA,—Tell your mother I have procured the books she wanted, and hope to bring them to her next week, if she is not with you, as I trust she is. No more, for I am very busy, but always

"Your affectionate friend,

"CONRAD PICARDY."

My "affectionate friend!" It was enough—enough to make my life happy until the end. So I believed then; perhaps I do still. The heart of life is the love that is in it, and the worthiness of the person loved.

I wrote to my mother, giving Cousin Conrad's message, and scolding her gayly for not having come or written. I said, if she did not appear to-morrow, I should most certainly come and see her. Only come and see her; I did not suggest coming home for good. I reasoned with myself it would be so very much better for her to come here.

All my happy dreams revived, all my plans concerning her and him, and how they would care for one another, and I for them both. As to myself, I must try to make myself worth caring for; try to cultivate my mind, and even to make the most of my outside beauty, which he had told me I "despised." He did not; he liked beautiful people, and owned it. Was not Agnes beautiful, and, as Mrs. Rix once said, just a little like me?

Once or twice, by ingeniously guiding the conversation, I had got Mrs. Rix to talk of Agnes; for I loved her almost as if she had been alive—loved them both together, for, in a human sense, both were equally distant from me—distant, yet so near! The thought of him was now never absent from me for a single minute, not displacing other thoughts, but accompanying them like an under-current of singing birds or murmuring streams; or, rather, it was most like what I have heard nursing mothers say when they went to sleep with a baby in their arms: they were never afraid either of harming or forgetting it, because, waking or sleeping, they were always conscious it was there. So was I. My last sigh of prayer at night was for him; my first feeling in the morning was how bright and happy the world seemed, since he was in it! A world without him, a day in which I could not wake up to the thought of him, appeared now incredible and impossible.

I know there are those who will smile, and call such a love, such a worship rather, equally incredible and impossible. I do not argue the point. That it was a truth my life has proved.

The third day after that day so full of startling pain, yet ending in solemn content, I was sitting peacefully sewing in my bedroom, whither, on any excuse, I was glad to creep. To be alone was the greatest bliss I knew. My watch, ticking on the table beside me, was the only sound that broke the quietness. I looked tenderly at its pretty white face, and thought of Cousin Conrad's mother, and what a happy woman she must have been, and how I would have loved her had I known her.

Then seeing it was near post-time, I listened, but not anxiously. It was unlikely he would write again before he came back on the following Wednesday, three days

hence. Then he would be sure to come. One of his characteristics was exceeding punctuality and dependableness. If he had promised to do a certain thing at a certain time, you might rely upon him that no whim, no fancy, no variable change of plan, nothing, in short, but inevitable necessity, would prevent his doing it. Down to the smallest trifles, he was the most conscientious person I ever knew. Once when I told him so he laughed, and said "life was so full of work that if one did not take some trouble to make it all fit in together, like the wheels of a watch, the whole machinery soon went wrong."

But I am wandering from my actual story—wandering away to linger over this picture of a perfect life. For his was an almost perfect life. Some women's destiny is to love down, excusingly, pityingly. Thank God! mine was to love up.

I sat thinking of him, and wondering how he had settled that troublesome business in London which he had told me of—other people's business, of course—sat as happy as I could be, as unconscious of the footstep of coming sorrow as (mercifully, I often think) we generally are until it knocks at our very door. Thus, for the second time, under Mrs. Rix's fingers it knocked at mine.

"Come down at once to the General; he has got a letter."

"From my mother?" But though I said "my mother," I thought not of her alone, and if I turned sick with dread, my fear was not wholly on her account.

"No, my poor dear girl, not exactly your mother. The doctor—"

"Oh, she is ill! she is ill!" And pushing Mrs. Rix aside, I ran down stairs like lightning, and burst into my grandfather's room. He gave me the letter at once.

My darling mother! Her week of silence, her not coming to Bath, as well as her anxiety to prevent my coming home, were now fully accounted for. Small-pox had been very much about in the village, and at last she had caught it—not dangerously; the doctor said hers was a mild case; still she had been very ill, and it would be some time yet before she was able to write. He wrote, by her desire, to my grandfather, explaining all, and entreating that I should be kept from coming to her. She had all the care she needed—himself, Mrs. Golding, and a hospital nurse—and nothing must be risked for her child. On no account was I to come near her.

"Cruel! cruel!" sobbed I, till I met my grandfather's look of amazement. "No, it is not cruel; it is just like herself—just what she always told me she would do in such a case. She used to say that she should have lived alone but for me, and she could die alone, even without one sight of me, rather than harm me. Oh, mother! mother!"

I think my grandfather was touched, and that if he bore any grudge against me in the matter of Sir Thomas, he forgot it now. His tone and manner were extremely kind.

"Comfort yourself, my dear. You see all has gone well so far; Mrs. Picardy is apparently out of danger, and no doubt will soon be convalescent. She was quite right to act as she did. I respect her for it, and shall tell the doctor so, desiring him to pay her all attention, and send news of her every day."

"News every day!" For in spite of all my mother's prohibitions I had no thought but how fast I could get ready, and imploring for once to have the carriage, go home immediately.

"Yes, every day, or every other day, as he says it is a mild case," continued my grandfather, looking a little wearied of my tears. "And if Mrs. Rix could suggest anything to send her—wine or jelly, perhaps—provided we run no risk of infection. Pardon me, but I have a great horror of small-pox. In my young days it was an actual scourge. Two young ladies I knew had their prospects blighted for life by it; but your excellent mother is neither very young nor—"

"She is beautiful—beautiful to me!" cried I, indignantly. "She is every thing that is sweet and precious to me. Oh, if she had only told me she was ill—if I could have gone to her days ago!"

"You do not mean to say you are going now?"

Had I meant it? I can not tell. I was silent.

"Such a step," my grandfather continued, "would be most imprudent. She herself forbids it, and I respect her for doing so. You could not benefit her, and you might destroy your prospects for life."

Destroy my prospects for life! Probably because he too considered that my face was my fortune, and the small-pox might spoil me and prevent my being married by some other Sir Thomas Appleton! That thought settled my mind at once.

I said, with a quietness that surprised myself, considering the storm of grief and rage within me, "I do not care for my prospects. Since it is for my sake only that my mother forbids my going to her, I mean to disobey her, and go."

Then, for the first time, I saw what my grandfather could be when he was contradicted. Peace be to him! I had rather not remember any thing he said, nor recall the expression of his noble and handsome old face as I saw it just then. He must, as I found out afterward, have built many hopes and plans upon poor me, the last of his direct line, and it was hard to have them disappointed.

"You will understand one thing," said he at last, his wrath turning from a red into a

white heat, equally powerful and more dangerous, "when you quit this house against my will, you quit it forever. All that I mean to give you I shall leave to your cousin Conrad. You hear me?"

"Oh yes!" And I was so glad—glad that he should have all, and I nothing, that in any way my loss should be his gain. But the next minute I heard something more.

"Now, Elma, I will detain you no longer. If you have your vexations, I have mine. Only this morning Conrad writes to tell me he is going back to India immediately."

I have heard people who have suffered sudden anguishes say that it is like a gunshot wound, which at first does not hurt at all. The struck man actually stands upright a minute, sometimes with a smile on his face, before he drops. So it was with me.

Had my grandfather seen me, I believe there would have been nothing to see; but he put his hand over his face, and spoke querulously rather than angrily.

"So make up your mind—if any woman ever could make up her mind. Stay, and I will send daily for news of your mother. Go, and though it is a fool's errand, my carriage shall take you there in safety. But, remember, you do not return. Adieu now. In an hour let me have your decision."

He rose, and bowed me out of his study with cold politeness—me, a poor girl whose mother was dying!

But I did not believe that; indeed, I must have accepted blindly the doctor's statement that it was a mild case, and the worst over, and I must have deluded my conscience in the most extraordinary way as to the sin of disobeying my grandfather as well as my mother. Still, looking back, I can pity myself. It was a hard strait for a poor girl to be in, even without that other thing, which nobody knew of.

But I knew it. I, the inner me, was perfectly well aware that my worst struggle was with another pang, and that the difficulty of choice sprang from quite another motive than the dread of vexing my grandfather, or even of saving myself—my own young life and my pretty face, which had, nevertheless, grown strangely dear to me of late.

If I went back to my mother, and Cousin Conrad went to India in a month, I should not see him again—perhaps never in this world. For even if he wished to come to bid me good-by, my grandfather would prevent it. I, too, perhaps. Of course I should treat him exactly as my mother had treated me, and shut the door of our infected house upon him, even though it broke my heart. Therefore, if I went away to-day, I should never look upon his face, never hear the sound of his voice—never any more!

Oh, my God! my God!

I believe I did instinctively cry out that

upon Him, conscious for the first time in my brief life that He has it in His power to take away the desire of our eyes at a stroke. My mother—Cousin Conrad—I might lose them both. Nay, by holding to one I should infallibly lose the other. What must I do?

I did that which we are all so prone to do—I temporized. I said to myself that for a girl like me to fly in the face of her grandfather and her mother was very wrong; that if I literally obeyed them, whatever followed, they could not blame me. At any rate, I would obey till Wednesday, when I should see Cousin Conrad, and could ask him, whose judgment of right and wrong was so clear and firm, what I ought to do.

Oh, sad sophistry! trying with vain arguments to reason myself into doing what I wanted to do, following the compulsion of an emotion so overwhelming, an agony so sharp and new, that I could not comprehend it or myself. Even with my mother in my heart all the time, wretched about her, longing to go and take care of her, I felt that at all risks, at all costs, I must stay and look on that other face, the only face that ever came between me and hers, just once more.

Within an hour I knocked at my grandfather's door, and told him I would stay, at any rate, for one day more—I dared not say two days, lest he might guess why. But no; he seemed almost to have forgotten what I came about till I reminded him.

"Certainly, certainly; we will send a messenger off at once to inquire, and I hope your mother will be quite well soon. She is sure to agree with me that you have acted wisely. And, for myself, I am much gratified by your remaining with me. When Conrad is gone, I shall have only you left to be a comfort to my old age."

He patted my hand almost with tenderness. Oh, what a hypocrite I felt!

Most of those two days I spent in his study. He seemed to like to have me, and I liked to be there. It was easier to busy myself in doing things for him than to sit with my hands before me, thinking, or listening to Mrs. Rix's terrible flow of talk. Poor woman, she was so torturingly kind to me—helped me pack up the basket of good things, giving strict injunctions that it should be dropped outside the door, and that the messenger should on no account go in. She hovered over me while I wrote the letter that was to accompany it, sympathizing with my torrents of tears, yet telling me no end of stories about families she knew who had been swept off wholesale by the small-pox, or made hideous for life.

"If it were any thing but small-pox, my dear, I should say, go at once. A mother is a mother, you know. When mine was in her last illness I sat up with her night after night for three weeks. The last forty-eight hours I never left her for an instant—not

till the breath was out of her body. I closed her eyes my own self, my dear, and thankful too, for she had suffered very much."

"Oh, be quiet! be quiet!" I almost screamed; and then the good woman kissed me, with her tears running down, and was silent—for about three minutes.

Her next attempt to change the subject was concerning "poor Major Picardy" and his sudden return to India, wondering why he went, when he could so easily have retired on half-pay or sold out; in the course of nature it could not be very long before he came in for the Picardy estate. "The property he must have; though, as I told you, your grandfather can leave the ready money to any body else—yon, perhaps, since he is much vexed at the Major's departure. Besides, India doubles the risk of his health, and if he dies, where is the estate to go to?—not that he is likely ever to be an old man. Still he might pull on with care, poor fellow! for a good many years. But I suppose he thinks it does not much matter whether his life is long or short, seeing he has neither wife nor child. He said as much to me the other day."

I did not believe that; it was contrary to his reticent character; but I believed a great deal. And I listened—listened as a St. Sebastian must have listened to the whiz of each arrow that struck him—until I felt something like the picture of that poor young saint in the National Gallery which my mother and I used to stop and look at. She was rather fond of pictures in the old days.

Ah, those days! Six months ago I would no more have thought of keeping away from her when she was ill, had she commanded it ever so, than of not pulling her out of a river for fear of wetting my hand! Sometimes, strangely as I was deceiving myself about the duty of obedience, and so on, there flashed across me a vivid sense of what a cowardly, selfish wretch I was, even though my motive was no foolish fear for my pretty face, or even my poor young life, the whole preciousness of which hung on other lives, which might or might not last.

Once, on the Tuesday evening, when I was taking a walk with Mrs. Rix, who had benignly given up a card-party, when the birds were singing their last sleepy song, the sky was so clear and the earth so sweet, I had such a vision of my mother lying sick in her bed, all alone, perhaps neglected—at any rate without me beside her, me, her own daughter, who knew all her little ways, and could nurse her as no one else could—that a great horror seized me. Had it not been night, I believe I should have started off that minute and gone to her, even had I walked the whole way.

With difficulty Mrs. Rix got me to go in and go to bed—Mrs. Rix, the poor dear

woman whose arguments I despised; yet I yielded, saying to myself, "It is only twelve hours to wait."

Wait for what? The message from my mother or the one more look at Cousin Conrad's face, the one last clasp of his hand, and then it would all be shut up in my heart forever—the love he did not care for, the grief he could not see. I should just bid him good-by, an ordinary good-by, and go back to my mother to begin again the old life—with a difference. But the difference only concerned myself. Nobody else should be troubled by it. If I were careful, even she should not find it out.

So, with a kind of stolid patience, and acceptance of whatever might happen, without struggling against it any more, I laid me down to sleep that Tuesday night, and woke up on Wednesday morning—a very bright sunshiny morning, I remember, it was—much as those wake up who, in an hour or two, are to be led outside their prison walls to feel the sunshine, to see the blue sky, just for a few minutes, and then, in their full young strength, with every capacity of enjoyment, "*aimer et d'être aimé*" (as wrote a young Frenchman, Roussel, who thus perished in the terrible later revolution that I have lived to see), be placed blindfold against a wall and—shot.

CHAPTER XII.

I SPENT most of the Wednesday morning in my grandfather's study, reading aloud his daily newspaper, writing some letters, and doing other little things for him which Cousin Conrad was used to do.

"But you may as well begin to learn to help me; there will be nobody else to do it when he is gone," said the old man, sadly.

One quality, which my mother used to say was the balance-weight that guided all others, she often thought me sorely deficient in—self-control. I think I began to learn it during those last days, and especially that Wednesday morning.

Several times my grandfather praised me quite affectionately for my "quietness." "One might suppose you were two or three and twenty, my dear, instead of not yet eighteen."

Not yet eighteen! What a long, dreary expanse of life seemed before me, if I took after him and the family (the Picardys, save during this last generation, have been a long-lived race), and attained to the mysterious threescore years and ten! Yet, in a sort of way, he was happy still.

But I—I shivered at the prospect, and wondered how I should ever bear it all.

Now I wonder no more. I think it will be so. Like him, I shall probably live to extreme old age; the last leaf on the tree:

"FOR ALL THAT, SHE OUGHT TO GO."

very lonely, but not forlorn. Yet I accept the fact, and do not complain. God never leaves any life without sunshine while it can find its sunshine in His smile.

Cousin Conrad had not said what time he should arrive, and I thought every ring at the hall bell was his. When at last he came, it was without any warning. He just walked in as if he had left us yesterday, and all things were the same as yesterday.

"General! Cousin Elma! How very cozy you look, sitting together!" And he held out a hand to us both.

Then he sat down, and he and my grandfather fell into talk at once about his going to India.

I would have slipped away, but nobody told me to go away, or seemed to make any more account of me than if I were a chair or table. So I took up a book and staid. It

would have been dreadful to have to go. Even a few additional minutes in his presence was something. Of my own affairs nobody said a word, and for the moment all remembrance of them passed from me. I only sat in my corner and gazed and gazed.

He looked ill, and perhaps a shade graver than usual; but the sweet expression of the mouth was unchanged, and so was the wonderful look in the eyes, calm, far-away, heavenly—such as I have never seen in any human eyes but his.

At that moment, ay, and many a time, I thought if I could just have died for him without his knowing it—died and left him happy for the rest of his life; yes, even though it had been with some other woman—how content I should have been!

My grandfather and he began talking earnestly. To all the General's arguments he answered very little.

"No, I have no particular reason for going—at least, none of any consequence to any body but myself. As you say, perhaps I am weary of idleness, and there lies work which I can do, and come back again in a few years."

"To find me in my grave."

"Not you; you will be a hale octogenarian, and that young lady," turning to look for me, "will be a blooming young matron. By-the-bye, Cousin Elma, did you give my message to your mother? I hope she is quite well."

I could bear no more. I burst into violent sobs. He came over to me at once.

"What is the matter? What has happened?" Then in a whisper, "Surely my little jest did not offend you?"

Evidently he knew nothing; but my grandfather soon told him all.

"What! her mother ill, and Elma still here?"

This was all he said. Not in any reproach or blame, but in a kind of sad surprise. At once, as by a flash of lightning, I saw the right and the wrong of things; how I had acted, and what he must have thought of me for so acting.

"She is here because I would not allow her to go," said my grandfather, hastily and half apologetically, as if he too had read Cousin Conrad's look. "Mrs. Picardy herself, with extreme good sense, forbade her coming. Think what a risk the girl would run. As a man of the world, Conrad, you must be aware that with her beauty—"

"Yes, I am aware of every thing; but still I say she should have gone."

It was spoken very gently, so gently that even my grandfather could not take offense. For me, all I did was frantically to implore Cousin Conrad to help me, to persuade my grandfather to let me go. I would run any risks. I did not care what happened to myself at all.

"I know that, poor child. Hush! and I will try to arrange it for you."

He put me into an arm-chair, very tenderly, and stood by me, holding my hand, as a sort of protection, if such were needed. But it was not. Either my grandfather had seen his mistake, or did not care very much about the matter either way, so that he was not "bothered;" or else—let me give the highest and best motive to him, as we always should to every body—before many more words had been said he felt by instinct that Cousin Conrad was right.

"Elma has shown her good feeling and obedience to me by not going at first," said he, with dignity. "Now if you think it advisable, and if, as I suppose, the risk is nearly over—"

"No, it is not over. Do not let us deceive ourselves." Was it fancy, or did I feel the kind hand closed tighter over mine? "For all that, she ought to go."

At that moment Mrs. Rix came in, looking very much troubled. She had met the messenger returning with the news that "Mrs. Picardy was not quite so well to-day."

"Order the carriage at once," said my grandfather, abruptly.

Then there was a confused hurrying of me out of the room, packing up of my things, talking, talking—poor kind Mrs. Rix could do nothing without talking!—but in spite of all the haste, at the end of an hour I was still standing in my bedroom, watching stonily every body doing every thing for me. Oh, they were so kind, so terribly kind, as people constantly are to those unto whom they think something is going to happen; and they gave me endless advice about nursing my mother and saving myself—I who knew nothing at all about small-pox or any kind of illness, who had never in my life been laid on a sick-bed or stood beside one! They were sorry for me, I think; for I remember even the little kitchen-maid coming up and pressing a little bag of camphor into my hand.

"Take care of yourself, miss; oh, do take care of your pretty face," said she; but I paid no attention to her or any body.

The one person who did not come near me was Cousin Conrad. I thought I should have had to go without bidding him good-by, when I saw him standing at the drawing-room door.

"Here, Mrs. Rix, I want to consult you."

And then he explained that he had fetched a doctor, whose new theory it was that second vaccination was a complete preservative against small-pox—that every thing was ready to do it if I would consent.

"You will not refuse? You think only of your mother. But I—we—must think also of you."

"Thank you," I said; "you are very kind." He could not help being kind to any creature in trouble.

"HE DREW MY ARM THROUGH HIS."

Without more ado I bared my arm. I remember I wore what in those days was called a tippet and sleeves, so it was easy to get at it; but when the doctor took out his case of instruments I began to tremble a little.

"Will it hurt much?—Not that I mind." In truth I should not have minded being killed, with his hand to hold by, and his pitying eyes looking on.

"Do not be frightened. It hurts no more than the prick of a pin," said Cousin Conrad, cheerfully, "only it leaves a rather ugly mark. Stop a minute, doctor. Mrs. Rix, push the sleeve a little further up. Do not let us spoil her pretty arm."

The doctor called for somebody to hold it.

"I will," he said, seeing Mrs. Rix looked frightened. She said she could not bear the sight of the smallest "surgical operation." "Not that this is one. But if it were," add-

ed he, with a look I have never forgotten, never, through all these years, "I think I should prefer nobody to hurt you but me."

There was a silent minute, and then the doctor paused.

"I forgot to ask if this young lady is likely to be in the way of small-pox just at present, because, if so, vaccination might double the risk instead of lessening it. She ought to keep from every chance of infection for ten or twelve days."

I said, with strange quietness, "It is of no consequence: I must go. My mother may be dead in ten or twelve days."

Cousin Conrad stopped the surgeon's hand. "If it be so, what are we doing? In truth I hardly know what I am doing. Let me think a moment."

I saw him put his hand to his head. Then he and the doctor retired together, and talked

apart. I sat still a minute or two, and followed them.

"I can not wait—I must go."

"You shall go, poor child," said Cousin Conrad. He was very white—long afterward I remembered this too—but he spoke quietly, soothingly, as to a child. "Listen; this is the difficult question. If you are vaccinated, and go at once to your mother, you have no chance of escaping the disease; if you are not vaccinated afresh, there is just a chance that the old protection may remain. He does not say you will escape, but you may. Will you try it? If you must go, you ought to go at once. Shall you go?"

"Of course I shall."

He drew a deep breath. "I thought she would. Doctor, you see?"

"She runs a great risk," said the old man, looking at me compassionately.

"I know that—nobody better than I. Still, she must go. Come, Elma, and bid your grandfather good-by."

He drew my arm through his, and we went down stairs together, Mrs. Rix following us. She was crying a little—kind, soft-hearted woman!—but I could not cry at all.

My grandfather, too, was very kind. "A sad departure, Elma. We shall all miss you very much—shall we not, Conrad? Such a bit of young bright life among us old folks!"

"Yes," said he.

"Good-by, my dear, and God bless you. Kiss me."

I did so, clinging to him as I had never clung to any body except my mother. My heart was breaking. All my cry now was to go to my mother. Indeed, the strain was becoming so dreadful, minute by minute, that I was longing to be away.

"Is any body going in the carriage with you?" said my grandfather.

Eagerly I answered that I wanted nobody, I had rather be alone; that I wished no one to come near our house, or to run the slightest danger of infection. And then they praised me, my grandfather and Mrs. Rix, for my good sense and right feeling. One person only said nothing at all!

Not till the very last moment, when I was in the carriage and he standing by it—standing bare-headed in the sunshine, looking so old, so worn. And oh, what a bright day it was! How happy all the world seemed, except me!

"If I do not come with you, it is not from fear of infection. You never thought it was?"

"No."

"That is right. And now think solely of nursing your mother and taking care of yourself. Take all the care you can. You promise?"

"Yes."

"Then good-by, and God bless you, my dearest child."

He said that—those very words. Confused as I was, I was sure of this.

A minute more, and I was gone. Gone away from him, from the sound of his voice and the sight of his face; gone away into darkness, anxiety, and pain: how sharp a pain I did not even then sufficiently recognize.

For there was remorse mixed with it—remorse that, in my passionate exaggeration of girlhood, felt to me like "the worm that dieth not, the fire that is never quenched." From the moment that the glamour passed away, and I got into the old familiar scenes—even before I entered the village—the gnawing pain began. There was no need of Mrs. Golding's bitter welcome, "So, Miss Picardy, you're come at last, and high time too!"—no need of her sarcastic answer that my mother was "going on quite well, and perfectly well attended to," to smite me to the very heart.

"Beg your pardon, miss, but as nobody expected you, the parlor isn't ready; and of course you won't think of going up stairs."

I never answered a word, but just began to feel my way up the narrow staircase. After Royal Crescent, how narrow and dark it seemed, and how close and stuffy the whole house was! Yet here my mother had been lying, alone, sick unto death, without me; while I—oh me, oh me! would God ever forgive me! She would, I knew; but He? Or should I ever forgive myself?

I think the sharpest conscience-sting of all is that which nobody knows of except one's self. Now no creature said to me a word of blame. Even Mrs. Golding, after her first sharp welcome, left me alone, too busy to take the slightest notice of me or my misdeeds. She and all the house seemed absorbed in their nursing. There could be no doubt how well my mother was loved, how tenderly she had been cared for.

But I—I was made no more account of than a stock or a stone.

"You can't go in," said Mrs. Golding, catching hold of me just as I reached the familiar door. "Nobody sees her but the nurse and me. And she doesn't want you. She begged and prayed that we wouldn't tell you; and when you was obliged to be told, that we'd keep you away from her. Bless her, poor dear lady, she might have saved herself that trouble."

I groaned in the anguish of my heart.

"Hold your tongue, or she'll hear you. She can't see, but her ears are sharp enough. For all she said about your not being allowed to come, she's been listening, listening every day."

"I must go in—I will go in."

"No, you won't, Miss Picardy."

And without more argument, the old woman pushed me into the little room beside my

mother's, shut the door, and set her back against it.

"Here you are, and here you may stop; for you're not of the least good any where else in the house. I'm sorry the room's so small—after them at Royal Crescent—and dull for a young lady as has been going to dancing-parties and card-parties every night; but it's all we can do for you just at present. By-and-by, when your mother gets better, if she does get better, and God only knows—"

But here even the hard old woman grew softer at the sight of my despair.

Does any body know what it is—the despair of having forsaken a mother, and such a mother as mine?

In all her life she had never forgotten me, never ceased to make me her first object, first delight; and now, in her time of need, I had forgotten her, had put her in the second place, had allowed other interests and other enjoyments to fill my heart. And when it came to the point, I had taken advantage of her generous love, seized upon every feeble excuse to stay away from her, left to strangers the duty of nursing her; ay, and they had done it, while her own daughter had contented herself with mere superficial inquiries, and never come near her bedside.

This, let people pity and excuse me as they might—and Mrs. Golding, to soothe me, did make some kindly excuses at last—was the plain truth of the matter. However others might be deceived, I could not deceive myself. If, as they hinted, my mother were to die, I should never be happy again—never in this world.

And there I was, bound hand and foot as it were; close to her, yet unable to go near her, or do any thing for her; shut up in that tiny room, afraid to stir or speak lest she should find out I was there, which, in her critical state, both the nurse and the doctor agreed might be most dangerous. I spoke to them both, and they spoke to me those few meaningless encouraging words that people say in such circumstances; and then they left me, every body left me, to pass hour after hour in listening for every sound within that solemn, quiet sick-chamber.

All the day, and half of the night, I sat there, perfectly passive, resisting nothing except Mrs. Golding's efforts to get me to bed. "What was the use of my sitting up? I was no good to nobody."

Ah! that was the misery of it. I was "no good to nobody!" And with my deep despair there mingled a mad jealousy of all those who were any good, who were doing every thing they could think of for my darling mother, while I sat there like a stone.

Oh, it served me right—quite right. Every thing was a just punishment, for—what?

I did not even ask myself what. I gave no name to the thing—the joy or the pain—which had been at the bottom of all. From

the moment I had crossed this threshold my whole life at Bath seemed to pass away—like a dream when one awakes—as completely as if it had never been.

MACARIUS'S LESSON.

THE sunshine lay along the sands
In lingering, level, shining bands;
Into an open cell it shone,
Where monk Macarius sat alone,
And started as a shadow fell
Across the glitter in his cell.
"Father," a burdened sinner said,
"How shall my peace with God be made?
How shall I live the life of saints,
For which my hungry spirit faints?"
"Fly from the sight of man, my son,
So be thy Christian race begun;
In solitude thy sin lament,
By night and day thy deeds repent;
Sin not in speech, thy tongue control—
So shalt thou save thy sinful soul."
That night Macarius on his bed
Heard a sweet voice that softly said,
"Thou thinkest goodness dwells with thee?
Rise! go to yonder town and see!
Beside the shore two women dwell
Far above thee as heaven from hell."
At early dawn, with prayer and groan,
Macarius left his cell alone,
And sought the city's busy roar,
The craftsmen's street beside the shore,
Where Claudia and Eudora sat
Braiding together on a mat.
With accent stern the abbot said,
"What life, O women, have ye led
That any angel should come down
To give to you a saintly crown?"
With startled eyes, and lips apart,
And mingled words, as one in heart:
"We are our husbands' wives, and try
To serve them with humility.
No saints, O father, can we be,
But two poor women, as you see."
"Nay," muttered he; "some mightier grace
Has sanctified your dwelling-place.
What have ye offered to the Lord?
What duty done? what sin abhorred?
How in the crowded, wrangling street
Made of your lives an odor sweet?"
"We have done nothing. Once we said
For God's sake we would be unwed,
And live as nuns in convent cell.
Our husbands did not think it well,
So then we only made a vow
To live in Christian peace as now,
Nor let a word of strife or wrong
Be heard again from either tongue."
The father bowed his head and sighed.
"Obedient! silent! self-denied!—
And women too! Ah, Lord, I see
How far this life surpasseth me!"
A wiser and a better man
His course from thence Macarius ran.
O saint and abbot, sleep in peace!
I pray not that thy tribe increase,
For if that angel came again
To cleanse a soul from sinful stain,
In what new land, beside what sea,
Could two such wondrous women be?

Editor's Easy Chair.

THE tender, beautiful, and touching words in which Mr. Anthony, of Rhode Island, announced to the Senate the death of Mr. Sumner, and the affectionate pathos with which, as the organ of the Senate, he committed the body to the care of Massachusetts, well expressed the feeling with which the news of his death was every where received. Even those to whom Mr. Sumner was so long the representative figure of the spirit which they most bitterly opposed must have heard of his death with softened feeling, so free had he always been from all vindictiveness, and so generous had been his later words and works. Indeed, although a combatant all his life, his war was with a cause, and not with persons. He was so earnest and self-involved in maintaining his own view, he had so sincere a loyalty to conscience, and so imperious a sense of duty, that he seemed the simplest, most child-like, and unsophisticated of men. This made it difficult for him to understand a personal feeling in others which he did not himself cherish. He did not spare the most public and emphatic censure of conduct which he believed to be wrong in his associates as well as in his opponents, and he could not readily understand why those whom he censured should be angry with him for doing his duty.

Thus in the beginning of his political career he published a letter to one of his friends, a leader in the party with which he had acted, Mr. Robert C. Winthrop, whose Congressional conduct in regard to the Mexican war seemed to Mr. Sumner wrong. He did not hesitate to say so most plainly and most publicly. Yet the heroism and the simplicity of the act are equally notable. "Let me ask you to remember in your public course the rules of right which you obey in private life. The principles of morals are the same for nations as for individuals. Pardon me if I suggest that you have not acted invariably according to this truth. You would not in your private capacity set your name to a falsehood, but you have done so as Representative in Congress." Those who know what the Whig Boston of 1846 was, the Boston of Webster, Everett, and Winthrop, and who also knew Mr. Sumner, will understand that nothing more clearly illustrated the heroic quality of his character than such a letter in such a place and at such a time. Yet it probably did not occur to Mr. Sumner that the letter could disturb his social relations. Had he thought of such a result, his action would of course have been the same; but his sense of duty was so supreme that there was never any question in his mind of obedience to it, nor any suspicion that the obedience could end in personal alienation.

One evening in the summer after the passage of the Fugitive Slave Bill, at the reception of a Southern lady in Newport, well known for her hospitality in those days, one of Mr. Sumner's friends was talking with the daughter of the hostess, when he saw her face suddenly flush, and heard some hasty exclamation of anger from her lips, and turning, he saw Mr. Sumner entering the room. He had just arrived, and was brought by a friend to the party. But it was not possible for him to suppose that his fidelity to his moral

convictions, and his official conduct under oath, could make him unwelcome at such a time. Later in his career he was charged with acrid and morbid personal hostility in his political differences. But he always warmly denied it, and said that while a public man in his position must often criticise the public action of others, and describe it in such terms as to arrest public attention, and, if possible, prevent its evil consequences, yet that it was most unjust to describe such criticism as personal denunciation in the sense in which those words are generally understood. "If a public officer seems to me grossly ignorant," he would insist, "of course I must say so. If he seems to me unfit for his place, I can not honorably hold my peace. But it is foolish to call my opposition personal hostility." Yet his adhesion to his own view, and his uncompromising criticism of the differing view even of his personal friends, sometimes clouded their intercourse, and in one or two instances of persons eminent in public life led to a final rupture. Yet even this seemed to be unattended upon his part with any personal asperity. If he thought a man false he said so, but he did not gnaw his reputation with sneaking innuendoes, nor spatter it with petty scandals.

For the unhappy man whose assault at last, after many years, slew him, Mr. Sumner's feeling was of the same impersonal kind. A friend once asked him how he felt toward Brooks, and he replied, quietly, "I have no ill feeling, and never had. So far as I am personally concerned, I think of the event as if a stone had fallen upon my head from a roof in the street." One summer evening the same friend was strolling with him through the Congressional Cemetery; and while Mr. Sumner was looking at some monument, his friend came upon the cenotaph of Preston Brooks. As he paused before it Mr. Sumner joined him, and reading the name, said, gravely, "It is strange that I never saw this before." He remained for some moments silent, and then moved slowly away, saying only, and with deep feeling, "Poor fellow! poor fellow!" As the contest in which he was engaged deepened he was often urged to carry arms, and a Senator says that at one time it was the habit of some of his colleagues who did not hesitate to be armed to drop in at his rooms at the hour that he usually left them to go to the Capitol, and, unconsciously to him, accompany him as an armed escort. One of them at length said to him that, for his own part, he did not mean longer to undertake the defense of a man who did not care enough about his own life to protect it. Mr. Sumner said that he would think of it. "And so I did," he said, laughing, as he told the story afterward to a friend; "I thought of it, and I bought a pistol. But I had never been used to pistols, and shooting was not in my line. If I had carried one, and had been attacked in the street, while I should have been fumbling to get it out of my pocket my adversary would have fired; and if I had fallen, it would have been said that I was killed in a street brawl in the act of drawing a pistol. I decided that I had better do my duty and take my chance."

His imperious sense of duty, his overpowering

will, and his uncompromising speech gave him often an appearance of haughtiness, and even of arrogance, which was singularly unjust to the fact. He was, indeed, so sure of his own side that he did not recognize any other. But this is almost essential to successful leadership. As Emerson says that nature is so set upon certain results that she overloads and exaggerates the disposition which produces them, so moral leadership requires a faith so absolute as to deny the possibility of any other. In the midst of a very warm discussion upon a point of public policy a friend said to Mr. Sumner, "The difficulty is that you don't seem to see that we who take the other view are quite as honest as you." "There is no other view," thundered he in reply. Louis Blanc observed this distinction between Mr. Gladstone and Mr. Bright. The latter saw only the reason of his own side. The former saw that of his adversary so clearly that it relaxed his own resolution. A man can not strike a very hard blow who believes that his opponent is half right. It is the conviction that he is wholly wrong that loads his antagonist's weapon for a fatal blow.

In depicting his later political career we are very sure that his biographer will find not that Mr. Sumner willfully and for personal glory swerved from his party line, but that in his sincere judgment his party swerved from the line of right. He had no abstract love of opposition; and when it is said that he was better fitted for the attacking minority than for the majority in possession, the highest compliment is paid to his moral rectitude. For a party from the moment that it reaches power begins to compromise to retain it; and when moral considerations are involved, as they always were during Mr. Sumner's political career, the duty of the honest partisan is to hew to the line. In the summer of 1865 no man of his party had more hope of the President or more expectation of supporting him than he. But on Washington's birthday, in February, 1866, the President publicly denounced him. It was because Mr. Sumner would not give an inch, and censured the President for giving. He was accused then and at other times of an inordinate desire of personal aggrandizement, and of practically vesting the whole government in his own person. And this has been alleged as the reason of his constant opposition to the executive of his own party. But his relations with Mr. Lincoln and Mr. Seward were always those of friendly co-operation. He was one of the first at Mr. Lincoln's death-bed, and his eulogy of him in Boston was nobly characteristic. He was so often in a minority in his party not because he would have his own way or none, but because he would have only what he held to be the right way. He was impracticable only as all men of unbending moral integrity are; and it would not be easy to find among the public men of his time one who had a truer perception of the real significance and tendency of public affairs.

In September, 1846, when he was thirty-five years old, and thought to be a visionary and extreme young man, highly educated, indeed, and perhaps fitted for some literary professorship, but wholly without political experience or sagacity, and the very last man by character, talents, and training to be a political leader of Mas-

sachusetts in the grave public situation, he went one September evening to Faneuil Hall with all the famous Whig chiefs, and spoke upon the duties of his party at that time. The tone and character of the speech may be supposed from its conclusion, which was that the Whig party should demand the abolition of slavery. As he was ending Mr. Sumner referred to Mr. Webster, then Senator, whom the meeting had hoped to welcome. He appealed to him to lead the party in that great demand. The time had arrived. The duty was not to be avoided. It was the question of the hour. "By your plea for the Union," said Mr. Sumner, "you have justly won the name of Defender of the Constitution. By the masterly Oregon negotiation you have earned another title, Defender of Peace. And now," exclaimed the orator, with generous fervor—"now add a higher title, never to be forgotten on earth or in heaven—Defender of Humanity." It is easy to imagine the incredulous contempt with which the old Whig chiefs heard this appeal from the ardent tyro. "He advise Webster! He, this morbid theorist, instruct the most consummate of American statesmen! It is both comical and disgraceful." Mr. Sumner sent a copy of his speech to Mr. Webster, and Mr. Webster acknowledged it in a cool and polite note. He said that he respected the character and talents of the orator, and wished him well. Then, in his most Olympian strain, Mr. Webster added: "In political affairs we happen to entertain at the present moment a difference of opinion respecting the relative importance of some of the political questions of the time, and take a different view of the line of duty most fit to be pursued in endeavors to obtain all the good which can be obtained in connection with certain important subjects." Which saw most clearly, the consummate statesman or the impracticable visionary?

The lower arts of statesmanship are often held to be its chief substance, and the practical sagacity of Sir Robert Walpole, whose moral nature was certainly very meagre, is often cited as the proof that morals are impertinent in politics—a doctrine which Mr. Robert Lowe has strenuously maintained. Yet if Sir Robert gave England peace when peace was indispensable, his system and its spirit brought English liberty into greater peril under George the Third than had threatened it since the revolution. Immense and various knowledge, both of men and affairs, a practical mind and constant self-command, are indispensable to the statesman. He must have wisdom, and the gift of applying wisdom to daily details of business. But it is as with the apostle's graces. There be many virtues, and all most needful. Faith, hope, charity; but the greatest of these is charity. So with all the gifts of the statesman there must be practical faith in the good policy of good morals, a profound conviction that nations, like men, are morally responsible, or political economy will not save him or his country. "To be useful," says Sir James Mackintosh of Lord Somers, "he submitted to compromise with the evil that he could not extirpate." But the very genius of statesmanship is the power of knowing what public evil is so cancerous that it must be extirpated at every cost. What Mackintosh further says is exquisitely true of Sumner: "His life proved that virtue is not a vision."

Indeed, however any honorable man any where in the country may have differed with him, he must still admire the fidelity with which he served his own idea of duty. Through his whole career he was loyal to the moral ideal that shone unclouded in his mind. In a day of doubt and fear, of abject cowardice and sophistry and retreat, he stood erect and unshrinking, and fought his resounding battle. His State has had many illustrious sons. But none more truly than he represented the quality of Massachusetts manhood.

We hope that the ladies and gentlemen of the New York Vocal Society do not suppose that their good work is unappreciated because there are not many sonorous paragraphs in the newspapers about their delightful concerts. There was never a time of such musical interest and activity of the better sort in the city, and there are no concerts which are more thoroughly and intelligently enjoyed than those which we were becoming used to calling the madrigal concerts, until the Mendelssohn *Antigone* choruses and the Gade *Cantata* taught us that the limitation was inadmissible. Yet the word still serves to point a good distinction, and if the temple of musical art which is near Steinway Hall, in which nothing is ever didactically taught, may be called an Academy of Music, let us still speak of the happy vocal evenings at Steinway as the madrigal nights. Hark!

"My bonny lass she smileth
When she my heart begulleth,
Fa la la.
Smile less, dear love, therefore,
And you will love me more,
Fa la la.

"When she her sweet eye turneth,
Oh, how my heart it burneth!
Fa la la.
Dear love, call in their light,
Or else you burn me quite,
Fa la la."

That is the key. And it was to such measures that our English ancestors listened in the days when Nell Gwynne was painted as a modest shepherdess and the Duchess of Portsmouth as the elusive Daphne.

Here is an association of ladies and gentlemen, nearly a hundred in number, who are all admirably accomplished in music, and who gather from their various pursuits to cultivate this exquisite pastime, giving two or three concerts every year. They do this in the great roaring Babylon of the metropolis as if they were all denizens of Miss Mitford's "Village" or of Mrs. Gaskell's "Cranford," going at six o'clock to take tea with the hostess of the evening, and gossiping amiably—for in musical circles, as is well known, scandal is never heard, but only warm praises of all the popular artists of the moment—gossiping amiably, we say, until the gentlemen drop in, about seven, and then to business—good, hearty singing and drilling, until—gracious! ten of the clock resounds, and here is Miss Beebe's maid with her overshoes and lantern, and Mr. Aiken and Mr. Bush stand ready to "see home" any soprano or contralto "unprovided with an escort." There is this delightful air of domesticity and homely sincerity in the madrigal concerts, arising from the character of the music, the total want of display, and the honest English language

in which every thing is sung. Such is the genuine character of the concerts that no morning critic could possibly describe one of the songs sung as a "number" admirably "recited" or "interpreted."

But the Easy Chair would be guilty of great injustice if it gave the impression that there is something of the country-parlor character in the madrigal concerts. Far from it. We doubt if there is a more accomplished company of singers in the country. They give certain choruses of Mendelssohn in a manner that would have charmed that master, while English glees and quartettes gush and ripple and trill from the throats of certain singers in the company in a way which shows that they come also from their hearts. At one of the late concerts the ever fresh and lovely "Where the bee sucks, there suck I," was sung so exquisitely as to give even the neighboring Wagnerians pause. And this performance is illustrative of the good work of the society. For while we are all hurried forward upon the Wagner freshet, and our own language has been long obsolete in fashionable music, and the thunder of the great battle between Ormuzd and Ahriman—the German and Italian schools—fills the air, it is most useful to look back and see the real worth of our old characteristic English school—or style, if the larger name be denied—and to show, as the Vocal Society does, its equal claim to admiration with the very best of the most modern German classics.

If you find a delicious quaintness in the old English songs and ballads—the poetry, that is to say—if you perceive in them a certain ineffable grace and sweetness, and string them as diamonds upon your rosary of memory, diamonds of a lustre that other gems may emulate but not extinguish, why not the music also?

"Take, O take those lips away,
That so sweetly were forsworn;
And those eyes, the break of day,
Lights that do mislead the morn."

It is a perfect strain. Shakespeare has it, and Beaumont and Fletcher, and who has ever had any thing better? What depth and tenderness and breezy freshness of dawn! What imagination and what melody! There may be the same kind of charm in the old music, and the Vocal Society gives us a chance to hear it. It says to us, with our ears full of Mr. Swinburne's hot lyrics, as it were, "Listen to this! What do you think of that?" To hear one of these concerts, with the madrigals and the glees and the magnificent choruses and the songs in several parts, all wisely selected and nobly sung, is, in another art, like reading the one song of Waller, and the many of Herrick, and those that are scattered through all the older English literature. We hope that the society will never give a concert without two or three madrigals at least. They are not to be heard elsewhere, and they are always heard with delight. They may well be repeated. Once a year is not too often to hear a good song, whether read or sung.

It is something, too, if listening to such music should recall the virtues which poetry and the imagination conspire to associate with the old English home, and of which—let us whisper it carefully!—neither Rossini nor Wagner reminds us. It is not that virtue was more virtuous in other days, but its setting is quaint and pleasing.

No young person of the better sex in Cranford, whose maid came for her with the lantern at ten o'clock, sang more charmingly than Miss Beebe; but when Miss Beebe sings "Where the bee sucks," she refreshes the delightful life of Cranford, and gives her hearer a double delight.

Should the kind eyes of that lady ever chance to fall upon these words, the Easy Chair humbly deprecates her censure. For it has been severely taught. Some months ago it ventured upon some harmless pleasantries about the music of Bach, and the severe style of certain concerts, which shall not be more plainly named, lest fearful passions should be aroused, and the critical bosom begin to heave and swell with volcanic emotions like those of Bald Mountain, North Carolina. The events of life, it has often thought, may be regarded as a series of sermons; and the great moral of the caustic criticism which followed the efforts of the Easy Chair to jest about so serious a subject as the fugues of Bach—to the constant hearing of which hereafter, however, the wicked Heine remitted certain of his countrymen, as to a torment beyond Dante—is that the elephant should not try to dance the minuet. The well-meaning animal, however, is perpetually making that mistaken effort. The Easy Chair lately saw one of the finest of his kind airily tossing his trunk and trying to skip lightly by hinting to a Wagnerian devotee a jest about the *Lohengrin* and the music of the future. "Why," said this unconsciously clumsy bungler—"why not leave the future to take care of its own music? Sufficient for the present are Beethoven and Mozart."

Misguided creature! The Wagnerite said to him: "You don't like the music of Wagner because you don't understand it. Beethoven and Mozart did well with the limited resources of the orchestra in their day. But their minds did not grasp the totality and harmony of their own art." And thereupon followed what to the ordinary elephant seemed a vague metaphysic of music. But he knew very well that the Wagnerite held him for a very inferior animal, and he winced when that devotee of the future said to him, "Don't you know that within the memory of men living the *C Minor Symphony* of Beethoven, and his *Eroica*, and the prodigious *Seventh*, were the music of the future? Don't you know that the people who played the *Battle of Prague* upon the piano, and thought it fine, hooted Beethoven as a barbarian, a maniac, and an idiot? And can you, who know these great truths, join the popular cry against the new and glorious master whose only offense is that he will not tickle the popular ear with the tum-titi of the idiotic Bellini, or the meretricious jingle of the Rossinian melody? Tell me, is music mere molasses and water?"

The discomfited jester crept away. The fervor of the Wagnerite made him ashamed even of humming a tune. The airy beat of a melody in his mind seemed to him puerile and unpardonable trifling, if not positively immoral. The hand-organs grinding *Les Roses* at every street corner became to his troubled fancy pestilent myrmidons of the great father of lies. Why are they permitted to debauch the public musical sense? thought he. Does not the Board of Aldermen know that in the future there will be no hand-organs? Will not his worship the Mayor

have the moral courage to veto the musical license of every beer-garden in which the band shows no just conception of the totality of art? If to jest about the fugues of Bach were an offense, what shall be said of speaking lightly of Wagner? The allopath and the homeopath, the Trinitarian and the Unitarian, the Darwinian and the doubter, may chaff each other without warmth or a sting, but two thunder-clouds in sultry August are not fuller of opposing lightning than the Wagnerite and the anti-Wagnerite of satire, wrath, and recrimination. What is the meaning of this discord in music? Why must the lover of the *Fifth Symphony* hold *Martha* in such inexpressible contempt, and the friend of the Italian opera regard the fugue with the emotion of the under-graduate toward the professor of didactic theology?

These are ancient and unanswerable questions.

Forty years ago to like Beethoven was an outlandish, bizarre, affected taste. To-day it is the test of musical orthodoxy. We—that is to say, the respected reader and the Easy Chair—like him, of course. We understand what good music is. The grief of our lives is that we can not hear *Fidelio* once a week during the season. We know that Beethoven is as sole and unapproachable as Shakespeare. You may pluck the north star from the sky, but not that faith from our souls. And thanks to Mr. Theodore Thomas and the Philharmonic Society in New York and in Brooklyn, we can hear the symphonies almost weekly. But how do the respected reader and the Easy Chair stand upon the great Wagner question? Alas! here is another of the sermons that life is perpetually preaching: we can never be at rest. No sooner have we adjusted ourselves to Beethoven and the fugues of Bach, and achieved a comfortable pity for those who do not like them, and are, as it were, taking our ease in our inn, than some new fellow under the window begins to pipe, with a King of Bavaria and a court at his back, and fills the air with music and theories of music, and we have to decide whether we like them. Nothing, of course, seems easier; but seeming is deceptive. For, as every body knows, we have to decide not only whether we like them, but whether we ought not to like them. If the new thing turns out to be approved by the best doctors, and the new man to belong with the best men, we wish to be of those who recognize that fact at once. The respected reader and the Easy Chair know very well that if they had been among the first auditors of the Beethoven music, they would have had no doubt as to its superiority and the true position of the composer, just as they would have seen that Columbus was right had they but heard him unfold his views of a western route to Cathay.

This question of liking Wagner is one which "the town" has been trying to answer during the early spring. The new master is fortunate in his chief disciple in America—an apostle, we might almost call him—Theodore Thomas, whose orchestra is renowned for its admirable skill, and who is himself the most noted and popular "leader" in the country. His enthusiasm for Wagner is such that the master has been introduced to this country in the happiest possible manner. In no other great city in the world, except, perhaps, Munich, has the Wagner orchestral music

been more constantly performed, nor by a more competent and highly trained orchestra. Once a week during the summer, at the pleasant Central Park Garden concerts, Mr. Thomas has set apart a Wagner night, a concert at which only the Wagner music is played. And those nights, the Wagner lovers declare, are the most popular, the most thronged, and the most enthusiastic of all. But mere orchestration is little in the Wagnerian theory. It is the union of poem, scene, singing, and instrument which gives the perfect music. And the Wagner operas have been hitherto little known to us, except at the Stadt Theatre, a small house in the Bowery, frequented chiefly by Germans. But that nothing might be wanting to his complete and satisfactory presentation in America, Mr. Strakosch this year produced the *Lohengrin* at the Academy with his fine company, Nilsson and Campanini at the head, and with every splendor and completeness of accessory. It illustrates the good fortune of Wagner. What the musical composer most needs for his work is opportunity and resources. And these have been lavished upon the lucky Wagner. A favorite of the King of Bavaria, if, as a musician says, he wanted lions and ostriches for his operas, lions and ostriches he had. He had but to cry for the moon, and it was placed in his hands. This was at home. Abroad he needed an enthusiast, a fit leader, a drilled orchestra, and a constant chance for popular hearing. All this he has had in New York.

The crowd was very great. The excellence of the artists was conceded. The spectacle was long, and the throng remained to the end. But there was, it must be said, little enthusiasm, although many musicians and musical connoisseurs were delighted. But the true Wagnerites bide their time. "No," they say, "greatness is never acknowledged at first. The old is so firmly entrenched that the new seems impertinent and foolish. But remember Columbus! Remember Luther! Remember Sir Samuel Romilly! Remember James Otis! Remember Beethoven! Remember all the pioneers as we do, and then you will understand why we are not daunted by your doubts, and are sure that the future will justify the faith that we repose in it."

THE *Evening Post* quotes a Florentine journal, which, after warmly praising a picture by Mr. Henry Peters Gray, of New York, now in Italy, says that it is destined to go over the sea to the gallery of "Maresciallo Roberts," "in a country where artists of genius find larger recompense than in ours." That is to say, the excellent critic, writing in the shadow of the Pitti and the Uffizi, in the glowing presence of the "Seggiola" and of the Medicean Venus, declares that America is a better country for clever artists than Italy. The Maresciallo Roberts, in his judgment, and the Ill'mi Signori Giovanni Taylore Johnston, Gulielmo Tyldeno Blodgett, ed altri, foster the fine arts more liberally than Italy itself! What have the native gentlemen of the brush who bemoan the want of "an atmosphere of art" in America to say to this? Does the courteous Italian mean merely that there are more rich men in America than in his own country? No, for there is a tone of reproach in his remark. He evidently means to rebuke the want of sympathy with Italian artists of genius,

and to say that they must look elsewhere for encouragement. He seems to suppose that the happy land beyond the Western main is the paradise of art, and that piles of gold here await the heaven-inspired artist.

Did Mr. Gray think so, probably, before he sailed away? Did he know that he dwelt in the land of large recompense to artists? Or, as he stood before his easel in his quiet studio—it was in the upper part of Broadway—and laid the colors upon his canvas, did he sometimes wonder why he had devoted himself to art, and had not tried the dry-goods or grocery line? We may be sure that there were times when he turned over the studies and sketches of his earlier years in Italy, and as he touched them the thoughts and hopes and dreams of those years arose in his mind, and he longed once more to see the chosen home of art, the land hallowed by the history of painting, and rich with the most famous treasures of Raffaele and the rest—that happy country, he thought, where artists of genius find larger recompense than in ours! Ah, there it is! "They order, said I, this matter better in France." Our neighbors' beef is always done to a turn. It is only our garden in which the weeds grow with exasperating luxuriance. Every thing goes well with our neighbors and wrong with us; and it is just our confounded luck. The excellent Mr. Gray packs his brushes and hies over the ocean to Italia, the holy land of art and the elysium of artists; and Signor Santa Trinita—if that be his name—the Florentine critic, congratulates Mr. Gray, as he arrives, that there is a Maresciallo Roberts in blessed America, where artists of genius find larger recompense than in his own Italy.

The signore is right so far as the buying of pictures is concerned, and, despite the traditions, he is perhaps right in regard to appreciation. Whether there are more Italians than Americans, in proportion to the population, who really enjoy fine pictures is at least a fair question. Of course in every Italian city where there is a great gallery there is an immense circle of students and connoisseurs gathered from every country, full of enthusiasm for art, and with much knowledge of it. And in the same cities there is a more distinct art society than in the country of the Maresciallo Roberts. But should the foreign members of that society withdraw, and leave the Pitti and the Uffizi, for instance, to the Florentines, those noble halls might become almost like those of Tadmor in the desert. There are multitudes of fine pictures in New York, but it is a public misfortune that they are placed in private galleries. These, indeed, with very few exceptions, are easily accessible to the friends of the owners, and to those who are properly introduced. But when the student recalls the Vatican and the Louvre, and the Dresden Gallery and the Pitti, he perceives the immense advantage of the free public exhibition.

And what that might be in this city of large recompense to artists of genius has been shown in the exhibition of the Metropolitan Museum of Art. During the winter there have been public free days, and the throng has been constant and enormous. And a more interesting collection is not easily found. The Di Cesnola Gallery, from Cyprus, of statues, glass, and pottery, the Chinese and Japanese collections, the porce-

lain and *bric-à-brac* of every kind, and the gallery of pictures, old and new, filled the spacious and beautiful building of the museum with never-ending wonder and delight for the ceaseless crowds. Very many of the most valuable and interesting objects were merely loaned. But one of the designs of the museum is loan exhibitions, which open the private collections to the public eye, and assure the public the sight and the study of the most interesting objects of art. It is in this way, by the intermediary of such a museum, that the advantages of the public galleries in other countries are to be enjoyed in this.

The fact of a general interest in art among richer men in this country, which is perceived by the desponding Florentine critic, is beginning to be understood elsewhere. When General Di Cesnola, our consul in Cyprus, made his remarkable excavations, and revealed the treasures of Phœnician art, which are undoubtedly by far the most interesting recent contribution to art history and knowledge, unless the Trojan discoveries of Dr. Schliemann may rival them, all European connoisseurs were on the alert, and the British Museum hoped to drive a hard bargain with the discoverer. The collection was stored in London, and after proper belittling of its value, and the exclusion of competing buyers, it was supposed that these wonderful relics might be cheaply added to the British collection. But at that very moment another citizen of the country of large recompense to artists of genius—not

the Maresciallo Roberts, but the Ill'mo Signor Giovanni Taylore Johnston—suddenly appeared, and by a most liberal offer to the general procured the transfer of his collection to New York, while the British Museum gazed aghast upon the prize slipping from its ungenerous grasp, and the London *Times* exclaimed, "For the early history and development of classic art and worship, the migration from shore to shore of the Mediterranean of mythologic forms and ideas, their growth on successive soils, the points of contact at which we may detect Assyrian and Asian thought and work strayed from their continents, and receiving a new impress from the hand of a new race—for the study of all this, General Di Cesnola's collection affords the amplest materials.The Lang Collection" (in the British Museum) "is not worthy to be named in the same year with it, and it is a European misfortune that it should cross the Atlantic."

This is not a treasure to be hidden, and the ill'mo signore whose property it is will transfer it to the Metropolitan Museum upon repayment of the actual cost, he himself, as the president of the museum, making a princely subscription toward the purchase. Indeed, it is in observing the appreciative and generous spirit of such men in the cultivation and advancement of art that we understand why the Florentine critic despairingly describes this happy land as "the country where artists of genius find larger recompense than in ours."

Editor's Literary Record.

BIOGRAPHY.

IT is strange that we have had to wait so long for a popular biography of one of the greatest of American pulpit and platform orators—a want at length well supplied in O. B. FROTHINGHAM'S *Life of Theodore Parker* (J. R. Osgood and Co.). He who desires to study the life and character of this marvelous man will find fuller material in the larger work of John Weiss, and more copious extracts by far from Mr. Parker's unpublished writings. But for those who wish only to read the story of his life, to get a picture of his character, not to fashion one out of materials afforded to them, Mr. Frothingham's smaller and less intricate volume will be much more serviceable. We speak of Mr. Parker as one of the greatest of pulpit and platform orators, without undertaking to sit in judgment upon the correctness of his philosophy, the soundness of his theological opinions, the wisdom of his methods and his spirit, or even the spirituality of his real inner religious character. There are few men who during the present century have contributed more to make the present American political and religious opinions what they are; and those who think his influence to have been evil and those who think it to have been good must concur in the opinion that it was effective. Whatever he was, he was not insignificant. The student of religious and political development in the United States during the last half century knows very little what it is who does not estimate the formative force contributed by the singularly original and powerful mind of Theodore Parker. Mr.

Frothingham performs one important service well, alike for his readers and for the fair name of the subject of his biography. He opens to us Mr. Parker's inner life, and it is one of which his outer life gives little hint. He is here no longer a warrior, no longer an iconoclast. He lays aside his armor, and we find him with a woman's tenderness, with, also, innumerable indications of a woman's piety. In no true sense of the term was he a rationalist; that is, his faith, with a tenacity which conflicts did nothing to lessen, clung to the truth of an ever-present and an ever-helpful God; and while he denied vehemently all that which to our common faith makes historical Christianity, he clung all the more vehemently to the truth of a present inspiration. His spirit and his faith were the antipodes of modern materialism. His industry, too, was untiring, his application immense. In this respect his biography is a wonderful stimulant. It sends us back to our work with newly kindled ambition to do, to get the full benefit of all the hours and all the moments. His courage was admirable. Possibly he would have done more if he had dared less; certainly the gulf which separated him from the clergy of his day would have been narrower if he had been threatened less. His combativeness—such, at least, is the impression which this biography produces—was not the pachydermatous skin of the rhinoceros, it was the coat of mail which a peculiarly sensitive nature put on in public combat, for his own protection. If he had felt the bitterness of the battle less, he would have fought it less bitterly.

Mr. Frothingham may fairly be regarded as a disciple of Theodore Parker, at least in so far as one truly original thinker can be the disciple of another. He has a disciple's admiration for the master, and, save in some casual criticisms upon Mr. Parker's style, scarcely intimates that he had a fault—nay, will scarcely admit one. The estimate he gives of Mr. Parker's character in the closing pages is not an analysis, it is a eulogy. Mr. Frothingham is not a critic, but a lover. This detracts nothing, certainly, from the interest of his pages, and scarcely from their trustworthiness, for Mr. Frothingham gives us ample materials from Mr. Parker's letters and journals for the construction of our own idea of his character. If the reader is not satisfied with the portrait, the original is before him; he can study it for himself.

A quite serious defect in this biography is the vein in which the author writes of other preachers. It was neither wise nor in good taste to speak slightly of others in order to magnify Mr. Parker. We doubt the moral discrimination of one who can describe the Unitarians, under the leadership of such men as Channing and Robbins and James Freeman Clarke, as "about as complacent a set of Christians as ever took ship for the kingdom;" or can accuse these men of moral cowardice because they refused to abandon life-long convictions to follow the leadership of the new apostle; or can characterize the sermons of Newman Hall as "Sunday-school addresses," or Spurgeon as a "man powerful through his sectarian narrowness;" or, comparing Theodore Parker and Henry Ward Beecher, can declare, "In moral earnestness he [Parker] was so vastly before him [Henry Ward Beecher] that the two men can not be spoken of in the same breath. Beecher entertains the country; Parker instructed and moulded it." But some allowance must be made for the enthusiasm of a lover for his idol, and the reader will find Mr. Frothingham's biography of Theodore Parker rather more entertaining and no less instructive because pervaded by such an enthusiasm, which the reader must moderate by his own calmer and more critical judgment.

Two volumes of biography add something to our knowledge of the civil war. *Lincoln and Seward* (Sheldon and Co.), by GIDEON WELLES, affords some remarkable revelations of the interior history of Mr. Lincoln's administration. It was called forth, at least in part, by the address of Mr. Charles Francis Adams; and in reply undertakes to show that "Mr. Lincoln was himself the great central figure and controlling mind in his own administration, and that neither Mr. Seward, Mr. Chase, nor any other of his able counselors was the 'power behind the throne.'" Mr. Welles was a member of Mr. Lincoln's cabinet, and thus is able to write of conferences of which there is elsewhere no record, to afford a secret history that else must have been unwritten. And in so far as this book is a defense and even a eulogy of Mr. Lincoln it is both an important and a welcome addition to the history of the country. But it is more than this. It is a serious indictment of Mr. Seward. It accuses him of conduct which not only quite unfitted him for his place as Secretary of State, but which would have justified his arrest and trial for high treason. For he is directly charged,

not only with resorting to a proceeding which "in all its parts was irregular and disorganizing," in order to prevent the reinforcement of Fort Sumter, and to maintain at every hazard the peace policy to which he was personally pledged, but also with having telegraphed the information to Governor Pickens of South Carolina, when in the cabinet it was decided to reinforce the fort, thus defeating the design. This was nothing short of treason; and such a charge preferred against such a man requires strong evidence in its support. We shall not here spread out in detail the charges which Mr. Welles brings against Mr. Seward, of which this is, perhaps, the most serious. We can only say that since Mr. Welles was silent concerning these matters so long, it would have been better to have kept silent to the end. Mr. Chase, Mr. Stanton, Mr. Seward, Mr. Lincoln, are in their graves. There is no one able to defend Mr. Seward. He is himself silent, defenseless. If the private conferences of the cabinet were at any time a proper subject for public disclosure, it was surely during the time when those most seriously affected were living, and could have responded to the accusations here preferred against one who was accounted one of America's greatest statesmen. It can add little to Mr. Lincoln's fame, it can add little to trustworthy history, to call from that past an old man's recollections of incidents and an old man's impressions of characters, when they who could have corrected his misrecollections or neutralized his prejudices are no longer living to do so.—*Military Biography* (Henry Holt and Co.), by CHARLES CORNWALLIS CHESNEY, a colonel in the British army, is a republication from the English. It consists of ten papers, four of which are sketches of generals and their campaigns in our civil war. To American readers this portion of the book will be the most interesting. The contrasted memoirs of Grant and Lee are exceedingly interesting. Mr. Chesney ranks General Grant higher as a soldier than many American critics would rank him, while severely criticising his Richmond campaign, and gives large praise to General Lee, whom he compares to Napoleon, Hannibal, Raglan, and Cæsar, though he criticises him for faults which seemed "trifling matters" at first, but as the war went on "were hardly less fatal to the fortunes of the South than the greater material resources of her adversary." His commendation of General Halleck as a disciplinarian is very earnest; to the winning process to which General Halleck had subjected the Army of the Potomac he attributes largely its final success. He writes of all in an impartial vein as a purely military critic, and as a disinterested spectator gives perhaps a truer, because a more unprejudiced, account of the great military leaders on both sides than could be given by one whose political sympathies were strongly enlisted with either.

NOVELS.

Ninety-Three, by VICTOR HUGO (Harper and Brothers), is both romance and history. We do not assert that the history is altogether trustworthy. What modern history is so? But it is certainly graphic and instructive. The reader will find here a marvelous series of pictures of France during the Revolution—the streets of Paris, the

course of trade, the effects of paper money, the Vendean war. In these descriptive chapters Victor Hugo has accumulated the results of much study. His descriptions are marvelously minute and realistic. His sympathies are more Catholic than we should have anticipated. The hero of the story is a royalist, or, if Gauvain, not Lantenac, be considered the hero, he is a recreant revolutionist. If Victor Hugo had given only a history of the Revolution, it would be intensely interesting. But as parentheses these historical chapters are sometimes long. In spite of their interest we skip them to follow the thread of the story. For *Ninety-Three* is also a romance; it is even a melodrama. The plot is too marvelous even for the credulity of imagination. But we follow it with unstinted interest to the close. The battle at La Tourgue, the escape of the imprisoned defenders through the secret door, the doom of the three little children, their rescue by Lantenac, and his final escape and its result—in all this scene follows scene so rapidly that we have no time to question till the curtain falls and the drama is ended by the quite too tragical deaths of Gauvain and Cimourdain. Not till we have followed the plot to its consummation do we go back to study in detail some of the pictures. They are worth our study. The conflict between the loosened cannonade and the gunner in the hold of the *Claymore*, the Convention hall and the Convention itself, the three little children playing in the tower of La Tourgue while the preparations for the bloody strife go on—these are marvelous specimens of word-painting. Grant that the drama is unreal, grant that the plot is improbable, grant that the style is sometimes forced and the epigrams tediously brilliant, grant all that the critic can find to say and has found to say against the author of *Les Misérables* and *The Man who Laughs*, it yet remains true that he is a great novelist, his very faults are the faults of genius, and his *Ninety-Three* deserves to rank among the most notable in its illustrations both of his excellences and his failings.

Phineas Redux, by ANTHONY TROLLOPE (Harper and Brothers), is a sequel to *Phineas Finn*. He is summoned from his retirement in Ireland to re-enter political life, accepts the summons, enters the political campaign as a candidate for Parliament for the borough of Tankerville, is beaten by Mr. Browborough, contests the election, proves his opponent guilty of bribery, and secures his seat. He is not, however, politically successful; his impolitic honesty, and still more a certain vacillation of purpose, which is not compensated for by allegiance to his party, make his companions distrustful of him; and when his party comes into power he is left without the office which had been promised to him. This embitters as well as perplexes him; for he is without fortune, and is dependent on the rewards of office for his living. Meanwhile he is a greater favorite with the women than with the men. All befriending him, from his cockney landlady, Mrs. Bunce, up to the Duchess of Omnium; and two are seriously in love with him. One of these last being a married lady, he is involved in some trouble in consequence; and his love affairs, for which he is in truth hardly responsible, affect disastrously his political prospects. At length a hot quarrel at the club with a successful rival,

not in love but in politics, is followed closely by the latter's death from violence; suspicion points to Phineas as the perpetrator of the crime, and he is transferred from Parliament to prison. Prior to this the story has gone somewhat heavily; but from this point the reader's interest is not allowed to flag. The accumulation of circumstantial evidence against Phineas, the estrangement of most of his old associates, the devotion to him and the faith in him of his women friends, the trial, and his final acquittal through the labors of one, whom he subsequently marries—all this is managed by the novelist with great skill, and in such a way as suffers neither our attention to be withdrawn nor our incredulity to be awakened.

But, as in most of Mr. Trollope's novels, the interest of *Phineas Redux* depends less upon the plot of the novel than upon the vivid pictures of English life and society which the story enables Mr. Trollope to paint. The English election, the House of Commons, the politicians and their political wire-pulling—in brief, the inside operations as well as the outside appearances of English politics, are very graphically portrayed, and the portrayal is not encouraging to those who imagine that a king or a nobility would suffice to purify our Congress of its corruption.

In *Ivan de Biron* (Roberts Brothers) ARTHUR HELPS appears in a new character—that of a writer of romance. His stage is Russia, his era the latter half of the last century, from the death of the Empress Anne, under whom Biron or Biren rose to power, to the accession of Peter III., husband of Catherine II. Ivan de Biron, the hero of this story, is Biren's private secretary, and the story turns largely on his love affairs. As a novelist Mr. Helps is an optimist. There is not a real villain in the book. Exile to Siberia is regarded as a rather light affair, a compulsory vacation from the cares of office. Biren is only a severe and somewhat autocratic Russian minister; the cruelty which traditional history imputes to him is eliminated from Mr. Helps's portrait. The two young ladies, between whom Ivan is really greatly perplexed, are both estimable. Even the Empress Elizabeth is a very good sort of woman. There is genuine psychological interest in the story, as we should expect there would be, and dramatic interest, which we did not expect. But the barbarism of Russian life in the last century is too gross, and its politics and civilization are too remote from our own, to afford material for an interesting novel, and the historical instruction incidentally afforded is not very important to the American reader; how far its pictures are trustworthy it would require a fuller knowledge of Russian civilization than we possess to determine. They are certainly graphic and artistically effective.

Lord LYTTON's last novel, *The Parisians* (Harper and Brothers), must be regarded from several points of view, and the judgment of the critic will depend largely upon the aspect in which he regards it. As a love-story it is not a success. The writer himself seems to have had a certain consciousness of this fact, as one fore-ordained, and to have incorporated the loves of Isaura and Graham chiefly because a novel without love would be in violation of all the precedents. As a book of philosophy it is not superior to Lord Lytton's other productions. As a picture of life

in Paris it is quite in the vein of some of his earlier novels, though not quite their equal. We should say that he had attempted to delineate here Paris life as in *My Novel* he did depict English life. His picture is too large, and embraces too many figures and too widely diverse types of social life. But, especially in its portraits of the lower and middle classes, there is evidence of the skill of the artist—the skill in observation, description, and character sketching which has given Lord Lytton his place in literature.

The lines of division between first-rate and second-rate novels are so vague and indefinite that it is sometimes difficult to know just how to characterize a novel which is, like *The Blue Ribbon* (Harper and Brothers), not quite good enough to be called first rate, and too good to be summarily disposed of as second rate. There is freshness enough about it to excuse it for being neither very striking in plot nor very remarkable in style. The characters are drawn with very great skill. The villains are not stage villains, with their viciousness evident at the first appearance, and happily there are not many villains in the story. The author seems to be most at home in descriptions of humble life and in the delineations of lowly, true-hearted characters, and has evidently a thorough contempt for that not uncommon spirit of pride which turns the cold shoulder toward worth when it is not combined with social position and wealth. The "blue ribbon" seems to do rather an unnatural amount of work in the love-story, and it is hardly possible it could do so much service and remain after three years fresh and bright for the happy finale.

Pet; or, Pastimes and Penalties (Harper and Brothers), is by Rev. H. R. HAWES, who established himself in our affections by his *Music and Morals*. This book is quite a contrast to his former one in style and matter, being a description of the marvelous adventures of four English children, one of whom was a boy of a scientific turn of mind, who succeeded in taking the quartette into more dangers than one could imagine possible. How contagious the example might be for youthful readers we are in some doubt; but we are not in doubt about the advisability of allowing children, even in books, to apply to their parents such epithets as "stingy" and "mean;" nor do we think that they are generally capable of sitting in judgment upon the parental government, which this book would seem to encourage them to do.

It is not pleasant to be brought into association with pestilent diseases requiring, or seeming to require, such treatment as is described in *Desperate Remedies* (Henry Holt and Co.), by Mr. T. HARDY. It is not, alas! alone in fiction that hideous crimes are vainly perpetrated to cover other crimes. This somewhat complicated and tragical tale is an enlarged and laboriously constructed illustration of the admonition, "Be sure your sin will find you out."

There are "standards" in literature as well as in dry-goods, and Robert Carter and Brothers are sure to have among their juvenile publications an extra proportion of that quality. This month we have to speak of *Guiseppe's Home*, one of Miss JULIA A. MATTHEWS's "Dare to Do Right" series, a story of the rescue and conversion of a poor Italian boy; *The New Scholars*,

a sequel to *Mrs. Ashton's Girls*, by Miss JOANNA H. MATTHEWS; or, as our little folks call her, "Bessie-book Matthews," a story intending to impress upon young people the text, "Hallowed be Thy Name;" *Willow Brook*, sequel to *The Little Camp on Eagle Hill*, by Miss WARNER; and three English reprints, *Rockbourne*, by M. E. WEIR; *Maggie's Mistake*, a story of a school-girl's misconduct and her repentance; and *Between the Cliffs*, two stories illustrating the insufficiency of human help in trouble. The latter three are inferior to the former—a fact which is gratifying to American vanity. Our juvenile fiction compares more favorably with foreign literature than do our novels for older readers.

MISCELLANEOUS.

REV. STEPHEN H. TYNG, D.D., has been one of the most successful clergymen of the present generation. Adhering closely to his self-chosen work; interested and active in all moral reform, but never turning aside from the preaching of the Gospel of Christ to the individual heart, as the best means of both individual and social reform; an indefatigable worker in parish visitation, in Sabbath-school and mission labors, no less than in the pulpit; active and interested in ecclesiastical affairs, but only because of their relation to and bearing upon humanity, his success has been witnessed not only by his long pastorate, not only by his large congregation, and his well-organized and active Christian church, but by the many in his church and without it who owe to his public ministry or to his private counsel the word of advice that has led them out of perplexity, or of inspiration that has startled them out of spiritual slumber. When such a man tells us how he has achieved his success the counsel has a practical value that only such experience can give. *The Christian Pastor* (Harper and Brothers) is a report of a series of lectures delivered by him in the Boston University, and published at the request of the students and faculty. In it he considers the *object* of the Christian pastor, the *qualifications* of a Christian pastor, the *instruments* he is to employ, the *agencies and opportunities* prepared for him, and the elements of *power* and *real attainment* in the Christian pastor. He discusses preaching only incidentally; it is of the pastor's private and personal work he mainly speaks. He founds the whole true success of the clergy on the faith that the whole human race is divided into two distinct though not always easily distinguishable classes—those that are the children of God, and those that are without God. The object of the ministry is simply to bring men from the state of ignorance and sin into that of true knowledge and righteousness through Jesus Christ; faith in the Bible and a personal experience of Christ are essential to his success in this work; in other words, he is a representative of God, charged with the authoritative declaration of Divine mercy to sinful men, and in the apprehension of this commission and its discharge his true power consists. The warmth of Dr. Tyng's faith and his strong spiritual sympathy imbue this book as they imbue all his sermons and addresses, and the anecdotal character of the discourses, the abounding illustrations taken from his own experience, give it almost the interest and the value of an autobiography.

How to Make a Will (American Tract Society) is a very useful little volume, and one which we cordially commend to our readers' attention. The aversion to this necessary preparation for death amounts often to a superstition, and the common procrastination often results in leaving on the widow an amount of inevitable but trying and burdensome toil from which consideration should have shielded her, or leaving the orphan children to the tender mercies of courts and lawyers, and their little property to be divided among strangers. Mr. LEE enforces the duty of making a will both by religious and prudential considerations. He then proceeds to present a convenient summary of the general legal principles relating to wills, with extracts from the revised statutes of the different States, and he closes with some counsels respecting the time of executing a will, which, he urges, should not be postponed to the hour of death, and the proper provisions to be made in it for the wife, children, and others. We should take some exceptions to his counsels respecting bequests to benevolent objects, but the counsels are such that, whatever errors exist, each reader can easily detect and remedy them for himself.

Woman before the Law, by JOHN PROFFATT (G. P. Putnam's Sons), is a useful and long-needed treatise. It is a small volume of less than 150 pages. Its object is "to give to intelligent readers outside of the legal profession a reliable summary of the law" respecting woman, including the personal rights and rights of property of married women, the reciprocal rights and duties of both mothers and children, and the law both of marriage and divorce. The author, who is a member of the New York bar, does not content himself with a mere compend of our present laws; he also in many cases traces them back to their historic origin. His chapter on divorce we especially commend to the consideration of those who imagine that free divorce is for the better protection of the wife. The laity have long needed a clear, concise, compact statement of the law on this subject of woman's rights, free from professional technicality and from partisanship or prejudice—a statement, not an argument—and here they have it.

It is a curious sign of the recent development of commercial relations with Japan that Dr. T. C. HEPBURN has issued an abridged edition of his *Japanese-English and English-Japanese Dictionary* (A. D. F. Randolph and Co.), in the form of a pocket dictionary. Of our own knowledge we can only speak of the external aspects of the book. Its form is convenient, and its type is clear. But a Japanese friend and scholar to whom we have referred it commends it highly as both convenient and trustworthy for the student.

The most valuable paper in ELIHU BURRITT'S *Ten Minutes' Talks on all Sorts of Topics* (Lee and Shepard) is the autobiography with which it opens. This fills about one-fifth of the book. We wish it might be published separately, and distributed far and wide as a tract, especially among the young men of the so-called "laboring classes." The rest of the book is made up of various articles, most of which have already served their purpose in the daily paper or the monthly magazine. The world is more and more

learning to classify its literature. The functions of the book and the periodical are not the same, and the time when a widely useful book can be formed by the aggregation of newspaper or magazine articles has passed. Mr. Burritt's style makes him an admirable writer for the press; but this volume, apart from the autobiography, will be chiefly valuable to his personal friends, and as a personal memorial.

Diamonds and Precious Stones (Scribner, Armstrong, and Co.) is a translation from the French of LOUIS DIEULAFAIT, by F. SANFORD, and is illustrated by one hundred and twenty-six wood-engravings. These are not remarkable. The book contains a popular account of gems, a description of some of the more famous, and an account of gem cutting, gem engraving, and gem manufacture. The descriptions of the experiments for the production of *real* diamonds by artificial means is especially interesting. The author asks the question, "Is there any reasonable probability that the diamond will yet be produced artificially?" and answers it in the affirmative. He confesses that the result will be to the disadvantage of diamond merchants, but thinks their loss will be compensated by the gain of the rest of the world.

A Fast Life (Harper and Brothers) is a book to read in a railroad train. It gives something of an interior view of the railroad world. The author is connected with one of the great trunk lines, and knows whereof he writes. It is not a labored book; has no statistics, no rhetorical descriptions, no school-boy's eulogy of the genius of steam. It is just a simple, plain description of railroad life, with graphic, because true, pictures of the life and experiences of the conductor, the brakeman, the engineer, the fireman, the signal-tender, and the whole corps of officials, from the superintendent down. It is full of anecdotes, which vary from the grave to the gay, from the tragedy to the farce, with a little seasoning of romance, which we read with skepticism, but accept without incredulity, in so far as it represents the legends of railroad men. There is some sensationalism in the book, but less than there is in the life; and having read the book all through, we rise from its perusal with certainly a clearer and, we believe, a truer idea of the experiences of railroad men than we ever had before. For instruction the book would be better if it were a little more philosophically arranged. For "light reading" we know not that we should suggest a criticism on its somewhat fragmentary character.

Mr. SAUNDERS'S book, *Woman, Love, and Marriage* (G. W. Carleton and Co.), is a curious specimen of mosaic-work. Quotation marks are as plentiful as commas, and we are as much charmed with the skillful combination of the numerous and well-selected passages from authors of almost every age and nation as with the thoughts themselves. Like an India shawl, the great pattern is made up of many small and daintily wrought bits. And it is no mere collection of mawkish sentiments. It utters a clear and vigorous protest against the immoralities which threaten domestic peace—a protest all the stronger because it is not a solo, but the harmonious burst of an orchestra, which Mr. Saunders skillfully and gracefully conducts.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

THE *Astronomical Record* for March includes the death of two very eminent astronomers of Europe. On the last day of the month, at Gotha, passed away P. A. Hansen, at the age of eighty-two—a man of rare vigor of body and mind, and who has exerted a strong influence on the development of astronomy. His greatest works, those relating to the movements of the moon, the perturbations of the planets, and to geodesy, will ever hold the first rank. His literary activity began in 1822, and continued uninterrupted to the last week of his life. On the 14th of March died J. H. Mädler, at Hanover, at the age of eighty. Mädler will be long remembered by his excellent map of the moon, executed some forty years ago, yet still the standard, although the unpublished one of Schmidt probably surpasses it in its elaboration of some details. Mädler retired from the directorship of the observatory at Dorpat in 1867. The death of Quetelet, at Brussels, on the 17th of February, at the age of seventy-eight, should also here be mentioned. Astronomy, meteorology, and statistical science have been equally cultivated by him, but it is in the latter that he appears as a great discoverer, and laid the foundations of the social and political sciences upon a sure basis of induction from actual observation. We pass by a step from the consideration of the life of each scientist to the study of the progress of that knowledge to which each individual life serves to contribute its mite. No finer illustration of this can be found than in the two volumes just published of Todhunter's *History of Mathematical Theories of Attraction*, which present an invaluable mine of historical and scientific knowledge to those interested in the development of all the exact sciences since the days of Sir Isaac Newton. American astronomers will be pained to learn of the resignation of Dr. Francis Brünnow, Astronomer Royal of Ireland, and director of the observatory at Dunsink, where he has very successfully conducted numerous researches into the parallax of the fixed stars. Dr. Brünnow was, in 1857, the first astronomer of the observatory of the university at Ann Arbor, Michigan.

A recently published lecture by Lockyer on celestial chemistry presents in a very clear manner the results of his laborious investigations in reference to the constitution of the heavenly bodies. He finds that the distinguishing characteristics of the spectra of the simple and compound bodies can be very clearly defined, and that they must be most closely studied if we would hope by spectroscopy to arrive at precise knowledge in relation to the temperature and constitution of the nebulae and stars.

Mr. Ranyard, at the March meeting of the Royal Astronomical Society, has called attention to the fact that on the negatives of the photographs of the solar eclipse of December 12, 1871, as taken at Octacamund and another station 120 miles distant, there appears a minute partially transparent spot about nine minutes distant from the eastern limb of the sun, and in each photograph occupying identically the same place with regard to the dark details of the corona. The occurrence of this spot on all the negatives is

considered to show that it was certainly due to the presence between the earth and sun of a semi-transparent body, such as the nucleus of a comet.

Father Secchi, of Rome, states in a letter to the Paris Academy of Science that he has compared the solar radiation with that of the electric arc from a battery of fifty Bunsen's elements, and concludes that the heat at the surface of the sun is at least 230,000, and perhaps 300,000, degrees of Fahrenheit.

Professor Airy announces that at Greenwich Observatory over two hundred photographs of the sun's disk have been taken since the discontinuance of the Kew Observatory, and that the series will be maintained as far as possible. Among these he notices that two spots have been photographed on the very limb of the sun, where they have appeared as notches.

Professor Main, of Oxford Observatory, states that three-fourths of Sir John Herschel's general catalogue of double stars are already revised and printed. The completion of this, the great posthumous work of the distinguished astronomer, is confidently expected within a few months, and certainly no work could be more acceptable to the professional and the amateur observer. We presume that the publication of the similar work by Mr. Burnham, of Chicago, will not be consummated until after the appearance of Herschel's catalogue.

It is announced that Professor Schmidt, of Athens, has completed the compilation of a map of the moon's surface two meters in diameter, and of wonderful fineness of detail. This is the end of a work that has been continued during a large portion of the past thirty-seven years, and it is suggested that as Athens is too poor to provide for the full publication of so important a work, it should be undertaken by a subscription among astronomers. The literature relating to the moon has been enriched by the beautiful work of Messrs. Nasmyth and Carpenter.

The discovery of a new asteroid is generally announced in each of our monthly reviews of the progress of astronomy, and this time the honor belongs to Palisa of Berlin, who has discovered the last, number 135, as announced by a Smithsonian telegram of March 19.

The Royal Astronomical Society has received from the widow of John Thompson a manuscript table of the logarithms of all numbers up to 120,000 computed to twelve places of decimals by her husband. It is expected that these will form a valuable check upon the accuracy of the larger logarithmic tables now in use, and that they will be specially valuable should a new edition of any of these be printed.

The preparations for the transit of Venus continue to be busily made. Our government has secured the valuable services of Dr. Henry Draper to supervise the details of the photographic parties, and we learn that he urges, as did Hansen a few weeks before his death, that the daguerreotype process be employed. It seems to be decided that the spectroscopic method of observation will be specially tried by the Italian and French observers.

In *Meteorology* we notice a communication by R. H. Scott, the director of the London Meteor-

ological Office, who gives the result of some attempts to establish a relation between the velocity of the wind and its force or pressure. He finds the scale given by Schott of Washington to agree very closely with his own, and proposes for general adoption the Beaufort scale of twelve grades of wind, with their titles, and supplemented by adding the corresponding velocities deduced by himself. The velocity corresponding to the twelfth grade, or the most violent hurricane, he puts at ninety or more miles per hour.

Muhry, in his latest contribution to orographic meteorology, concludes that at the equator, and perhaps over the whole earth, there is a stratum of air in the state of almost or quite complete saturation at a distance above the earth's surface.

From two recent articles by Hann on the reduction to sea-level of the observed atmospheric pressure we conclude that for the daily use of the practical meteorologist in the prediction of the weather such a reduction is at present impossible for stations as high as fifteen hundred feet without introducing a very large percentage of error, but monthly and annual means can be reduced for general climatological purposes.

Osnaghi, the meteorologist of the Austrian governmental system of weather predictions, describes an automatic self-registering weighing evapometer and rain-gauge, by which he hopes to obviate some of the hinderances to the observation of these highly important meteorological elements.

We include in our meteorological section a notice of a self-registering thermometer that, though invented by Messrs. Negretti and Zambra for use in obtaining deep-sea temperatures, will yet doubtless find numerous applications in meteorology. This self-registering thermometer contains nothing but mercury—neither alcohol, air, nor indices; it is by upsetting the instrument at a particular moment in a particular spot that we obtain, by the displacement of the mercury then in the indicating column, a means of preserving the record of the temperature, so that it may be subsequently read off at leisure. In this connection it should be added that it has recently been abundantly established that to Messrs. Negretti and Zambra is due the invention of the so-called Casella-Miller thermometer, now so much used in deep-sea soundings.

The Meteorological Committee of the London Board of Trade began on the 15th of the month to re-introduce the Fitzroy storm-warning signals that have been so long disused. The new signals are so arranged as to show the direction of the approaching gale, and in this respect will prove a very great improvement over those used in all other countries. It is stated that the direction of the wind may be foretold much more reliably than the force can be.

To the slight earthquakes of those portions of the United States where such phenomena are not uncommon we have to add the unwonted activity in the Appalachian range, as shown by the occurrence of over sixty slight shocks during the latter half of March. These seem to emanate from the region of the so-called Bald Mountain of North Carolina.

In a very excellent work by Angus Ross, of Halifax, there appears an attempt to arrive at some of the laws that have controlled the formation of the mountain chains of the earth. He

asserts that a careful examination shows that these chains are arranged in parallel lines along certain belts or zones which girdle the earth in great circles, and each zone having for its medial line or axis a line of volcanoes.

Professor Thurston announces that iron and steel, if strained beyond the limit of elasticity, and left under the action of the disturbing force which has been found just capable of equilibrating their power of resistance, gain resisting power to a degree which has a limit in amount approximating closely, if not coinciding with, the ultimate resistance of the material.

In *Inorganic Chemistry* several papers worth noting have been published. Some of the rarer metals have attracted special attention, Atterberg having continued his investigations among the glucinum compounds, while Cleve has been studying thorium. Cleve especially has obtained good results. He describes many compounds of this rare metal, redetermines its atomic weight, which he gives as 234, proves it to be tetratomic, and shows that it is not isomorphous with any other element.

Two papers regarding meteorites have appeared quite recently. One, by Lawrence Smith, describes the mass of iron which was found buried in the soil in Howard County, Indiana, in 1862. It contained 87.02 per cent. of iron and 12.29 of nickel, with minute quantities of cobalt, phosphorus, and copper. No signs of any Widmannstätten figures could be found in it. The other paper, by Apjohn, treats of the meteoric stone which fell at Adare, in the county of Limerick, Ireland, in 1810. In this stone small traces of vanadium were detected. This rare substance had been found by Apjohn in many trap rocks, and the chemical similarity of the meteorite to these led him to look for the vanadium beforehand.

Ritter has re-examined the so-called "black phosphorus," long supposed to be an allotropic modification of the element, and found it to be really a compound of phosphorus with arsenic.

Handfield Morton has published a paper upon the silicon in cast iron. He regards it as being combined to form iron silicide, and does not think it occurs in the metal mechanically mixed.

Electrical action in the induction tube continues to be much studied. By the action of electricity upon a mixture of hydrogen and carbon monoxide Brodie has performed the synthesis of formic aldehyde. Details are promised to appear in the future. And Messrs. P. and A. Thénau, submitting acetylene gas to the electrical effluvium, have obtained a remarkable white solid having the same elementary composition as the gas, and probably polymeric with it. They also obtained a liquid modification (polymer?) of acetylene.

In the department of *Mineralogy and Geology* interesting announcements are made by Dr. Zittel in reference to the geology of the Sahara. This gentleman is an associate of Dr. Gerhard Rohlfs in his exploration of the Libyan Desert, and in the course of his labors he has found reason to indorse the hypothesis of other geologists, to the effect that the Sahara is an upheaved bed of an ancient sea or ocean. Lines of cliffs are still visible, marking the borders of this sea, and showing the unmistakable erosion occasioned by its waves.

Mr. A. W. Chase presents an account of the beach mining for gold in Northern California, the sands of that region being highly auriferous, and furnishing a profitable yield. The gold is thought to be derived principally from the wearing away of the cliffs lining the shore, the material being restratified on the beach.

Dr. Gabb announces that the gold-bearing deposits of Central America, or at least those of Costa Rica, are of tertiary and probably of miocene age, and not silurian, as maintained by Murchison.

A paper by Professor J. P. Cooke, Jun., on vermiculite constitutes a valuable addition to mineralogical science, and, like that on corundum by Professor Genth, is one of the most exhaustive mineralogical papers of the day.

A new mineral from Norway has lately been described by Von Kobell, under the name of tschermakite.

To the other features of the American Centennial Exhibition is to be added the exhibition of a collection illustrating the mineralogy, the metallurgy, and the economical geology of the United States, and a committee has been appointed to take this subject in charge. Under the auspices of such men as Professor Raymond, Dr. T. Sterry Hunt, Professor Newberry, Professor Leslie, and others, we may be sure of a satisfactory presentation of the subject.

In *Geography* we have nothing particularly startling since the confirmation of the death of Dr. Livingstone. His remains reached England April 15, and on the 18th the funeral services were held in Westminster Abbey.

The explorations now on foot in Africa are not meeting with much success, owing to the inhospitable nature of the climate, and other causes. The Livingstone search expedition *via* Zanzibar, under Lieutenant Cameron, has been much broken down, and its efforts are now to be devoted to securing the papers left by Dr. Livingstone at Ujiji. The Grandy expedition, by way of the Congo, at latest advices had also been interrupted, in consequence of the death of the larger part of its members. The exploration of Rohlfs in the Libyan Desert appears to be moving along satisfactorily. It had reached the oasis of Dachel, in the Sahara, with its population of 10,000 inhabitants, and at latest reports had started out to another oasis fifty miles distant.

The hydrographic surveys of the British expedition in Eastern Africa are continued in two vessels. These, however, are not provided with specialists and apparatus for prosecuting biological researches, as should be the case.

A recent exploration of the Hang-kiang, by the Abbé David, proves it to be a river of great value and of much importance in the internal trade of China—much more so than had been supposed. The exploration by the Russian government of the river Oxus from recent announcements is supposed to be under way. This will embrace many hundreds of persons, and is intended to open up trade in that region, as also to secure an accurate knowledge of the geography and natural history of the country.

At the latest advices the *Challenger* had reached Melbourne from the Cape of Good Hope, having touched at Kerguelen's Land, M'Donald's Island, etc., and penetrated in the antarctic region to the latitude of 66½°.

From present indications there will be no arctic exploration during the current year on the part of the British government, the efforts of those interested in bringing about this result having been fruitless. It is, however, hoped that 1875 will witness the execution of this desirable labor.

The Bulletin of the Geographical Society of Paris contains a map and commencement of the narrative of the explorations of Mr. Alphonse Pinart in Alaska, the portion published referring more particularly to a journey to Atcha and to Kodick, resulting in the discovery of a bay called Pinart's Bay, on the south side of the peninsula of Aliaska.

Professor Orton, as already announced, has returned from his expedition in South America, and has brought back large collections in natural history and ethnology, upon which he will report in due season.

Under the head of *Microscopical Research* we make reference to the annual address of the president of the Royal Microscopical Society, Charles Brooke, Esq., F.R.S., in the March number of the *Monthly Microscopical Journal*, which presents few topics of interest. The aspirations of the society, now that it rejoices in the royal prefix, to have rooms allotted to it by the government in Burlington House, like the other royal societies, have not yet been gratified. The president calls attention to Dr. Pritchard's paper, in the April (1873) number of the *Journal*, on the structure and functions of the rods of the cochlea in man and other mammals. The cochlea may be considered as a tube spirally convoluted upon itself, and, the axis of the whorl being considered as vertical, divided horizontally into two portions by a thin plate, partly bone, partly membrane, the latter consisting of an immense number of fibres, on which rest the outer ends of the rods of the cochlea ("rods of Corti"), their inner ends resting on the bony portion of the spiral lamina. They are in double series, jointed together at an angle, and some five thousand in number; and the nerves of the cochlea are equally numerous, supplying probably a fibre to each rod. The vibrations are caught and collected by the auricle, and transmitted to the drum, and across the tympanic cavity to the internal ear by means of the chain of little bones. The direction of the sound is probably determined by the semicircular canals, but to distinguish the note it must pass on to the cochlea. There is a rod probably for each tone and semitone, and even for more minute divisions, so that the cochlea represents a finely constructed musical instrument, similar to a harp, the strings being represented by the rods; and just as, in the case of two harps tuned in unison, the sound produced by one will set in motion the corresponding string of the other, and cause it to vibrate and emit the same sound, so will a sound of any particular pitch be specially impressed upon some particular rod, and thence through the nerve fibres to the brain. The idea of a special rod thus tuned to each sound is ingenious, and if true, readily explains the difference of susceptibility of different ears in appreciating sounds.

The claims of Dr. Piggot with regard to the "Aplanatic Searcher" are summarily disposed of by Mr. Brooke.

At the Vienna Exposition neither American

nor English objectives were exhibited for competition. Of the foreign competitors the first rank was assigned to Hartnack, Gundlach and Nobert closely following. Probably M. Gundlach's objectives made in this country are superior to those shown in the Exposition.

A new contrivance for preventing a drop of fluid under examination from evaporating is described by Messrs. Dallinger and Drysdale in the March number of the *Monthly Microscopical Journal*. It appears to be somewhat complex, and as not possessing advantages over other well-known contrivances for the same purpose of a simpler kind. But their papers on the "Life History of Monads," published in the last four numbers of the *Journal*, are worthy of careful perusal, and prove them to be competent and trustworthy observers. Their researches show, as they think, "that the assumption that the germs of putrefactive organisms must perish in the same conditions that destroy the parents is erroneous." Scientifically we can see no reason why the bacteria should be held to be more likely to grow spontaneously than any other of the less minute forms whose life history our present appliances enable us to work out.

In the department of *Zoology* we have an elaborate presentation of the views of Professor H  ckel in reference to the genesis of animal life on this globe. In his opinion all forms above the protozoa, and, of course, including the vertebrates, are the result of a gradual evolution from a primitive form, which he calls a *Gastr  a*, consisting of a simple sac, with an outer and inner layer, in which food was received and consumed.

Dr. Greef gives further details in reference to his new *am  boid* animal, which he at first called *Pelobius*, but which he now names *Pelomyxa*. This is a gelatinous object of varying magnitude, growing in the fresh-waters near Magdeburg and elsewhere.

Professor M'Cready, of the Museum of Comparative Zoology, has presented a paper to the Boston Society of Natural History upon the food of the oyster and upon a new parasite of the oyster—a valuable contribution to the history of this animal.

An article on the reproduction of the *Silurid  * of India calls attention to the fact that in certain genera the eggs are very few in number—from six to fourteen only—but of large size, and that these are held in the mouth of the parent until hatched out. This has been well established in reference to certain South American species also, the eggs in some cases being three-fourths of an inch in diameter.

The discovery of the fossil tooth of the *Ceratodus* in Queensland by Dr. Kreft has an interesting bearing upon the occurrence of this genus elsewhere as a fossil, and its existence as a living form in Australia.

Mr. Garrard has published a new classification of birds, based upon certain peculiarities of the muscular system, which he insists are quite as suitable in this connection as the palatine bones, the blood-vessels, and other bases of definition.

Professor Marsh has presented an interesting contribution to natural history in a paper upon the genesis of the horse, as based upon his own observations in the Rocky Mountains. He finds

the sequence unbroken through six or eight forms, and in succeeding geological ages from the eocene *Orohippus* down to the *Equus* of the modern epoch.

A recent list by Dr. Gundlach of the mammals of Cuba invites renewed attention to the remarkable paucity of species in that island. Of twenty-four kinds enumerated nineteen are bats, the remainder being made up of one *Solenodon* (an insectivorous mammal), three species of *Capromys* (porcupine-like rodents), and one manatee.

We should not omit to mention the announcement by Mr. Harger of the occurrence of a new genus of fossil spider in the coal measures of Illinois, named by him *Arthrolycosa antiqua*.

In *Botany* we record the appearance in the *American Naturalist* of a series of articles by Dr. C. C. Parry upon the plants of Western Wyoming, the result of his observations and collections in that region last year, concluding with descriptions of fourteen new phenogamic species. The most interesting of these is a pretty dwarf *Aquilegia*, with one-flowered stems only two or three inches high. The botany of the Rocky Mountains has now become quite well known, and its study will be greatly facilitated to the amateur botanist by the recent synopsis of the flora of Colorado, prepared by Professor T. C. Porter and Dr. J. M. Coulter, and published by the Department of the Interior in connection with the reports of Hayden's surveys. In this descriptions are given of all the genera and species which are not found east of the Mississippi (including a few new species), the plan being that of Watson in his flora of Nevada and Utah (Clarence King's Reports, Vol. V.), from which also much of the material is taken.

Dr. Wenzig has completed in *Linna  * a revision of the suborder *Pomaria*, in which he changes much of the familiar nomenclature of our botanical manuals, substituting the generic name *Mespilus* for *Crataegus*, and forming a new genus (*Phalacro*) for the common Washington thorn (*C. cordata*), and recognizing five American species of the June-berry (*Amelanchier canadensis*). Dr. Regel, of St. Petersburg, has likewise revised the genus *Vitis*, referring the northern frost-grape and the southern muscadine to the same species, and uniting with the northern fox-grape all the different forms of the summer grape (*V.   stivalis*). The treatment of the genus *Lespedeza* by Dr. Maximowicz in his study of the flora of Eastern Asia is more satisfactory, but American botanists have no right to complain of the absurdities which may be committed by others in a field which they themselves should occupy.

The attention of botanists has of late been especially attracted to the investigation of the apparently voluntary movements of sensitive plants, in order to discover if possible the character of the "sensitiveness" and of the organs concerned in it, and the means by which the movements are effected. The phenomena attending the "fly-catching" of *Dion  a*, *Drosera*, and *Sarracenia*, which have long been known simply as curious facts in nature, may afford a clew, it is thought, to some of the deeper mysteries of vegetable life.

Under the head of *Rural Economy* we have to chronicle further inquiries in reference to the

Phylloxera, or grape-vine louse, the latest suggestion being that of the well-known entomologist Ménéville, that it is not the cause of the disease, but simply its accompaniment, and that the real disease is an enfeebled condition of the circulation, which allows the development of this parasite. This corresponds to one of the theories in regard to the potato disease, which is generally accompanied by an enormous multiplication of the potato mite.

Riegel of St. Petersburg announces that the common wine grape is a hybrid between two species found both in the Old and the New World.

The potato disease continues to attract attention in view of recent ravages, and the Royal Agricultural Society of England has made a grant of money to Professor De Bary, of Strasburg, to enable him to continue his elaborate microscopic researches upon its development.

Mr. Shirley Hibbard, of England, thinks that the potato disease, whatever be its actual cause, is developed mainly in seasons when extremes of heat and cold alternate, attended with excessive moisture, and suggests a method which has been very successful during a trial of several years. This consists in laying roof-shaped tiles along the ground in rows about four feet apart, and placing upon them the seed potatoes and covering them with the earth taken up between the ridges. As a result the moisture is drained off very rapidly, and a body of warm air which is imprisoned in the tile tends to equalize the temperature, and produce the condition necessary to proper growth.

The subject of *Forestry* has lately come up in Congress in connection with the proposition to appoint a commission to investigate the subject thoroughly, and report what measures are necessary for the protection of the forests, not only with reference to the supply of timber, but also to the proper distribution of the rain-fall, and the avoidance on the one hand of excessive freshets, and on the other of extreme low stages of water. The movement was initiated by a memorial presented to Congress on the part of the American Association for the Advancement of Science by Mr. George B. Emerson and Dr. T. B. Hough.

M. De la Blanchère, of Paris, brings to notice a new and important branch of industry, consisting in the utilization of the feathers of the poultry-yard, which have been generally thrown away. He finds that the long feathers of geese, ducks, turkeys, and chickens may be worked up to advantage in the production of a feather batting, or cloth, by trimming off the fibrils of the longer feathers from the midrib, and their disintegration by shaking in a bag. When all the fibres are thus separated the material commands a ready sale at a good price for working up into blankets, cloth, etc.

The subject of *Fish-Culture* is attracting increased attention both among individuals and the States. Since our last report several States have appointed commissioners for this purpose, among which we may mention Maryland, Minnesota, Iowa, and Wisconsin. A meeting of the Fish Commissioners of New England was recently held at Boston for the purpose of deciding upon systematic measures for the improvement of the fisheries of their respective States.

New regulations in reference to the capture of the seals of the Pribilof Islands of the North

Pacific have lately been made, these consisting in allowing the Secretary of the Treasury to decide what proportion may be taken in the two islands of St. Paul and St. George. The previous law allowed the capture of 75,000 on one, and 25,000 on the other; but the proportion hereafter will probably be 90,000 for one, and 10,000 for the other.

In the department of *Engineering*, aside from a report of general progress upon the several more important works which usually receive notice in our monthly record, there is little to communicate.

The completion of the iron bridge over the Saco River at Biddeford, Maine, affords an admirable example of the American system of building iron bridges—that of interchangeable parts and pin connections—as contrasted with the system of connection with rivets. The bridge was built by the Phoenixville Bridge Company, and completed ready for traffic within forty days from the date of the order, at which time the iron lay in form of puddle bar. The bridge has three spans of 133 feet each and two spans of 100 feet each, and its cost was somewhat under \$40,000.

The report of the commissioners appointed by the Secretary of War to inquire into the practicability of bridging the Detroit River declares that a tunnel is the only unobjectionable method of meeting the necessities of the case. The plan of a bridge for winter use only, resting on pontoons in the centre and piers at the sides, which could be removed so as to leave a clear opening of seven hundred feet during the season of navigation, was also approved as offering no serious hinderance to navigation, though it would be only of use during five months of the year.

The much-debated question of an Anglo-French tunnel has assumed a new phase, in the form of a scheme to connect Great Britain and the Continent by means of a tunnel beneath the Channel, between Cape Grisnez and South Foreland. To effect this proposition a company has been established by authority of the French government, the council affirming the same, giving to it the designation of "un projet d'utilité publique." Whether this scheme will suffer the fate of its predecessors remains to be seen, although the recent constant agitation of the subject denotes the existence of a wide-spread belief in its importance.

The proposition to construct a railway which shall connect the Pacific Ocean with the valley of the Amazon is worthy of notice, since if consummated it will prove to be another of the marvels of engineering skill of which this century can boast. This stupendous enterprise is now in course of being carried out, and the projectors are our own countrymen. So far as finished, since its beginning in 1870, the work has already cost about \$33,000,000, and when completed it will probably cost as much more. To afford an adequate notion of the difficulties which have confronted the builders of a railway 17,000 feet above the level of the sea, it will suffice to say that to pass one single locality there were required thirty bridges and viaducts 3000 feet in length, and thirty-five tunnels 15,000 feet in length. One of its wonders is the great viaduct, the highest in the world, 580 feet long and 300 feet high in the centre. The heights of the three iron pillars

which support it are respectively 166, 183, and 253 feet. A force of from 8000 to 12,000 laborers is employed upon it day and night.

The recent launch, at Chester, Pennsylvania, of the colossal iron steam-ship *City of Peking* is an event which should afford a source of congratulation to all who feel interested in the progress of American manufactures. The vessel is entirely of iron, and, except the *Great Eastern*, her carrying capacity is greater than that of any ship afloat. She is built throughout of American materials, and is designed for the fleet of the Pacific Mail Steam-ship Company. The following data give her principal dimensions:

Length over all, in feet.....	438
Breadth of beam "	48
Depth of hold "	83½
Tons burden.....	5000

With the launching of this masterpiece of construction the success of the iron ship-building industry on the Delaware must be acknowledged as complete. Within two years no less than seventeen iron vessels have been completed at Chester alone, and this fact, taken in connection with the development of this industry at other points on the Delaware, notably at Philadelphia and Wilmington, indicates a condition of prosperity that is highly gratifying.

The statistics of our iron exports exhibit several points of a very favorable nature. The export of manufactured articles of American iron appears to be on the increase despite the stagnation of many branches of trade. In 1873 the export of our car wheels reached the number of 7515, having nearly doubled itself over the figures of the preceding year. The following figures exhibit the value of our exports of the more important articles of iron manufacture for the fiscal year ending June 30, 1873: Machinery, \$3,120,984; locomotives, \$952,655; nails and spikes, \$356,990; steam-boilers, \$232,546; castings, \$159,234; rails, 104,054; stoves, \$115,792; stationary engines, \$111,507; general iron manufactures, \$3,262,170; edge-tools, \$846,452; fire-arms, \$1,181,869; and general manufactures of steel, \$297,541.

The exports from Great Britain to the United States during the same period show a material decrease.

The following figures have just been published by the Pottsville *Miners' Journal*, showing the consumption of coal in the United States during the year 1873:

	Tons.
Anthracite sent to market.....	19,585,178
consumed in coal regions.....	3,243,000
Total production of anthracite.....	22,828,178
bituminous.....	22,015,784
Total.....	44,843,962

These figures show an increase of upward of 100 per cent. in the production of coal in the United States within the last ten years, and if the same ratio of increase should continue for the coming decade, the production in 1883 would reach 90,000,000 tons.

In connection with the subject of coal, it appears that during the past month disastrous fires have been raging in the Wilkesbarre mines, which necessitated the abandonment of one or more mines, and seriously imperils one of the most valuable possessions of the lately formed Wilkesbarre and Lehigh Coal Company.

Of mechanical novelties, aside from the establishment of the Phosphor-bronze Company in Pittsburg, and the fact that it is at present filling large orders for various railway companies, machinists, and others, the only novelty we may present is the curious discovery of Mr. Gustavus Ames, that by revolving an emery wheel at high velocity in contact with, but barely touching, a steel surface, the latter also being given a slow lateral or rotary motion, the surface of the steel is rendered extremely hard—so hard, indeed, in the instance which he related that neither cold-chisel nor prick-punch could perceptibly affect it, and a new file would slip over it without making a scratch. The hardening penetrated to the depth of one-sixteenth of an inch. The observation in question may prove to be of great practical value.

In *Technology* we have to notice that the Blair process of making iron and steel, which is now in operation on a large scale in Pittsburg, was the subject of a recent paper before the American Society of Mining Engineers. Its essential features consist in the production of an iron sponge, which is melted down in a bath of cast iron, and so treated that it shall result in ingots of any desired degree of carburization.

The trustees of the Stevens Institute of Technology, at the suggestion of Professor R. H. Thurston, propose to found in connection with the institution a laboratory for technical research, or a testing laboratory in which researches of a practical bearing upon the arts and manufactures shall be conducted—such, for example, as the determination of the strength of materials for construction, of the value of fuels, lubricants, etc.

Under the head of *Technology and Domestic Economy* we have an improvement in the automatic system of gas-lighting by Professor Klinkerfues, in the method of nickel-plating by Martin and Delamotte, the use of sulphite of soda in distillation, the use of charcoal instead of lime in removing hair from hides, etc.

Under the head of *Miscellaneous News* we may refer to the honors extended to Professor Newcomb, of the Washington Observatory, by foreign institutions, namely, in the decree of the Gold Medal by the Royal Astronomical Society of London, and his election as corresponding member to the Academy of Sciences of Paris. Admiral Charles Henry Davis has succeeded Admiral Sands in the charge of the National Observatory—a position which he occupied several years ago, and left for sea duty. Professor H. Alleyne Nicholson, a well-known biologist, who has for some years had a professorship of zoology at the University of Toronto, has been transferred to Dublin, and in a similar capacity.

Scientific meetings are already announced for the coming summer, among them that of the Social Science Association of New York on the 26th of May. Although not coming under this category, yet of great interest, is the intended celebration, with suitable ceremonies, on the 2d of August next in Iceland of the thousandth anniversary of the discovery of the island. It is proposed to make this an occasion of a contribution of books by various learned institutions in the United States, the Smithsonian Institution, Yale College, Cornell University, etc., having ex-

pressed their readiness to forward any thing that may be placed in their charge for the purpose.

The deaths since our last report have been numerous, and among them we have to refer to that of Professor Max Schultze, of Bonn, an eminent botanist and microscopist; Dr. Legros and F. Papillon, in Paris; Miani, the Italian geographer; Professor Quetelet, of Brussels; Mr. Jules Bourcier, the French specialist in humming-birds; Sir Francis Pettit Smith, the alleged discoverer of the screw-propeller; Mr. Stephen Harris, a mining engineer of Pottsville, Pennsylvania; and Rev. John Bachman, a naturalist, and associate with Mr. Audubon in many of his scientific papers.

ON THE PERIODICITY OF CLIMATES ON THE EARTH.

The question whether there are any other regular periods than the daily and annual in meteorology has, as is well known, attracted great attention of late years in connection with the supposed discovery of an eleven-year period coinciding with the increase and diminution of the solar spots. Such a period has been argued from observations of temperature, terrestrial magnetism, auroras, atmospheric electricity, and, finally, the recurrence of cyclones in the Indian Ocean. The most extended labor on this subject is, however, that of Dr. Kopfer, of the Physical Observatory of St. Petersburg, who has, with great labor, combined together an immense mass of observations of the temperature in order to establish his conclusions upon irrefragable bases. In his opinion, in which doubtless all coincide, it is absolutely necessary that observations should be gathered together from all regions of the world, and that our conclusions be not based upon a single series made at any station, or over any country. There seem to have been no observations of temperature made in any portion of the world that have not been used by him, so that his conclusion may be said to embody all that can be deduced from the present state of observational meteorology. Arranging the stations according to meteorological zones, the tropics and sub-tropics, the warmer temperate zone, the colder temperate zone, and the cold zone, he throws the mean temperature for each year and each zone into the graphic form of a curve, which can then be directly compared at a glance with the curve of sun-spots as deduced by Wolf from all known observations of the sun. At the very first one is struck with the great agreement of these curves. In the torrid zone the maximum of heat occurs from six months to eighteen months before the

spot maximum. To the north of the tropics the maximum of temperature occurs still later than the minimum of spots, being retarded even as much as three years. The regularity and magnitude of the variations of temperature are most beautifully displayed within the tropics, and diminish as we proceed thence toward the poles. The length of the period between the maximum temperature varies, as also does that of the sun's spots, so that, as the interval between the minimum and maximum of spots is almost always shorter than the interval between the maximum and minimum, so does the temperature follow a precisely corresponding change. The parallelism in the series of numbers is so great that there no longer remains the slightest chance of a mere accidental coincidence between these apparently independent variations. The two phenomena evidently are connected, but in what manner can not at present be determined. Only this is clear, that the sun's spots do not directly, through the darkened portion of the sun's disk, act like an eclipse, leaving the remaining portion of the sun's disk to shine upon the earth with undiminished intensity, for were this the case, since the temperature on the earth's surface is a summation of the total radiation from the sun, it would follow that the variation in the temperature would necessarily follow later than its cause—that is to say, the minimum temperature on the earth should, to a certain extent, follow the maximum number of sun-spots. The contrary, however, is the case, the number of sun-spots attaining its maximum after the corresponding maximum of temperature in the tropics, and it appears to the author most likely that the temperature of the sun's surface, from some unknown cause, is highest one or two years before the minimum of the solar spots. Regarding these spots as comparatively cold matter slowly melting away on the glowing surface of the sun, he remarks that it can not be surprising that the spots should occupy so great a time to completely melt when we consider their immense dimensions. He, however, finds no explanation of the remarkable fact that the retardation of the temperature on the earth's surface, with respect to the sun's spots, is greater near the poles than at the tropics, unless it have to do with the phenomena of the moisture in the atmosphere. To this subject, therefore, he proposes to direct attention. In conclusion, as the result of his studies into the appearance of extremely hot and cold years, he states that, according to the data now before him, there is reason to expect a very cold year, in 1875, in Europe.

Editor's Historical Record.

POLITICAL.

OUR Record is closed on the 22d of April.—The United States Senate, April 6, passed, by a vote of 29 to 24, a bill "to fix the amount of United States notes and the circulation of national banks." The House passed the same, by a vote of 140 to 102, April 14. The following is the text of the bill:

Section 1 provides that the maximum amount of United States notes is hereby fixed at \$400,000,000.

Section 2 provides that \$46,000,000 in notes for circulation, in addition to such circulation now allowed by law, shall be issued to national banking associations now organized, and which may be organized hereafter, and such increased circulation shall be distributed among the several States as provided in section 1 of the act entitled "An act to provide for the redemption of the three per centum temporary loan certificates, and for an increase of national bank notes," approved July 12, 1870. And each national banking association now organized, or hereafter to be organized, shall keep and maintain, as a part of its reserve required by law, one-fourth part of the coin received by it as interest on

bonds of the United States deposited as security for circulating notes or government deposits, and that hereafter only one-fourth of the reserve now prescribed by law for national banking associations shall consist of balances due to an association, available for the redemption of its circulating notes, from associations in the cities of redemption, and upon which balances no interest shall be paid.

The President vetoed the bill April 22.

The House, also, April 14, passed a currency bill, with the following provisions:

Section 1 provides that section 31 of the National Currency Act be so amended that the amount of money the banks are required to keep on hand shall be determined by the amount of deposits, and that they shall not hereafter be required to keep on hand any money whatever by reason of the amount of their respective circulations.

Section 2 repeals section 23 of the said act, and the several amendments thereto, so far as they restrict the amount of notes for circulation. It also repeals the second proviso in section 1 of the act to provide for the redemption of the three per cent. temporary loan certificates, and the amendment to the National Currency Act, approved March 3, 1865. Section 31 of the original act is re-enacted.

Section 3 requires each national bank to keep on deposit in the Treasury of the United States in lawful money a sum equal to five per cent. of its circulation, to be held and used only for the redemption of such circulation, and when such circulating notes shall be presented for redemption in sums of \$1000, or any multiple thereof, to the Treasurer or any Assistant Treasurer of the United States, the same shall be redeemed in United States notes. All notes so redeemed shall be charged by the Comptroller of the Currency to the respective associations issuing the same, and he shall notify them severally on the first day of each month, or oftener, at his discretion, of the amount of such redemption, whereupon each association so notified shall forthwith deposit with the Treasurer of the United States a sum in United States notes equal to the amount of its circulating notes so redeemed. And when such redemption shall have been so reimbursed, the circulating notes so redeemed, or if worn, mutilated, or defaced, new notes instead, shall be forwarded to the respective associations, provided that each of said associations shall reimburse to the Treasury the costs of redemption and of supplying new notes in place of those redeemed; and the associations hereafter organized shall also severally reimburse to the Treasury the costs of engraving and printing their circulating notes; and provided further that the entire amount of United States notes outstanding and in circulation at any one time shall not exceed the sum of four hundred million dollars now authorized by existing law.

Section 4 provides that any bank desiring to withdraw its circulating notes in whole or in part may, upon the deposit of lawful money, in sums of not less than \$10,000, with the Treasurer of the United States, withdraw a proportionate amount of bonds deposited in pledge for such circulation, and he shall redeem, cancel, and destroy an amount of the circulating notes of such bank equal to the amount issued upon such bonds.

Section 5 provides that sections 31 and 32 of the said act be amended by requiring that each of the said associations shall keep its lawful money reserves within its own vaults, at the place where its operations of discount and deposits are carried on; and all the provisions of the said sections requiring or permitting any of the said associations to keep any portion of its lawful money reserves elsewhere than in its own vaults, or requiring or permitting the redemption of its circulating notes elsewhere than at its own counter, except as provided for in this act, are hereby repealed.

Section 6 provides that upon all circulating notes heretofore issued, or hereafter to be issued, whenever the same shall come into the Treasury in payment or deposit for redemption or otherwise, there shall be printed, under such rules and regulations as the Secretary of the Treasury may prescribe, the charter numbers of the associations by which they are severally issued.

The House, March 26, passed the bill to regulate the commerce by railroad among the several States. The vote stood 121 to 116. The essential feature of the bill is the institution of a Board of Commissioners (representing the nine judicial

districts), who are, after investigation, to prepare for the owners and operators of inter-State lines of railway schedules fixing the maximum rates for freight and passengers.—On the 13th the Senate passed, 20 to 18, a bill to provide for the incorporation and regulation of railroad companies in the Territories. Mr. Senator Stewart, of Nevada, who introduced the bill, explained that its object was to enable the people in the Territories, who so desired, to build railroads with their own money, without applying for a charter to Congress or to a Territorial Legislature. The bill grants no public land except for stations, dépôts, and right of way.

In the House, March 31, the Senate bill providing for the payment of the bonds of the Louisville and Portland Canal Company was passed, with an amendment that no money shall be paid under its provisions until Kentucky shall have ceded the jurisdiction of the canal property to the United States. This canal around the falls of the Ohio has been in operation since 1831, the government during that time having been part owner. All expenses down to 1867 had been received back in tolls. Since 1869 the government had appropriated \$1,278,000, for which it had received no return. The bill appropriates \$1,172,000 more to take up and cancel bonds to that amount. The House amendment was defeated in the Senate April 21.

Both Houses of Congress have passed the bill exempting from the act of 1793—enrolling and licensing ships in the coasting trade—all canal-boats or boats employed on the internal waters or canals of any State.

A bill was passed by the House, April 15, abolishing mileage, and providing for the payment of actual traveling expenses.

The Senate has confirmed the appointment of Benjamin P. Avery as minister to China, *vice* F. F. Low, resigned; also that of Thomas Russell as Minister Resident to the republic of Venezuela.

M. Bertholdi, the French minister, and Postmaster-General Creswell have agreed upon the basis of a postal treaty between France and the United States, which will establish an international letter rate of nine cents, or fifty centimes, for each half ounce, each country to retain the postage collected therein, and to pay for the transportation of the mails to the other. Prepayment to be optional, but want of it to subject letters to a fine of five cents.—Formal ratifications of the postal treaty with Japan have been exchanged at Washington—the letter rate per half ounce being fixed at twelve cents.

Governor William B. Washburn, of Massachusetts, was by the Legislature of that State elected, on the thirty-third ballot, to fill Senator Sumner's unexpired term in the United States Senate.

The New Jersey Legislature has passed a compulsory education bill. A similar bill was defeated recently in the Illinois Legislature.

The bill passed by the Senate of the New York Legislature vesting the appointment of the Superintendent of Public Instruction in the Board of Regents was defeated in the Assembly April 14.—The bill for compulsory education was passed by the Assembly, 68 to 35, April 15.

The Rhode Island election, April 1, resulted in the re-election of the entire Republican State government.—In the Connecticut election, April

6, C. R. Ingersoll, the Democratic candidate for Governor, was elected.

Sir William Gray has succeeded Sir John Peter Grant as Governor-General of Jamaica.

In the British House of Commons, April 16, the annual budget was submitted. The total gross revenue amounted to £77,835,000, exceeding the estimates by £3,574,000. The total expenditure amounted to £76,456,000, including the Geneva award, but not the expenses of the Ashantee war. The excess of expenditures over estimate was £1,156,000. The estimate for revenue for the year ending March 31, 1875, is £77,995,000; for expenditure, £72,500,000, leaving a surplus of £5,495,000. It is proposed to reduce the income tax one penny in the pound, to abolish the duties on sugar from the 1st of May, to create additional terminal annuities to the amount of £450,000, to reduce the national debt £7,000,000 in ten years, and to contribute £1,000,000 of the surplus to the relief of local taxation and the abolition of horse taxes.

The Queen has sent a message to the House of Commons recommending a grant of £25,000 to General Sir Garnet Wolseley.

The new French electoral bill, elaborated by the Committee of Thirty, will reduce the electoral body by about 3,000,000 voters.

In the French Assembly, March 27, M. Dahirel, a monarchist, moved that a vote be taken July 1 to decide the future form of government. The motion was rejected by a vote of 330 against to 256 in its favor.—On the 28th the Assembly adjourned until May 12.—A circular has been issued by the French government prohibiting attacks by newspapers on the Septennat, and declaring that President M'Mahon's powers are incontestable.

Henri Rochefort and Paschal Grousset have escaped from the penal colony of New Caledonia. Rochefort proposes to come to America.

In the annual race between the Oxford and Cambridge universities' boats' crews on the Thames, March 28, Cambridge was the winner by four lengths; time, twenty-three minutes and thirty-five seconds.

NEW YORK SAVINGS-BANKS.

The report of the Superintendent of Banking on savings-banks is this year especially interesting as showing the results of the panic of last autumn. Five new savings-banks have been incorporated, the total number of banks, January 1, 1874, being 155, of which 71 are in Kings, New York, and Westchester counties. The total sum of deposits at that date was \$285,520,085. The increase in deposits during 1873 was only \$233,464, the smallest annual gain in sixteen years. The increase in the surplus amounts to \$1,672,088.

Notwithstanding the effects of the panic, the banks were in a stronger position on the 1st of January, 1874, than they had been January 1, 1873. In the proportion of surplus to liabilities the banks are stronger than they have been since 1866. The small depositors have continued the most steadfast in their patronage of the banks; for the increase in the number of depositors during 1873 was 16,830, while the average deposit was diminished \$6 67. It was the speculative class mainly who withdrew \$7,000,000 from these banks during the last half of 1873.

It was discovered by the bank examiners that in not a very few cases savings-banks are made the tenders of banks of discount. In some banks where such relations exist there is mutual advantage in their business, and the savings-bank gains by this intimacy. But generally the connection between the savings-bank and the discount bank is made to serve the latter, and to swell its gains to the loss of the former. In Albany and Troy this is notably the fact.

DISASTERS.

March 24.—Explosion of the boiler of the Mississippi tow-boat *Crescent City*, ten miles below Memphis. Sixteen lives lost.

March 25.—Tenement-house in Mott Haven, New York, burned. A mother and her three children consumed.

April 1.—A large part of Millerstown, Pennsylvania, destroyed by fire. Seven persons burned to death.

April 17.—Governor Kellogg, of Louisiana, writes to President Grant advising him that the unprecedented rise in the Mississippi, aided by violent local storms, had caused a most disastrous overflow. Six or seven of the largest parishes of the State were under water, and thousands of people, white and black, were without food or shelter.

March 31.—News received at London of the loss of the French steam-ship *Nil* on her way from Hong-Kong to Yokohama. Eighty persons drowned.

April 2.—Loss and abandonment of the French Transatlantic Company's steam-ship *Europe*, from Liverpool to New York. Crew and passengers saved.

April 9.—At St. Johns, Newfoundland, explosion of the steamer *Tigress*, of *Polaris* fame. Twenty-two men reported killed.

April 14.—Abandonment at sea of the French Transatlantic Company's steam-ship *L'Amerique*. Passengers and crew saved. Second captain lost. The *Amerique* was afterward towed into Plymouth Harbor, in good condition, hull and cargo.

April 15.—Colliery explosion, from use of naked lamps, at Dukinfield, in Lancashire, England. Fifty-three men killed.

OBITUARY.

March 8.—In Paris, Susan Virginia Benton Boilleau, youngest daughter of the late Senator Thomas Benton, aged thirty-nine years.

April 5.—In Paris, Charles E. Beulé, a distinguished archæologist, and member of the French Assembly, aged forty-eight years.

April 8.—At Munich, Bavaria, Wilhelm von Kaulbach, the distinguished German painter, in his sixty-ninth year.

March 27.—In Boston, Massachusetts, Rev. Edward N. Kirk, D.D., aged seventy-two years. —In Philadelphia, Pennsylvania, the Rev. T. Stork, D.D., a distinguished Lutheran clergyman and editor.

April 5.—In New York, Judge J. W. Edmonds, aged seventy-four years.

April 13.—In New York, James Bogardus, the well-known inventor, aged seventy-four years.

April 17.—In Salem, Massachusetts, Professor Alpheus Crosby, an eminent scholar and author, aged sixty-four years.

Editor's Drawer.

THE good Henry Bergh, whom every body knows and loves for his devotion to dumb animals, has much dry humor, which shows itself when least expected. The story of his commiseration for the feelings of the mule, instead of the drunken man who sunk on the animal's back in a bog, has already been made public. The following equally illustrate his wit:

General D— says that several years ago, at the time when Mr. Bergh first originated the Society for the Prevention of Cruelty to Animals, on waking up one morning his ears tingled with the piteous cries of an unfortunate cat, which, in climbing a tree in the general's yard in pursuit of some birds in a nest, had become permanently entangled in a branch about thirty feet from the ground. The general put on his hat and went to Mr. Bergh's office. Finding that gentleman in, he stated the case. Mr. Bergh touched a bell, and ordered the attendant at once to proceed with a long ladder and relieve the cat.

"Stop a moment, Mr. Bergh," said the general. "Is the cat entitled to any consideration? She went up the tree after the little birds."

"My dear Sir," replied the great zoophilist, "*let us not scrutinize too closely the motives of that cat.*"

And the ladder was sent.

Another good story of Mr. Bergh arose from his unsuccessful prosecution in Brooklyn of the swill-milk vendors. He presented several clear cases of the selling of this disgusting compound before the local courts there without success, political reasons combining to influence both court and jury in favor of the swill-milk "maids." Later a Brooklyn editor urged the propriety of his again interfering. Mr. Bergh replied, in substance, that however earnest his efforts had been to ameliorate the condition of the unhappy cows who were compelled by unnatural food to furnish *swill* milk, yet in view of the fact that a swill-milk court and jury had in Brooklyn unanimously declared that article to be a most wholesome drink, he did not feel authorized to renew his attempt to deprive the inhabitants of that deluded city of a legal beverage which their own tribunals had gravely decided to be alike healthful and invigorating, and he therefore left the matter to the local Board of Health.

And yet another: After Mr. Bergh's successful defeat of Ira Paine in his attempt to recover damages against him for stopping a pigeon match, in which sundry tame pigeons were proposed to be mutilated needlessly in order to determine a contest for a silver cup, a New York morning paper came out in a singular editorial, sneering at Mr. Bergh's affection for birds. "None of the pigeons are more thoroughly symbolical than the cock which crew thrice in the night, and whose crowing was of most significance to a person whose character no one admires. *Judas* went and hanged himself when he had heard the cock crow three times!"

"This mixing up of Judas and St. Peter is remarkable," said the good Mr. Bergh, on hearing of this article; "but I never heard of the devil yet quoting Scripture accurately, or without getting matters mixed. He is not used to it,

and he always gets things wrong whenever he attempts it."

For strict integrity and playful humor commend us to the following, sent to us by a gentleman in judicial position in Kansas. It should have been sent to the Finance Committees of both Houses of Congress pending the discussion of inflation:

"The town of C—, in Kansas, issued bonds for school-houses, bridges, railroads, etc., with great prodigality, until now the bonded indebtedness is nearly \$200,000, and the rate of taxation nine and a half per cent. No community can stand such taxation as that, and to avoid it the citizens have bought a quarter section of land adjoining the town site, laid it off into lots and blocks, and are moving every building from the old to the new town site. The old town site will soon be a deserted tract of 160 acres, with a bonded debt of \$200,000. The new town starts off with public buildings and private dwellings complete, and in fine running order, and without any bonded or paper indebtedness. They inflated the old debt as much as she could stand, and let her burst. But for the new town—not any!"

A GOOD many stories of stammerers are told, but none of recent date better than the following of Platt Evans, of Cincinnati: It was one of his pleasures to teach his friends how to purchase tender geese, though he could not always get them in the market. One morning he saw a lot, and inquired of the farmer how many there were.

"About a dozen," was the reply.

"W-w-well," said Platt, "I k-k-keep b-board-ing-house, and my b-b-boarders are the biggest e-eaters you ever s-s-saw. P-p-pick out n-n-nine of the t-t-toughest you've g-g-got."

The farmer complied, and laid aside the other three tender ones.

Platt picked them up carefully, and putting them in his basket, said, "I b-b-believe I'll t-t-take these three."

SAID a lady to her husband during the late panic, "I am not afraid but that we shall have enough to live on. I believe that we shall be provided for if we only trust in Providence."

To which the husband replied, "Well, you'll divide with the children, won't you? and I will look out for myself the best I can."

MR. DONN PIATT has this little squib at one of the most eminent of our public men. The question was asked, "Do you think that Charles Francis Adams will be a candidate for the Presidency?"

"I doubt it," was the reply. "Charles Francis is the sort of man who makes up a party in himself. If any other organization attempts to join him, he immediately secedes, under the impression that something must be wrong if he is not in a minority. He will not remain in a party long enough to see it die, and if he joins it after its death he can not keep up in the procession. He is like that fellow who hired a horse and bug-

gy at a livery-stable, and was requested, as usual, not to overdrive the animal. The man gravely turned in his seat as he gathered up the reins, and said, slowly and earnestly, "Stranger, I am going to a funeral, and I'm bound to keep up with the procession if it kills this hoss!"

THEY are dropping into poetry in Oregon, judging from the following superscription on a letter sent from Portland, in that far-off State:

To Harry Howard, sleek and comely,
Standing up behind his bar,
Take this letter, take it quickly:
'Tis not to go so very far;
Only to the rural village
In the valley by the mountains,
Where the trout play in the fountains,
Where builds her nest the pretty swallow,
And the pigs do Walla Walla.

WE all take things for granted. This was the case at a prayer-meeting in the northern part of Maine, when the pastor remarked that if any had relatives in distant lands, prayer would be offered in their behalf. Thereupon a man of the people arose and said, "I would like you to pray for my brother. He went away two weeks ago, and I haven't heard from him since. I don't know just where he is, but you needn't pray below Bangor."

A FRIEND in Maine sends the following:

Mr. Earle, a gentleman who has a wide reputation as a revivalist, made a recent visit to Waterville, where his labors were attended with success. When about to depart to keep an appointment at Gardiner he began an exhortation to some of the guests at the Williams House. Mr. S—, who had a carriage ready for his conveyance to the dépôt, reminded him it was time to leave.

"Oh no," said Mr. Earle; "the Lord controls the trains."

"Yes," replied his matter-of-fact friend, "but if you intend to go by this train you must start now, for to my certain knowledge the Lord has had nothing to do with the M. C. R. R. for upward of two years."

The minister got left.

WHERE else than in Pennsylvania could this have occurred?

A doctor of our village was recently taken off suddenly, which fact was announced to us by Jake A—, a boy living at our house, who at times would, in the most innocent way, describe things irregularly. Coming in hastily, and nearly out of breath, he exclaimed, "Oh! Dr. F— is dead; he's had a *political stroke*!"

Dr. H—, a well-known hygienic physician in —, not only attends to the bodily ailments of patients in his institution, but frequently takes occasion on the Lord's Day to administer to them a little spiritual medicine in the form of a lengthy extemporaneous sermon. Not long since, having called them together, he proceeded to talk, taking for his subject the Crucifixion. The discourse was a good one, and in the course of it he had so worked upon the sympathies of his auditors that many were in tears. After dwelling upon the cruelty of that mode of punishment, the doctor spoke of the malefactor crucified at

the Saviour's right hand, who was so blessed as to receive pardon. "Brothers and sisters," said he, "who among us would not give all he possesses to-day to be thus favored? I would give ten thousand worlds if I could have been there and been that thief. Yes," continued he, after a moment's pause, as if to reflect, "I would give eleven thousand!" The effect upon the audience of this additional *bid* may be imagined.

WE have from Colorado an account of one of those interesting incidents in Western life connected with that noble animal, the horse. It is thrown into epic shape and glides as follows:

A stranger from the mountains came slowly riding down,
And stopped to get his dinner in a Rio Grande town,
And his rough-haired, raw-boned, played-out, tired,
and hungry-looking steed
He sent out to the stable to recuperate with feed.

It wasn't such a fancy horse: his joints were very large,
And his legs hung out each side of him like oars upon a barge;
And the stranger who came riding that nag into Del Norte

Had no exalted opinion of his qualities, I thought.

But when they went to chaffing him—those sports across the range—

That he should get his dander up is nothing very strange.

And when they went to betting that they had a colt "right thar"

That could beat his "hoss," he bridled up with "Gentlemen, I'll swar,

"Although I don't much keer to run, I never let a banter

Bluff me while I have horseflesh that kin walk or run or canter;

So if you've got a runnin' hoss, or a dozen, trot 'em in,
And I'll try to make it lively, if nary a red I win."

Then like wild-fire spread the rumor throughout that mining town

That they'd caught a "greeny" nappin', and would do him up so brown

That 'twould make his head swim maybe, for they entertained no doubt

Of their open-and-shut ability to clean that stranger out.

From fifty-dollar greenbacks down to Sagusche County scrip,

They staked their money lively with a reckless "let 'er rip,"

For they "wanted ter wax that stranger on his hoss almighty bad,"

And they gathered up their bronchies and every nag they had.

Then straightway that stranger started with the citizens *en masse*,

To find a level spot of ground all covered o'er with grass,

For, said he, "I reckon we mout as well jes let the critters go

'Thout waitin' any longer, fer it muchly looks like snow."

The rivals in that scrub lit out; the stranger got the lead,

And the "ornery" horse developed extraordinary speed.

He got away right easy with those San Luis Valley nags,

And that stranger he stood treat at Storms' as he pocketed their rags.

A most excellent and instructive as well as very entertaining little volume is the Rev. Dr. Tyng's *Office and Duty of a Christian Pastor*—a course of five lectures delivered in 1873 to the students of the School of Theology in Boston University, and recently published by Harper and Brothers. After speaking of the *object* and *qualifications* of the Christian pastor in the ful-

fillment of his important office and work, he alludes to the *instruments* which he is to employ in addition; and in doing this he contrasts the success of the contented, cheerful-tempered man with the failure of the discontented, complaining man. Of the latter type the doctor says:

"What an unwholesome, repulsive miasma spreads around him! He can not be desired, nor longed for, nor tolerated but by those who are more truly the imitators of a mild and gentle Saviour than he. He may know all books and all languages; he may be, in his own estimation, 'wiser than Daniel,' and really 'prouder than Lucifer;' he may be an adept in all conversation and all culture; but none desire him, and every place in which his ministry is appointed and exercised becomes really more discontented than he.

"Such a man occurs to my mind. He was talented, educated, and outwardly well prepared. But he had no aptitude of personal conformity to appointed conditions, and he has rolled and tumbled through the Church from one inferior place to another still more so, until in age he seems likely to have no home open to him in any part of the Lord's work on earth. He asked me one day the reason for this. He said, 'I preach the same truth as you; why is my preaching useless?' We were near a butcher's stall, filled with a stock of most attractive meat. 'Why can not you eat that meat, so nicely cut up, and looking so clean?' I replied. 'Why, it is not cooked,' he said. 'That is exactly the point,' I answered: 'that which is wanting in all your work is cooking—adaptation to the wants and conditions of the people to whom you are sent. Your meat is nicely cut up and divided, but it is not cooked.'

"John Newton once went to hear a very critical and accurate preacher, and when asked by him how he liked his discriminating analysis, answered, 'One great distinction you seem to have forgotten—the difference between bones and meat.'

Another of the doctor:

"At twenty-one years of age and a few weeks over I left my New England home in the character of a preacher—the world before me, and Providence my guide. Four weeks afterward I found myself settled as a pastor in a church in Georgetown, in the District of Columbia, then the business suburb of the city of Washington. It was a church of which I had never heard, and in which not a single individual was known to me. They accidentally heard me without my knowledge. Their aged pastor left them but the Sunday previous, and pleasantly said to them, 'If that young man had an *h* in his name he would be the very *thing* for you.' They took me at his word, and thus made me the thing."

One more:

"My habit of preaching, which I had acquired in a revival at Bristol, Rhode Island, from whence I had gone within the previous month, was entirely extemporaneous, and was sometimes very trying. It was while in Georgetown I went as usual to my church one Sunday with my feeble preparation for the pulpit. It was during the session of Congress, and to my amazement a large number of public men were there, many of whom were personal friends of my father. I was terrified beyond control at the sight, and my gracious Lord left me to my own pride for my chasten-

ing. I forgot my text and my whole subject, and after blundering on for perhaps ten minutes in a most profuse perspiration, overwhelmed with confusion, I suddenly closed the service, and dismissed the congregation. Walking home, bowed down with my mortification, my wife, a daughter of Bishop Griswold, said to me: 'Now do give up this attempt at extempore preaching. You know my father said it would always be desultory and unconnected. You will never succeed in it, I fear.' I replied: 'I will never give it up. This very occasion has made me determined. It can be acquired, and, by the Lord's help, I will acquire it.' Thirty years after that I saw Mr. Van Buren—who was one of my distinguished hearers on that day—in St. George's Church in New York. He came up to the chancel to speak to me, with his friend Judge Vanderpoel, whom he was visiting. Referring to some things past, I said, 'Do you remember that day of my dreadful failure in preaching in Georgetown, in the beginning of my ministry?' 'Oh yes,' said he, 'but you have never failed since.'

THERE must be forms, especially in legal proceedings, otherwise where should we be? Every new form ought to combine what Lowell speaks of as

"Suthin' combinin' moril truth
With phrases such as strikes."

This seems to have been achieved on the following return on an execution issued in the case of the Singer Manufacturing Company v. James B. Bousely *et al.*, by the sheriff of Henry County, which will be appreciated by lawyers, and not a few ordinary people:

Came to hand December 16, 1873, at ten o'clock p.m., and afterward, to wit, on the 10th day of January, 1874, notwithstanding this writ has been 990 days from the date of issue, yet nevertheless be it remembered that on the above said 10th day of January, 1874, after many entreaties and a faithful presentation of "dead issues," I had the exquisite pleasure of manipulating the sum of one hundred and fourteen and 96-100 (\$14 96) dollars of the defendants' money, and for fear that some "salary grabber" would feloniously slich the same from my possession, I forthwith rushed frantically to the bank and deposited the same therein, and now, to wit, January 12, 1874, after two nights of sweet repose, I again rushed to the bank aforesaid and selected a draft from among the many, one in favor of William J. Wallace, Clerk of Marion County, Indiana, for the sum of one hundred and six and 41-100 (\$106 41) dollars for his careful manipulation and proper distribution. Said sum being sufficient to cause a bright smile to beam on the countenance of all herein concerned, except myself, for which I have amply provided by retaining the sum of eight 65-100 (\$8 65) dollars as my costs on collection and for serving summons in this cause. And the long lost is returned. For the long delay I require of Smith & Hawkins, attorneys.

H. L. McLEEN,
Sheriff Henry County.

THERE is nothing particularly amusing in the following, though at the time it was thought to have been an exceedingly ready and witty hit at an abuse. It is from the *Memoirs of Sir George Sinclair*, a work possessing no general interest for people in this country, and therefore not republished, and the extract is probably now for the first time in American type:

At the time the question of the wealth, and the abuses connected with it, of the Irish bishops, contrasted with the condition of the inferior clergy, was creating great interest in the public

mind, the dignitaries of the Church were boldly—certainly most imprudently—proclaiming themselves to be, and priding themselves on the assumed fact, successors of the Apostles. Sir George took them on their own terms, and in the most triumphant manner made themselves and their ecclesiastical pretensions alike ridiculous. After some preliminary observations Sir George thus proceeded:

If, during the laborious and successful excavations of enterprising Oriental explorers, a brazen tablet were dug up which, when deciphered and translated, and the sums represented by modern equivalents, proclaimed the following notabilia—

WEALTH OF THE APOSTLES.

Probate of their Wills.

Matthew	£400,000
Simon the Canaanite	150,000
Lebbaeus	100,000
James the Less	800,000
Paul	200,000
John	150,000
Peter	250,000
Andrew	150,000
Making a total of	£1,700,000

—If such a discovery of the wills of the Apostles were made, the obvious inference would generally be deduced that the public announcement of their having amassed such enormous amounts of "filthy lucre" must in no small degree have hardened their hearers against the more impressive exhortations to let their affections on things above, and not to lay up for themselves treasures upon earth. A similar result will, I doubt not, ensue whenever the subjoined short but significant paragraph is read by acute and impartial inquirers, in reference to certain dignitaries professing to be the rightful and indefeasible successors of the "twelve" whose disinterestedness and self-denial were as conspicuous as their sanctity and success:

WEALTH OF THE IRISH BISHOPS.

Probate of Irish Protestant Bishops' Wills.

Agar, Archbishop of Cashel	£400,000
Porter, Bishop of Clogher	250,000
Knox, Bishop of Killaloe	100,000
Stuart, Archbishop of Armagh	800,000
Hawkins, Bishop of Raphoe	250,000
Fowler, Archbishop of Dublin	150,000
Beresford, Archbishop of Tuam	250,000
Total	£1,700,000

In Nevada, even as in New York, the great business of courtship goes on as briskly as ever, though some of the details vary. From the former locality we are furnished with a narrative which has a slight dramatic action and flavor not common to Fifth Avenue. It is described thus: "My sister Em has got a feller who has been coming to see her 'most every night for some time. Night before last, just to have a little fun, I went in the parlor, and crawled under the sofa on the sly, and waited there till he and Em had got settled; and just as he was asking her if she was willing to be his dear partner for life, and trust to his strong right arm for protection and support, I gave three red-hot Indian war-whoops, and bumped myself up against the bottom of the sofa, and fired off an old horse-pistol that I had borrowed of Sam Johnson, and, my gracious! how that feller jumped up and scooted for the door! He never stopped to get his hat, but went tumbling head over heels down the door-steps. As for Em, she was just that scared that she squatted right down on the floor, and screeched like blue blazes, till dad and mother came running in, with nothing on but their night-clothes, and wanted to know what the matter was. But Em only yelled the louder,

and kept pointing under the sofa, till dad got down on his knees, and saw me there, and pulled me out by the hind-leg. When he had got me out in the wood-shed, he warped me over his knee, and then went at me with an old trunk strap, and I haven't got over it real nicely yet."

FROM Sunbury, Pennsylvania, comes this:

In February last the Rev. Mr. Jack, of Danville, Pennsylvania, went to Turbotville to assist at a protracted meeting, with the intention of returning the next day. While walking on the street with the resident minister, the latter prevailed on Mr. J. to remain until the day following. To relieve any apprehension on the part of his wife at his not returning at the appointed time, he immediately went to the telegraph office and sent the following telegram:

Mrs. A. B. Jack, Danville, Pennsylvania:
Psalm v. 3, first clause in the verse.

A. B. JACK.

Which, being interpreted, saith, "My voice shalt thou hear in the morning."

DIALOGUE in a cemetery:

WIFE. "Ah, husband, do you see this beautiful carving?—how delicately cut in the pure white stone!"

HUSBAND. "Yes, very pretty."

WIFE. "But, William, you have no taste for art; you don't enjoy these things as I do. Just notice this slender column of immaculate marble, with the touching question so beautifully carved, 'Do they miss me at home?'"

HUSBAND. "Yes, I see; and here is her name on the foot-stone—'G. A. B.' Yes, I guess they miss her, if that was her name."

And there came silence.

WHILE Company "N" of the Twenty-eighth Pennsylvania Volunteers was doing picket duty on the Potomac, John Moy, not many years from old Ireland, was placed as sentinel, with orders to examine all "passes." During the day a horseman chanced that way, and being summoned to halt, handed his pass to Moy, who leisurely scanned it, gave it back, and permitted the horseman to go on. Moy's deliberation had been noted by Lieutenant P—, who called out,

"Was that a proper pass?"

"Yis, Sur."

"What was on it, John?"

"Divil a bit do I know, Sur, but with all the readin' and writin' there was on that pass, it was enough to pass a major-gineral to the very divil!"

ONE of the most estimable men in Albany—a printer, of course—sends to the Drawer the following: Our proof boy is reported as having gone to the Medical College in this city with a proof. By mistake in entering he opened the door of the museum, and in passing through stopped in front of a case in which a skeleton was hanging. As he stepped up to examine, the floor yielded a little, and the wire attachment to the floor caused the skeleton to raise its arm. The boy was frightened and ran. On reaching the street the student who wanted the proof hailed him to come back.

"No, you don't!" exclaimed the lad. "Think I don't know you now, since you got your clothes on!"

PAT'S PHILOSOPHY.

OUR readers have doubtless always understood that R. H. Stoddard, who gives us a bit of poetry now and then, is an American of Anglo-Saxon descent. But this is a mistake. The following specimens establish beyond a question his Celtic origin:

PAT'S PHILOSOPHY.

When the winter is cold
I keep meself warm;
When the summer is hot
I keep meself cool:
It's mebbe I'm bold,
And it's mebbe I'm not;
But a gossoon's a fool
When he goes into harm!
Ses my old Uncle Dan—
A wise one, and stiddy—
"What's the world to a man
When his wife is a widdy?"

When the soldier struts by
With his sword at his side,
And the rattle, rattle drums
Beat the roll and the call,
He may go or may fly—
I stay here till death comes,
For I mind me of all
That in battle have died!
I am like Uncle Dan,
For he said—troth and did he—
"What's the world to a man
When his wife is a widdy?"

When the sailor hoists sail,
And stands out on the deep,
Laving sweetheart or wife
And the childer behind,
He timpts the wild gale,
And he trifles with life,
And he sinks, d'ye mind,
Where the mermaidens sleep!

"Pat," sez old Uncle Dan,
"Stay at home with your Biddy;
What's the world to a man
When his wife is a widdy?"

Let the scholar sit up
And write late and long,
To insure him a name—
He may sit up for me;
Give me but a full cup,
He may have all his Fame;
For it's stuff, d'ye see,
And not worth an old song!
Let us live, Uncle Dan;
Let us live and love, Biddy;
What's the world to a man
When his wife is a widdy?

BIDDY'S PHILOSOPHY.

What would I do if you was dead?
And when do you think of dying?
I'd stand by your bed, and hold your head,
And cry, or pretend to be crying!
There's many a worser man nor you—
If one knew where to find him—
And mebbe many a better, too,
With money to leave behind him!
But you, if I was dying to-day
(I saw you now when you kissed her),
I tell you, Pat, what you'd be at—
You'd marry your widdy's sister!

You'd make an iligant corpse, indade,
Sleeping so sound and stiddy:
If you could see yourself as you laid,
You'd want to come back to Biddy!
You would be dressed in your Sunday best,
As tidy as I could make you,
With a sprig of something on your breast—
And the boys would come to wake you!
But you, if I was dead in your stead
(Do you think I never missed her?),

I tell you, Pat, what you'd be at—
You'd marry your widdy's sister!

The undertaker would drive the hearse
That has the big black feather:
If there was no money left in your purse,
Your friends would club together!
They'd look at your cold remains before
They followed you down to the ferry;
And the coaches standing at the door
Would go to the cemetery!
But you, if I was once in the box
(I wonder her lips don't blister),
I tell you, Pat, what you'd be at—
You'd marry your widdy's sister!

When you was under the sod I'd sigh,
And—if I could do without you,
Mebbe I've a strapping lad in my eye
Would come here and talk about you!
A little courtin' would be divertin',
A kind voice whispering, "*Biddy!*"
And a kiss on the sly—for what's the hurt in
A man consoling a widdy?
But you, before I was dead at all
(Now don't deny that you kissed her),
I tell you, Pat, what you'd be at—
You'd marry your widdy's sister!

HERE is a sermon on a dead chicken by our little friend Ethel, a six-year-old:

"Like in the fable of the man, the boy, and the donkey, I can not hope to please every one, but I will try to do my best with this sermon. The heart has its little vanities and its little goodnesses. Do not laugh at man's poorness, my dear friends. I hope you will regard this solemn service with great solemnity. This dear one has departed the lower world. Mourners, cry not; mourn not, for the departed one has gone to a place so sweet in eternity. It is well for it that it has died early, for it is saved much pain. We must not blame the dear mother. In her energies to procure food, the mother had kicked over the dish on one of her little ones, and this—the result. We warn all these listeners that when they have life, energy, thought, soul, they should prepare themselves for death, for man knoweth not the hour nor the day of judgment. This little one slumbers sweetly in her coffin. She is happy; she is an angel now. It is only her body will sleep in the grave; her spirit has gone to the *animality* kingdom. She misses not her Indian meal, she misses not her mother. This little one has been taken in the prime of her life. (I warn thee to be attentive, and not trim thine hat with dock leaves and flowers from the decorations of the body while I speak to thee.) I speak to thee not harshly, and give thee the advice I gave before. Be ready, prepared for slumber, peace, happiness, righteousness. I will now relate a fable, which has a parable. There was once a hog who was dirty, and lived in a sty. He loved filth, and was greedy and unrighteous. There lived on the same farm a lamb, who was clean and tidy, and ate fresh grass, and was innocent. One day the lamb addressed the hog, and said: 'Sir, if your habits were better, and you were cleaner, and ate meal, or grass and hay, as I do, people would relish you better. I do not consider myself better than other people, but I am only advising you how you might amend some of your habits.' But the hog answered, in a surly tone: 'Humph! heh! heh! To you it is easy; but I am accustomed to this. I am a hog, and you a lamb.' But the lamb asked, mildly, 'Have you ever experienced what it is to be good?' 'No; and I don't wish to, either;

I don't care much about it.' Wickedness is the filth the hog longs after. The lamb is the good angel who tries to coax people to do better. Now, my friends, it is time for the removal of the coffin. (And now, Ocey, you must throw up your arms and begin to howl.)"

This comes from a correspondent in Sedalia, Missouri. During the late war, while the Federal troops near here were taking a good many prisoners, a prominent Southern divine found himself in quandary. Calling on the general commanding, he said:

"Sir, I have been ordered by my bishop to pray for the President of the Confederate States. The United States forces now having possession of the place, I don't know what to do, and in my difficulty I come to you."

The general, a kindly man, asked, "How long have you prayed for Mr. Davis?"

"Ever since the war began."

"Well, my dear doctor," continued the general, "I am not much of a theologian—only a poor soldier who obeys orders; and as your prayers don't appear to have done Mr. Davis much good, or us any harm, I see no objection to your obeying your orders, and continuing your supplications for Jeff, who certainly needs all the help, spiritual and material, he can get."

The doctor, as they say in Georgia, "resumed the primeval condition of his former rectitude."

THE MAIDEN'S LAST FAREWELL

IN THE DAY OF CREMATION.

THEN the night wore on, and we knew the worst,
That the end of it all was nigh:
Three doctors they had from the very first—
And what could one do but die?

"Oh, William!" she cried, "strew no blossoms of
spring,
For the new 'apparatus' might rust;
But say that a handful of shavings you'll bring,
And linger to see me combust."

"Oh, promise me, love, by the fire-hole you'll watch,
And when mourners and stokers convene,
You will see that they light me some solemn, slow
match,
And warn them against kerosene."

"It would cheer me to know, ere these rude breezes
waft
My essences far to the pole,
That one whom I love will look to the draught,
And have a fond eye on the coal."

"Then promise me, love"—and her voice fainter
grew—
"While this body of mine calcifies,
You will stand just as near as you can to the flue,
And gaze while my gases arise."

"For Thompson—Sir Henry—has found out a way
(Of his 'process' you've surely heard tell),
And you burn like a parlor-match gently away,
Nor even offend by a smell."

"So none of the dainty need sniff in disdain
When my carbon floats up to the sky;
And I'm sure, love, that you will never complain,
Though an ash should blow into your eye."

"Now promise me, love"—and she murmured low—
"When the calcification is o'er,
You will sit by my grave in the twilight glow—
I mean by my furnace door:"

"Yes, promise me, love, while the seasons revolve
On their noiseless axles, the years,
You will visit the kiln where you saw me 'resolve,'
And leach my pale ashes with tears."

LEFT ASHORE.

“AND THREE LITTLE HAPPY FACES SPED
TO THE DANCING BOAT—AND HE WENT TOO.”

SOFTLY it stole up out of the sea,
The day that brought my dole to me;
Slowly into the star-sown gray,
Dim and dappled, it soared away.
Who would have dreamed such tender light
Was brimming over with bale and blight?
Who would have dreamed that fitful breeze
Fanned from the tumult of tossing seas?
Oh, softly and slowly stole up from the sea
The day that brought my dole to me!

Glad was I at the open door
While my footfall lingered along the floor,
For three bright heads at that dawn of day
Close on the self-same pillow lay;
Three sweet mouths I bent and kissed
As the gold and rose and amethyst
Of the eastern sky was round us shed;
And three little happy faces sped
To the dancing boat—and he went too—
And lightly the wind that morning blew.

Many a time had one and all
Gone out before to the deep-sea haul;
Many a time come rowing back
Against the tide of the Merrimac,

Entered according to Act of Congress, in the year 1874, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.

VOL. XLIX.—No. 290.—11

"AND THOUGH EVERY POOL WHERE THE FULL TIDES TOSS
I SEARCH FOR SOME LOOK OF CURLING FLOSS—"

With shining freight, and a reddening sail
Flapping loose in the idle gale,
While over them faded the evening glow,
With stars above and with stars below,
Trolling and laughing, a welcome din,
To me and the warm shore making in.

Then why that day, as I watched the boat,
Did I remember the midnight rote
That rolled a signal across my sleep
Of the storm that cried from deep to deep,
Plunging along in its eager haste
Across the desert and desolate waste,
Far off through the heart of the gray mid-seas,
To rob me forever of all my ease?
Oh, I know not: I only know
That sound was the warning of my woe.

For lo, as I looked, I saw the mist
Over the channel curl and twist,
And blot the breaker out of sight
Where its angry horn gored the waters white.
Only a sea-turn, I heard them say,
That the climbing sun will burn away.
But I saw it silently settling down
Like an ashen pall upon the town:
Oh, hush, I cried; 'tis some huge storm's rack;
My darlings, my darlings, will never come back!

All day I stood on the old sea-wall,
Watching the great swell rise and fall,

And the spume and spray drove far and thin,
But never a sail came staggering in.
And out of the east a wet wind blew,
And over my head the foam-flakes flew;
Down came the night without a star,
Loud was the cry of the raging bar;
And I wrung my hands and called and prayed,
And the black wild east all answer made.

Oh, long ere the cruel night was done
Came the muffled toll of the minute-gun;
Nothing it meant to me, I knew,
Save that other women were waiting too—
For many the craft that, cast away,
On the shoals of the long Plumb Island lay,
Wrecked and naked, a hungry horde
Of fierce white surges leaping aboard,
And bale and bundle came up from the sea—
But nothing ever came back to me.

And though every pool where the full tides toss
I search for some lock of curling floss,
Yet still in my window night by night
The little candle is burning bright—
For, oh, if I suddenly turned to meet
My darlings coming with flying feet,
While I in the place they left me sat,
No greater marvel 'twould be than that
When so softly, so sweetly, stole up from the sea
The day that brought my dole to me!

"YET STILL IN MY WINDOW NIGHT BY NIGHT
THE LITTLE CANDLE IS BURNING BRIGHT."

THE MOUNTAINS.—IX.

ILLUSTRATED BY PORTE CRAYON.

THE HIGH WAYS.

"THE American is the hero of the world. Among civilized men he is ever readiest to forsake the ease and comfort of an established home, to spurn the pleasures and allurements of a luxurious society, to turn his back on the peace and protection of an enlightened State, and devote himself by deliberate preference to a life of rudest hardship, privation, and danger. Whether the motive be worthy or despicable; whether the object be small or great; whether to gratify a longing for rash and aimless adventure or ignoble greed for sudden riches; whether to carry the seed of civilization into the wilderness or reclaim a continent from barbarism—his courage and self-abnegation are equally admirable. Abandoning the savory flesh-pots of the East without a regret, he endures malaria, swindlings, and disappointments with the exalted stolidity of an Indian fakir, and resigns himself to a diet of fried meat, saleratus bread, and pine-tar whisky with the smiling fortitude of a Christian martyr."

"True," said the major, with animation; "and does not the wild campaigner, this bold pioneer of the army of progress, get more real enjoyment out of life than the sneaking bummer who lies malingering in camp or hangs on the skirts of the battle, waiting to profit by the victory without sharing the dangers of the combat? Better wear out early than to rust and linger."

While the journey from White's had dulled the wire edge of our rough-riding fancies, the trip up the Blackwater had quite satis-

fied us with mountaineering; not surfeited exactly, but experiencing such healthy satisfaction as that philosophic Sambo who beat his own shins until the tears rolled down his cheeks, "'cause it felt so good when it was done hurtin'."

Cockney, who for a week past had endured life in silent agony, was now half wild with reactionary exaltation, declaring he was ready for any thing, and wouldn't swap his recent experiences for a block on Broadway.

Rattlebrain, albeit somewhat toned down by his late shadowy misadventures, felt sufficiently revived to rate his enjoyment at the usual modest figure of a hundred thousand, cash.

Major Martial's extended experiences induced a more reasonable estimate of the ups and downs of our romantic journey, and I shrewdly guessed that now, like a skillful soldier, he was thinking more of the "enemy" in front than the character of our recent camping grounds.

Sympathizing to the full with my companions in their pride of achievement, my triumph was yet clouded by a half-acknowledged consciousness that, in spite of cheeks bronzed and ruddy with health, of muscles tough as whitleather, and omnivorous appetite, I had gained no corresponding advantages over certain intellectual and sentimental maladies which I had been especially solicitous to cure.

But, after all my efforts, it was now as ever—realities faded into dreams, while dreams were my realities. The long vista of stony startling facts had but lightly tinted the tablets of memory, while sharply and definitely graven thereon stood forth a catalogue of trifles scarcely worth the naming—the wilding beauty of a way-side flower, the working of a pretty thought or suggestion of a graceful sentiment, the changing colors of a morning cloud or the more evanescent glories of a woman's smile, to be cherished, perhaps, when fatigues and dangers, rocks and mountains, have sunk behind the dim horizon of time.

A strong man's will is like a dike raised against the sea of his nature. By eternal vigilance, strengthening and repairing, he may succeed in protecting his quiet domicile and smiling gardens behind, but he

must neither sleep nor indulge in the luxury of dreams, for the sea is always there, deep and menacing. Oily calm, its insidious waters are ever undermining; tempest-tossed, its abrading waves overwhelm his work with swifter destruction. Even while rejoicing in my triumph over difficulties, dangers, and dyspepsia, I felt the deep sea rolling over my hopeless soul. I was passionately in love.

The highway was plain and practicable, the country through which we passed without especial interest; so, giving our horses head, we rode for the most part in silence, stopping occasionally to question some rabbit-mouthed forester concerning directions and distances, or to dip a cup of water from some tempting stream that sparkled across our route. But still there was no attempt at sustained conversation, and we continued to ride apart, each apparently absorbed in his own meditations.

During these hours I had arraigned my own deceitful, treacherous heart before the high tribunal of reason, obtained its full and frank confession, weighed and accepted its plea of justification, and accorded grace to the bounding culprit. When my own case was settled I felt more lightsome and sociable, and moved by a friendly curiosity to understand the current of my companions' thoughts, spurred up my lagging steed and joined Cockney, who was just ahead of me.

He looked up dreamily. "Mr. Laureate, that South Branch country would be a glorious place to live in, wouldn't it?"

"That it would," I answered, cheerily, "with a few hundred acres of bottom land and a buxom wife—"

He interrupted me hastily. "Oh, I wasn't thinking of that, I assure you. I—I—" And the young gentleman blushed and stammered so painfully that for charity's sake I rode on, and the next moment found myself involuntarily overlooking a volume of Dick Rattlebrain's reminiscences, in the shape of a tuck memorandum-book containing several locks of hair, dried geranium leaves, and a dozen or more photographic portraits.

Without affecting any secrecy, Dick passed his collection for my inspection, requesting me not to drop any of his mementoes, at the same time heaving a few sighs, which resembled the efforts of a pump with a dried sucker.

The locks varied in hue from flaxen to raven—one, I am sure, was of jute—and the simpering faces that were pasted on the leaves of his book might have been plundered from any village photographer's showcase. One picture, lying loose and somewhat torn and crumpled, I recognized as Miss Primrose.

"Ah!" said I, smiling. "Did she give you that, Dick?"

Richard made an affected and futile snatch at the portrait, as if he would have concealed it, and then replied: "Well, no, not exactly; but, to tell the truth, that was the cause of our quarrel up there, you know. But you, Mr. Laureate, are so high-flung, I dare say you wouldn't think it honorable to tell about one's love matters."

"That depends on circumstances, my dear fellow."

"Well, to be sure it does; but I observe you are very careful never to name your sweetheart even among your confidential friends and companions." And with that he ostentatiously wiped his impertinent eyes with the lace handkerchief he had picked up at the tunnel.

I hastily handed back his leathern casket, and choking off an attempted repartee, dashed forward to join the major. Dick called after me in a stage whisper, "Come back, Mr. Laureate, come back and acknowledge the corn! Name her name, and I'll give you the handkerchief. 'Pon honor, you shall have it!"

The bait was indeed tempting, but I revolted at the idea of trusting my heart's secret to the indiscreet puppy; so ignoring his offer, I drew rein beside the major.

Engaged in a contest with a native cigar obtained at Horseshoe Bend, the veteran's physiognomy was so flushed and puckered that one scarcely expected there could be any spooney sentimentality under such a mask; yet when, with a little snappish oath, he presently threw away the cause of his momentary vexation, his face unraveled into a smile of unusual benignity.

"We've had a charming trip, have we not, Laureate?"

I was enthusiastic. "It was more than charming—an era in one's life, invigorating both to mind and muscle."

"Delightful!" exclaimed he. "Your enthusiasm gives us a hope of immortality in a green-backed, gilt-edged epic, at least."

"Quite the contrary," I replied, not altogether relishing his taste in dressing the Muse. "I never felt less poetical or more gloriously animal than at present. Verses are the expression of sickly sentiments and secluded humors, while I—while I am tingling with life and health."

With a wink of penetrating slyness, the major added, "And consequently can find no inspiration in the witchery of dark eyes and glowing cheeks."

I said, "Under certain circumstances. There is Martha White or Dilly Wyatt, either of whom might inspire a page or two of rhyming sentiment; but, after all, I am not such a tinder-box as our friend Dick, who instantaneously ignites under any bright eye that happens to focus on him."

"Ah, Laureate," quoth the major, with a long-drawn sigh, "you pretend to laugh at

THE BUY WAYS.

your gift. I wish it were mine. 'The pen is mightier than the sword.'

"True," bawled Dick from behind; "and a smart widow carries them both in her reticule."

In his fury the veteran bit sheer through his second cigar, and cast the fragments into the road. Vexed at the rudeness of the graceless whelp, I nevertheless felt grateful for the interruption of a tête-à-tête which was becoming rather embarrassing. I had lately suspected the major of a design to make me his confidant in a certain matter—a sharp manœuvre by which he might effectually "spike my guns," or unmask a rivalry which he evidently apprehended. I was more than ever solicitous to avoid such a dilemma, so I held our company together, and endeavored to "switch off" conversation on another track. But the magnetic current was controlling, and although debarred from the special subject, our social leader opened a general discourse on the tendencies of modern society.

"A man's true career is amidst the dust and turmoil of life's highways."

"And I'll warrant, major, you have kicked up a considerable dust yourself in those same highways."

Disdaining the interruption, the veteran continued,

"But woman, God bless her! most naturally and gracefully seeks the by-ways."

"That she does," reiterated Dick; "and don't she make the dust fly, too?"

"Young man," growled the soldier, "this is insufferable. I shall make a personal matter of it if you don't abstain."

"I am very sorry, major," quoth Rattle-

brain, with affected meekness, "but I thought I was helping you on with your speech."

The philosopher succeeded in curbing his own temper by tugging at his horse's bridle, which so chafed the spirited brute that he dashed off, bearing his master beyond the reach of present annoyance.

"The old humbug!" quoth Dick, looking after him. "He has been trying his best to bribe or cajole me out of this handkerchief, and to keep 'mum' about my having found it, but he couldn't raise the thousands to buy it. Not for Joe!"

My cheek burned as I put the question, but I could not forbear asking Rattlebrain why he prized this special bit of lace and cambric so extravagantly—he, the possessor of trophies enough to adorn

the belt of an Apache chief.

"I value it," said Dick, with a roguish leer, "because it belongs to the handsomest and smartest woman in Virginia." Then sidling up, he continued, in a confidential tone, "And because I am sure the lady would prefer to have it in your keeping." So saying, he slipped the precious trinket into my hand. My brain reeled with the wine of sudden joy as I heard the words and clasped the treasure. Then with the ebbing tide of feeling came a suggestion of prudential pride—I must not suffer myself to be thus bribed into confidential relations with so indiscreet and unreliable a friend. I stammered, and hesitated.

"Keep it, Larry. Don't make a Judy of yourself, and let that old padded-up major cut you out. Don't you think I understand and appreciate the sacrifice you made in waiting for me at the tunnel?"

"It is very kind in you to recall that, Dick." And I felt like embracing the amiable scape-grace on the spot, nevertheless contented myself with a less demonstrative grasp of the hand, then hid away my prize to dream on at leisure, and continued to discourse of fishing, hunting, and mountaineering as amusements worthy of the gods.

At the end of twenty-three miles we reached the Winston Tavern, on the Winchester and Parkersburg turnpike, and although it was only an hour past mid-day, we concluded to lay by and rest until the following morning.

During the afternoon our company was swelled by the addition of sundry teamsters and drovers, habitués of the road, and several mountaineers who straggled in to pick

up items of information from the great world outside, to chaffer about cattle, and incidentally to mix a little narcotic stimulant with their news as a digester. Among these we remarked a tall, athletic, black-bearded fellow, whose eye twinkled with a certain savage facetiousness, and whose swaggering sociability shamed all ceremony. Approaching our party, he saluted with the grace of a man who has had a bear for his dancing-master, and opened conversation in the lingo of the mountains, mixed, jumbled, and inflated with words and phrases which indicated some remote acquaintance with books or educated society. Seeing that we were disposed to be amused with his eccentric guest, the landlord joined us, and suggested that Mr. Rowzey should entertain us with his great bear story.

"Well, now, Best, you know I've fit and killed so many bar in my time that your request appears ondefinite."

Mr. Best particularized, "Of that bout you had with the bears who stole your honey."

"Now, Best," quoth Rowzey, in a deprecating tone, "I wouldn't mind a-tellin' of that story to you or any of these mountain men about here, bekase you know hit's every word the truth; but these gentlemen are entire strangers to me, as most likely they are to bar-huntin', and they mought think some pints of that story rather strong for their civilized stomachs, and I bein' a person notorious for my character and judicious of my integrity, and respectably connected down in the old State, I shouldn't risk to have my word misdoubted, 'specially among gentlemen sich as these appears to be."

The major here assured the speaker that we were ready to pledge ourselves in advance to believe every word he said, and as the weather was sultry, he requested Mr. Best to serve a large pitcher of mint-julep.

"Them remarks," said Rowzey, "shows

ROWZEY.

DISAGREEMENT.

that you understand business, and are jist the gentlemen I took you for."

After a preliminary drink and some wordy compliments to the liquor, the historian seated himself and began his story:

"A bar is looked upon by the onexperienced as a mighty turrible beast; and so he is, 'specially if he happens to be an old she. The bar is also a mazin cute cetur, and can tell by a man's countenance whether he's good to eat or not. Now as for you, Sir"—touching his hat to the major—"a sensible bar would most likely walk around you and trot off; but this here feller"—laying his hand on Cockney's shoulder—"he'd make a comfortable meal of at first sight."

The audience laughed, and Rowzey took another drink.

"A bar," he continued, "is an animal to be respected and imitated. He seldom goes out of his way to injure any body, but he don't stand much foolin' if any body undertakes to meddle with him. He remembers a good turn longer than most men do, and if he has a weakness for honey, I've never knowed him, of his own accord, to mix it with any thing deleterious. So much for the principal character in my story, and I must follow with a short sketch of myself before I come to the main pint. Not far from where I was borned there lived an old woman that was believed to be a witch. Now whenever a baby was borned she could tell at first sight what he or she was likely to be good for in the world. When she see

my oldest brother lookin' so cute out of his eyes, and holdin' his little fists so tight, she condemned him to be a lawyer. And so it was. He turned out to be one of the biggest rascals in Southwestern Virginia. The second boy my mother fetched was prophesied for a famous politician, and he growed up still worse than the lawyer, if so be sich a thing is possible. Now when the old woman was called on to look at me, she sot for a long time in a kind of a brown-study. At last she spoke up. 'This boy,' says she, 'has got the gifts that might set him ahead of either of his brothers, but it would be a shame to bring up sich a stout and open-handed baby to any of them weakly, sneakin' businesses.'

"Daddy took the thing to heart, and bein' flattered with her prognostications concernin' of me, concluded to do full justice to my faculties and bring me up as a bar-hunter; and so he christened me Rowzey, after old Leather Bill Atkins's big bar dog. This dog aforesaid was so turrible on wild varmints that Brother Ballard, the lawyer (who was high larnt), told Leather Bill if he wasn't stopped there would be no game left in the mountains—no more than there was in the island of Chios after Orion's raid. Not bein' much addicted to Scripture, I don't know what that meant. No more did old Leather; but the expression skeered him, and he sent the dog away.

"Well, no sooner was I fairly weaned than daddy begins my eddication by gittin' me a six-months-old bar cub for a playmate. That

cub we named Rough, accordin' to his nater, and he was a very comfortable friend as long as we were rompin' or sleepin' together; but when our bowl of mush-and-milk was sot down there was a suspension of sociabilities until one of us got a sound wallop in', and the winner finished the mush-and-milk.

"Rough and me generally fit fair, but he would sometimes take a mean advantage when he found I had the upper hand in a fight; he upstot the pan, well aware that when it came to lapping milk off the floor he was boss and I nowhere. In spite of these little onpleasantnesses we both managed to keep fat and hearty, and no outside beast or human ever undertook to poke his snout between us without feelin' the strength of our friendship. When we had growed to be three or four years old, Rough, accordin' to bar nater, had got so far ahead of me, and so careless about my clothes, that mammy begin to feed us in separate pans. This new plan was so mighty quiet that mammy, fearing we might pine for our usual exercise and excitement, would sometimes slop a bowl of milk into the mush pot, and allow us to go for the scrapin's. Gentlemen, are you acquainted with scrapin's?"

We were constrained to acknowledge our ignorance of the term. With a smile of benignant pity for our simplicity, the narrator proceeded:

"In our settlement it was the pride of good housekeepin' to keep the mush-pot always hot and never empty, and what with

fillin' and refillin' you might reckon it would git pretty well gummed up. It was cooled off and scraped mostly of a Saturday evenin'. Now, gentlemen, them scrapin's, all so crisp and crusty, had a flavor that was mighty enticin' to boys and bars, and I can't help feelin' sorry for a feller whose boyhood hain't been enriched with the recollection thereof. But to foller the text. Although it mought be supposed human wit would have given me some advantage over a brute beast, yet, to tell the truth, Rough's muscle was gittin' a little too much for my strength and science together, as appeared one day when a whole coach-load of our lawyer and politician relatives come to make a sociable visit to daddy and mammy. I believe the whole notion of it was to befool him and her into signin' some paper, that they mought cheat him outen his land. But the bar and me knowed nothin' of that, bein' sent together into the kitchen when the company landed, mammy bein' ashamed to show us with the pretty children all dressed in store clothes and ribbons. But this put Rough and me both in a bad humor; so we fell a-quarrelin' between ourselves, and presently we had a row, and he slapped me into the slop-tub head-foremost, where I mought have drowned if, at the same time, he hadn't upstot the tub in his awkwardness. Now our visitors had jist laid off their cloaks and bonnets, and was a-slickin' up their children's curls, and a-braggin' of their smartness, when in I straddled, drippin' out of the slops, and bawlin'

SCRAPIN'S.

MAMMY.

like a bull-calf. Now mammy was one of those hard-headed women that set no value on calico and store knickknacks for herself, but to see her brag child cuttin' sich a figure in company was a little too much, and she flared up like an armful of brush.

"'Husband,' said she, 'either that boy or that bar has got to leave this house. The brute has outgrowned the child, it has, and they can't git along agreeable no more, and on account of its onmannerliness it's onpossible to keep Rowzey dressed decent, it is.'

"'Well, what's to be done about the boy's eddication?' says dad.

"Mammy suggested that I was gittin' big enough to go to school. Dad had hearn say it was more aristocratic and safer for the children's morals to have a private tutor, so he swore we should hold on to the bar.

"Things went on as usual for a while, when the family dispute was settled by a onforeseen circumstance. One day I was roastin' of a tater in the ashes, when I observed Rough a-settin' off by the door a-watchin' me out of the corner of his eye. I mistrusted his intentions, and as I knowed I was no longer a match for him in a scramble, I jist kivered my tater a little deeper, and slyly put the poker to heat in the coals. When it was done, I took up the poker and poked out my tater on the hearth. No sooner was it clear of the hot ashes than Rough's paw covered it, and slap went the red poker atop of his paw. There was a yell you mought have heard a mile off, and the whole cabin smelt of burnt har. I was scared myself; so, droppin' the poker and hustlin' up my roast, I started for the stable loft, but at the room-door I met daddy comin' in all in a flare.

"'Rowzey,' said he, 'what have you been a-doin' to that poor brute beast?'

"'Nothin',' says I, feelin' mighty mean. 'He grabbed my tater, and I licked him, that's all. And it was a fair fight.'

"But what do you think the cussed brute

done? Why, he jist held up his burnt paw to show daddy, and then went nosin' and whinin' around the hot poker, tellin' the whole story in fewer words than any human could have done. Well, dad jist divided his judgments by givin' Rough the tater and givin' me fits, which was sweetened by my seein' the brute eat it, all the while makin' impudent faces at me, while I stood snivelin' in a corner. We never had any more friendship or confidence in each other after that. All the artfulness of my nater was roused by the wish to git square with the brute unbeknowns to daddy; and Rough never see me pick up any thing after that, even a chip, that he didn't run and hide himself.

"Mammy took advantage of the coolness, and poor Rough, like Ishmael, was sent back into the wilderness. After he was gone it come back to me that I had acted a mighty mean part toward my old companion, and for many a day I felt lonesome and pinin' whenever I thought of him. Then I was sent to school a while, where I was licked through from a b ab to Constantinople in less than two years, fit the boys, kissed the girls, and picked up an amount of book larnin' and high dic. that has been an advantage to me ever since, as you gentlemen can plainly see. But as soon as I had growed big enough to handle a rifle dad took me home agin, to shine up my professional eddication under hisself. Touchin' lightly on the vulgar business of plowin' and plantin' corn, he larnt me to track a deer and line a wild bee to sich a certainty that we never was scarce of meat nor honey in our house, though we did sometimes have to trade for corn meal. One evenin', as I was a-comin' home from watchin' a deer lick, I meets a bar right in the path. I was so took by surprise that I fired my gun in the air, then quickly dropped it, and drewed my butcher knife; but the varmint wasn't so much scared, and sot up on his hind-legs, shadin' his eyes with his paw, as if he was tryin' to make out who I was. That paw I noticed had a streak of white har across it, and the

DADDY.

next minute we was hugged in each other's arms; for you may well believe old Rough and me was mighty pleased to see each other.

"Now, gentlemen, a dog can always express his feelin's, or git our good-will, by a 'movin' tail,' but a bar is not likewise gifted, bein' limited to wry faces and awkward paws, and to have seen old Rough tryin' to say his say would have made you bust a-laughin'; but, gentlemen, it was plain to see the cretur's heart was in the right place. He bore me no grudge for the past, and tried to hide that scarified paw for fear I mought feel bad about it. Seein' that my old friend wasn't nigh so sleek and glossy as he used to be, I conceited he was leadin' a tolerable hard life, and tried to persuade him to foller me home, explainin' to him that we wasted enough at the cabin to keep him fat to the eend of his days. But no; his mind was fixed; his only answer was a mournful shake of the head, and givin' me a far'well squeeze, he trotted away into the woods. As he went, I thought I see him lift his paw to wipe a fallin' tear. You may laugh, gentlemen, but there is more humanity about dumb creturs than we are awar' of mostly.

"For a long time after that I was afeard to risk a shot at a bar, and to shun temptation, give up carryin' a gun, and turned my attention chiefly to huntin' bee trees. They were plenty enough in our mountains, and for convenience I built me a camp some way off from the settlements, and hewed out a

big trough to hold the honey I gathered. Now I filled my trough from time to time, but every night the varmints come and cleaned me out, which I knowed to be bars, seein' their tracks, and bein' awar' of their likin's. After losin' my labor in this way for some time, I bethinks me of a plan for gittin' even with 'em. I gits me a keg of peach brandy, and savin' a very moderate supply for my own needcessities, I pours the liquor into my trough, and mixed it pretty thick with honey. Then I whetted my knife, and retired to the camp to watch the effect of my trap. I carried a gourd full of the mix with me, which was so cussed sweet that I can't mind any thing more that happened until to-morrow mornin', when I was wakened by a hellaballoo the like of which I never heard before nor since. Clearin' the husks out of my throat with a swig from my jug, I draws my knife, and creeps on all fours toward the honey trough, where I see a sight which filled me with astonishment and laughter. The whole place was black with bars. I wouldn't like to risk my reputation—which is ondoubted—by statin' the number. There mought have been a hundred, more or less, of all ages and sizes, from an old six-hundred-pounder to a six-months cub, all drunk as Christians. Now the longer I studied their doin's the more nateral they looked, jist as I've seed civilized humans carryin' on up at Beverly after an election-day. Sich was the elevatin' influences of good liquor on savage brutes, which

JOLLIFICATION.

PATENT BALANCE.

appeared to raise 'em so nigh to our level, that as I laid there watchin' for a chance to go in I begin to feel as if I was plottin' murder agin my fellow-creturs.

"Howsomdever, what I mought have concluded don't much signify, for presently an old sot, happenin' to stagger into the thicket where I was hid, caught sight of me, and give a yell that fairly lifted the hat off my head, and fetched every bar to his feet. Apparently my time was short; but still calculatin' to stampede 'em, I up with a mighty shout, slitherin' the old blatherskite that raised the alarm. I went in through the brush like a whirlwind. It was a foolish idee. Peach-and-honey don't make brutes skeery no more than it does men, and in less than two minutes I was smotherin' under a squirmen' stack of bar meat about the size of dad's cabin. Now, as I wasn't smashed to death, my position mought be rightly considered providential, for the bodies of the brutes that lay next to me kivered me agin the teeth and claws of the outsiders, and bein' well-nigh smothered themselves, they was obliged to fight outward for fresh air. But it don't signify to be tellin' how I got out of there, for I don't exactly know myself. Howsomdever, when I rose and got my breath, I see the bars all around me fightin' among theirselves, makin' the fur fly like feathers at a goose-pluckin', and quite onmindful of the stranger among 'em. I mought have cleared myself then, but my blood was up, and I walked through 'em,

stabbin' right and left, onmerciful as a mad wild-cat, respectin' neither age nor sex. Jist then several old fellers appeared to git a smell of me, and closed in mighty savage. While I fit in front, a rascally old squeezer grabbed me round the neck from behind. I struck backward, feelin' my knife enter his cussed carcass a dozen times; but it didn't loosen his grip, and I felt my strength goin'. At this pint a big bar poked his head up from behind the honey trough, rubbin' his little eyes as if he had jist waked up. In a minute he broke for us.

"'Rowzey,' thinks I, 'it's time for family worship. Now I lay me down to sleep—'

"As I prayed I made a stab at the big he, who shunned the blade, and, to my astonishment, grabbed the beast in front of me with his left paw, sendin' him heels over head; then with his right he tore the feller off my back. I was too far gone to ask questions, but bein' loose once more, I broke for camp. There I barricaded myself in with poles, and laid pantin' and sippin' peach-and-honey until I fairly come to my strength agin. It took me some time longer to git up pluck enough to venture back toward the battleground. Howsomdever, late in the afternoon I did creep down that way, mighty like a sheep dog at first, but bolder when I see that every thing was quiet. Around that honey trough lay twenty-two dead bar, young and old. Gentlemen, I value my reputation too high to weigh it agin bar meat. Gentlemen, I counted them bodies as they

POTATO ROW, BETWEEN ROMNEY AND MOORFIELD.

lay, and you may think I was mighty proud as I viewed the ground. Well, I mought have been, but there was one corpse too many there for my peace of mind. Over by the honey trough, jist where my life was saved, as I thought, by the miraculous mistake of a drunken old bar, there lay two bodies, clutched in a death grip, jist as they had fell fightin'. They were badly tore, and the leaves all around soaked and stained; but as I stooped over to look closer, I felt a cold shiver that froze clean to my bones. There was the white paw, stiff and bloody. Gentlemen, there lay Rough, my old playmate."

The rugged hunter drew his sleeve across his eyes, reached over for the pitcher, and turned it bottom upward over his empty glass.

"Well, is that all?" asked Dick, drawing a long breath.

"Hit's all the liquor," quoth Rowzey, with a dry wink. "Of the story there's yit another pint or two at your service."

"Well, I went to work savin' my meat with a heavy heart, and next day got some fellers up from the settlements with horses and sleds to help me down with it. There was sich a pile that all the neighbors gathered in to look and git a share, and there was a mighty guessin' and bettin' on the weight. Now we had no steelyards nor scales of any kind; but there was old Bill Swanson, who had got weighed onst when he was down to the Kauawha Salt-works, and accordin' to his recollection, which was good when he staid sober (which he never did willin'ly), he drawed jist two hundred and eighty, down weight, on the salt-works scales. Well, we jist laid a stout rail acrost a stump, seesaw fashion, and sot old Bill on one eend and piled bar meat on the other, till we got his heft—which we did; I now disremember whether hit was seven or seventeen times. Howsomdever, none of us bein' scholars enough to subtract that together, we scored the times on a saplin', till the school-master come along to cipher it up for us. But every body 'lowed they never see sich a pile of meat in all their born days."

"And did you never try that trap again, Rowzey?"

"Oh yes; for you see, after old Rough was dead I had no mercy on bar any more, and I sot that same trap over and over. But I

fooled away my liquor and honey; for though my bait was took regularly, I never see bar nor a bar's track in that neighborhood arterward. But onst I see old Bill Swanson lurkin' around thar, and havin' my own suspicions, I left off settin'."

"And did you eat old Rough with the rest?" inquired Dick.

"Mister," said the mountaineer, with a gesture of indignant scorn, "sich a question is a discredit to the feller that asks it. Do I look like a lawyer or a heathen cannibal? No, Sir; I buried him decent and respectable, with all his har on him, jist as I would a Christian friend, and I tarred his name on a smooth clapboard, and stuck it up at his head. And thar he mought have rested in peace to this day; but some of them high-scienced fellers from the East come a-nosin' and a-scratchin' through that country, and mistakin' the grave for an Injin mound, they excawated poor Rough's bones and sent 'em to Barnum's Institute, at Washington city, where I've hearn say they stands in a glass case, as the skeleton of a celebrated Injin chief, between a par of General Washington's old breeches and General Jackson's night-cap, which he wore at the battle of New Orleans."

The narrator heaved a deep sigh, and bowed to the company.

"Not a drop more, gentlemen, if you please. We've all swallered about as much as is convenient at one time."

"And thus," said I, "shall old Rough shine immortal among the stars of history, with a tail as long as that of Ursa Major!"

Now to horse, and ho for Moorfield! Near the close of a long summer's day our travelers were still in the saddle, urging their jaded steeds along the woodland road. Their course had led by Reamer's tavern, through Greenland Gap, and by many other points of scenic interest well worth the artist's and the poet's study, but negligently viewed by eyes and minds so long saturated by rocks and mountains. But when at length they drew rein upon the summit of a hill, the weariness of forty miles' hard riding was temporarily forgotten, and a shout of simultaneous enthusiasm again greeted the valley of beauty and abundance. The ribbed sides and peaked contours of the opposing mountains were already veiled in a sweet violet

haze. The winding river, roofs, and cupolas flashed back the golden rays of the western sun. Fleecy flocks and stately herds dotted the emerald carpets that covered hill-side and meadow far and near. For miles and miles, until lost in the dim perspective, stretched the green corn fields, the armed and embattled hosts of peace, splendid with their million glittering blades and tasseled crests. This beauty, indeed, might the painter dimly render, that subtler charm

the poet convey in golden words; but what art, or combination of arts, could grasp or reproduce that scene as we saw it then, with all its glowing attributes of time and circumstance? The sudden scene-shifting after our thirty days' sojourn in the grim, hard-featured wilderness; the luxurious sense of release from self-imposed privation, of rest from a rough task honorably accomplished; the stifling sweetness of hopes unspoken, ay, unacknowledged, but overmastering even the

ABUNDANCE.

"WELL, DARN MY STOCKINGS!"

stern will of ambition. Quickly succeeding the emotions of the moment came the realization of our present material relations to the world we were just entering, and we halted on the river-bank to cool off and consider.

"Dusty, weather-beaten, unshaven, ragged."

"Dirty!" added Major Martial, stooping to lave his face and hands in the cooling stream.

"Good Heavens!" ejaculated Cockney, as he stood fascinated with horror over the crystal mirror; "can this be possible? Why, at first I thought it was Rattlebrain looking over my shoulder."

Dick had drawn his boots, and attracted our attention to the development by a startling imprecation: "Well, darn my stockings! look at this!"

With me there was a "solution of continuity" at every angle. We were decidedly not presentable, and concluded to stop for the night at Mullen's Hotel.

Our trunks, with reserves, were all out at Mr. Meadows's. We proposed to send a servant with a light wagon to bring them in, when, rather to our surprise, Augustus proposed to accompany him. It would look better, he thought, for one of our party to call at once—not to see the ladies, of course, but simply to signify our return, and make polite inquiries.

"Certainly," replied Dick; "if you are anxious to exhibit your dilapidated carcass, we won't object."

And to our still greater astonishment, Cockney, "accounted as he was," took his seat beside the driver, and departed. In an hour they returned with our baggage, and accompanied by Mr. Meadows, who brought peremptory orders that we should refit at once and join the ladies at supper at his house. Cockney, in spite of dirt and fatigue, was beaming with smiles, and sported a rose in his ragged button-hole. Perceiving that I remarked it, he took me aside and half whispered,

"You may think a little strange, Mr. Laureate, of my apparent eagerness to show myself at head-quarters in this beastly condition, but I had made a promise to Miss Lilly while up on Gandy. You understand?"

"Your conduct has been truly chivalric, Augustus, and you were rewarded with smiles and roses, as you deserved."

"Yes, something more than smiles," replied Cockney, "for she laughed until the tears rolled down her cheeks; but I don't think it was intended to make game of me, for, observing my mortification, she made sweet amends by giving me this rose."

ROSES.

OUR NEAREST NEIGHBOR.

[Second Paper.]

FLOATING GARDENS OF MEXICO.

THE best place to see a town usually is from the church-top. That is what church-tops are made for. So climb up here with me and see the city. The surroundings are fair to look at, of course. I told you about Guadalupe as we rode by last night, which was last month. See it over there to the northward. A brown range of hills looks golden in the sun, like Willis's beloved tresses, "brown in the shadow, golden in the sun." At their foot are three temples, one a little above the others, the larger the lower. Those three betoken the three places where the Virgin appeared to an Indian trudging over these hills on a visit from his wooded wigwam to the town. Thrice she ordered him to build her a temple here; thrice he hesitated to obey, though each time he reported the visitation to his priest in the city. The last time he demanded a sign; she ordered him to throw his serape on the ground, and filled it with flowers gathered from the barren and burning rocks. As he opened his blanket to show her gift to the priest, lo! his flowers had changed to a flowery Madonna sweetness, with a bud of a boy in her arms, as on a branch. That greasy blanket with its Madonna portrait is seen to-day over the high altar by every believing eye, located just where he spread it and she filled it with herself. A frame of solid sil-

ver incases it; balustrades of like metal go from that altar to the choir—fifty feet length of pillars and shafts and balustrades of the shining stuff. The silver I can vouch for; the picture, *quien sabe?*

It was well got up, this scheme. The Indians were conquered but not converted. Unless they changed their faith they might change their masters. So, the Spaniards not yet two years on the throne, this miracle occurred, and the Virgin became an Indian to Indians that they might accept Romanism, and the emperor and his sub-plunderers be safe in their possessions. It was a success. The Virgin of Guadalupe became the goddess of Mexico. Divine honors were paid to her. Temples went up every where, and shrines in every temple. Her picture on its blanket hangs in every house and hut, above the counter of the merchant and the bar of pulque dram-shops, over the forge and over the bed, here, there, every where. Books by the thousand and sermons by the tens of thousands have been written and preached upon her virtues and her powers. In one of the books in the library of Vera Cruz she is gravely said to have got around God. Undoubtedly she got around this people, and effectually took them in. The upper of these three churches, where she first appeared, is reckoned the most sacred. Here

are the tombs of the chiefest dignitaries of church and state. The ascent is lined with trophies of her ability to save; one a solid mast and sail of stone, erected by a believer whose life was saved from shipwreck, as he believed, through her interposition.

The next is near the foot of the hill, and incloses a chalybeate fountain, which burst forth when she lit there on her foot. "The iron entered her sole," irreverently remarked an American sinner as he gazed upon the fountain. A blaze of gilding covers the chapel connected with this beautiful legend of the fountain. Its walls are

"Thick inlaid with patines of bright gold."

The largest church, where her blanket portrait hangs, is a few rods farther out on the plain. There is the chief outlay of gold and silver and precious stones. On its wall is an inscription to her as the Mother of God, Foundress and Savior of the Mexican People.

But the priests of the Virgin have an eye to the main chance. They turn her into lottery speculations, and make her useful to their often infirmities. At the doorway an old servant of the temple sold her pictures, beads, and other ecclesiastical knickknacks. A picture I bought was wrapped up in a lottery ticket like this:

CHAPULTEPEC.

THE LOTTERY TICKET.

TREE OF MONTEZUMA, CHAPULTEPEC.

This lottery of the Virgin is one of the most flourishing. The monthly drawings draw daily pennies to their purse. It makes the priestly pot boil. Time was when luxu-

ries were theirs; but they are hard times now for priests, and so they have to thus turn an honest penny to a dishonest use. But these popular orgies are fading out. True, each December witnesses multitudes from over all the land attending her annual festival. The Indian honors it with the dances of the ancient times. The rites are more Aztec than papal. Yet the Jesuit begins to say that faith in the Virgin of Guadalupe is not essential to salvation. The Bible will replace the Jesuit, and the trick by which he has held their souls captive these three centuries and a half will cease to possess them more. Christ the Liberator is coming. He is nigh—even at their doors. This old blanket, like that of Bartimæus, will be

THE BATHS OF MONTEZUMA, CHAPULTEPEC.

thrown away, and all the people come to Jesus, and be healed.

To the northwest you see another hill and tower more famous still, for this was a seat of power, if not religion, before the Spaniards entered the land. It is a solitary hill, apart from all others, thrust out into the plain like a nose upon the face of nature. It is a huge rock, whereon the waves of war have beat for a thousand if not for two thousand years,

"Tempest buffeted,
glory crowned."

Montezuma reveled there, and Cortez and many a viceroy since. Iturbide rioted there, and Maximilian has left many a reminiscence of himself in frescoed fairies and fairy gardens, and even in the monograms on the bowls and pitchers. Juarez last honored it with a feast to Seward—the republican saved welcoming the republican savior.

Chapultepec is just about as far from town as Guadalupe, the shrines of authority and of religion being each exactly three miles off. Strange enough, their city centres, cathedral and palace, are on the same square. The ride thither is over a charming avenue, called the Empress Road, for a long time called the Road of the Mad Woman. It is straight as an arrow path from an Aztec bow, lined with young trees, well wet at least half its way, and every thing but safe. That you take the risk of. Carriage riders or horsemen may find themselves lighter of purse and heavier of heart before they reach the city streets, though they are only a mile out. But morning brings no danger, or at least fears none. A prancing horse that has only known the saddle gayly dances with you as his partner from the Alameda to the gate of the grounds. There you dismount, if you so desire, or pass in, and on, and up.

The first thing that strikes you is the woods. People have often been struck with their substance. They are more ancient than the palace. They are the tall, broad-limbed cedars which Yosemite delights in. Some are twenty feet through. Large groves of them linger round the base of the hill. Several are very large, and one rises to the dignity of bearing Montezuma's name.

SAN COSME ACUEDUCTO, CITY OF MEXICO.

Here, too, are the baths of Montezuma, the best just outside the grounds. Much frequented are they yet, though not by him, unless his spirit needs ablution, as most spirits do, at least when in the flesh. The one inside the gate is a walled hole in the ground. It is close to the entrance, and is dry. But a few rods farther off, in what was undoubtedly his park, there bubbles up forty feet the clearest, sweetest pool I ever saw for bathing. Fifty feet square is the bowl, forty feet deep. You can see the moss and ferns growing on the bottom, and behold the hole in the rock whence the waters gush out. There to plunge I found delightful after a racy ride of an hour, just as the sun was yellowing Chapultepec, and with only a cup of coffee between my appetite and last night's supper. A shallower basin, paved and walled to suit those who can not swim, adjoins the fount, and is hardly less luxurious; while ladies have a suit of similar luxuries adjoining, all opening on ceaseless gardens.

Taking this swim, we can drive through the woods, that open in some places to quite respectable forests. We climb up the hill past two grim idols still remaining hidden in the foliage, the gods of Montezuma. The sides are barren of all trees, save the Peru

TREE OF TRISTE NOCHE.

or pepper tree, a sort of willow-looking bush that grows to quite a height and solidity at times, and grows every where. The driest and hottest soils are not too dry nor too hot for it. Red berries hang in clusters over it, the choice fruit of birds, though startlingly pungent to man.

The court just below the top stops the horses, and a few steps land the visitor amidst a cool and shady garden, surrounded by broad verandas, where the singing and shining birds of the country (very different species here, as elsewhere) shine in their exquisite plumage, or melt in more exquisite song. Long suits of rooms command the superb valley, its city, villages, plains, lakes, and mountains. No such panorama has any other palace in the world. Windsor, the next most beautiful, is tame to this. Schönbrunn, Potsdam, Fontainebleau, and all, are flat and cheap to this rare combination. But then one is apt to live longer in those palaces, and to die a more natural death, and so is content with humbler luxuries. From Montezuma to Maximilian, the occupants of this hill palace have many of them made a violent exit from their troublous honors. Juarez dared not stay here after night-fall without a large body-guard; and it is abandoned to occasional state breakfasts, the heart of the city being judged a safer residence.

Another road out of the town passes by the aqueduct of San Cosme, that marches cityward like a troop of Roman soldiers, solemn and strong. Its arches rise gray

and black and moist, and are touched with green mosses—as artistic a line of beauty as ever strode along a busy city pathway. Horse-cars, swiftly moving—no slow coach is that institution here—loaded donkeys, cavaliers, burdened men and women, throng the street, but the aqueduct of San Cosme never abates its haughty, serious air.

This is the famous road over which Cortez made his sad attempt to escape an infuriated town, rendered doubly mad by an interference of his lieutenant, in his absence, with the bloody rites of human sacrifice. The town woke up before they were well start-

ed, chased them along this dike, crossed with wide ditches and surrounded by water, dragged them off the narrow causeway, caught them as they tried to clear the chasms, their first ponton-train being pressed into the mud of the first broad ditch, so that it could not be taken up. The band of adventurers lost their arms, ammunition, horses, precious metals, and gems, and all but a score were left along the ravine, a prey to the destroyer. But in that score was Cortez, and so all was saved. A few days later he and his suit cut their way into the myriads of Otumba, struck dead their chief, and began their work anew. The tree where the few survivors foregathered after that Triste Noche, or saddest of nights, is still preserved—a sacred memento to our Spanish-blooded Mexican, a less agreeable memorial to his Aztec brother.

The favorite retreat for the gentlemen of the town is at Tacubaya, four miles from the city, and not far from Chapultepec. The gardens of these lords of the land are exquisitely lovely. They are full of parks, ponds, groves, pleasant walks, flower beds, strange trees, and stranger plants. They rise and fall in easy grace. From their nooks and knolls the eye takes in the mighty volcanoes, mingling their coolness with the fervor of the scene. But these choice seats are without inhabitant. The rich occupants dare not dwell a night in their walled and barred inclosures without guards of many men, for the kidnaper is abroad, and they are too valuable for ransom to be left qui-

etly sleeping here. So the sumptuous mansion, with its courts full of fountains and fragrance, is a deserted palace save for occasional festas.

The most romantic of the environs of Mexico is that to the southward. Here enters the canal that brings the city most of its provender. Here lie the moist and floating gardens, whose culture never ceases. Always here "the plowman overtakes the reaper, and the treader of grapes him that soweth seed." A ride in a boat, or, better, on a horse, is one of the chief entertainments, provided one is well out of the town. The difficulty is in getting out, for a dirtier, crookeder, viler pass from a big town one rarely finds. The northern egresses are handsome, the southern execrable.

The real life of a city is not in its surroundings, but in itself. But when out, you canter along the soft path by the side of the ancestral canal, whose waters are covered with boats laden with grass, lucerne (a fresh sort of green, the delight of the horse), with water-melons (appropriate name for such carriage), lettuce, cucumbers, and all the

produce of the sauce gardens near large cities. On the other side of the path are floating gardens, whence the boat-loads come, which are made by constant deposits on the springy soil, that sink with use, and are replaced with new layers of earth. Farther south the soil is yet more springy and floating; here it is simply spongy, but does not move with the moving waters about and under, though these waters only move when stirred by the pony of the owner getting round his patch.

All these canals terminate in the market-place of the town, the busiest hive of a market-place I ever saw. No European plaza, except on fair-days, no Baltimore street centre of a morning, or Cincinnati of a night, equals the crowd and chatter and push of this lively spot at almost every hour of the day. The boats' prows stuck in among the shops and stalls add to the excitement. Sunday morning is their fair, and such a crush and hubbub are then encountered here as would forever cure the most radical anti-Sabbatarian of his desire to show his independence of the Scriptures by a desecration

CANAL NEAR THE CITY OF MEXICO.

THE MARKET-PLACE, CITY OF MEXICO.

THE PALACE OF MEXICO.

of the sacred day. Each vocation has its allotted place. One narrow avenue is filled with coffin-makers, driving a brisk trade with their black boards, for black is the color of your "wooden jacket" in Mexico. A dozen shops and several dozen workmen make this dismal trade hilarious.

Another long alley is appropriated to the eating business, and great stew-pans, over handfulls of coals keep hot the flesh soups and bones, while on the ground around sit groups of eaters, dipping their bread in the sop or sipping chocolate or coffee, each of which beverages they know how to compound excellently well.

Being in town, let us get out of this noisy and not agreeable market-place. A few steps bring us to the Grand Plaza, the finest in the country, and one of the finest in the world. It is not less than a thousand feet square, more rather than less, I should say, from the guess of an untrained eye. In its centre is a pretty garden, the work of Carlotta, whose taste for flowers has left its pleasant mark in many places. The tropical plants flourish here, though not as abundantly as in Vera Cruz.

On the south stretches the President's palace—a palace and a castle; for here are stored soldiers and supplies for a siege; here are the archives of the government; here are the halls of legislation, or were till a fire last year destroyed them, and since then they have had no local existence; here are the apartments of state, that long line of

windows to the right of the door as you look at the building being a single Hall of Embassadors, lined with portraits of Mexican grandees, among whom Bolivar and Washington are alone admitted, the two other successful American revolutionists. No sign of Maximilian is allowed, though he filled the palace with his busts and his portraits, and wrought his monogram into every conceivable spot and stuff—chair, hanging, couch, and all. Iturbide, the father of the republic, though an emperor, is the most honored with portraits and mementoes.

Opposite the palace, across the very broad plaza, is a long arcade, wide and shaded, and full of all manner of shops. Here are silversmiths plying their craft or selling their dainty lace-work of silver, which so bewitches you to buy, and so easily spoils after the buying; here are dealers in feather-work, once the most famous trade of the country, now reduced to imitations on cards of the birds of the region—a pretty trade still, though poorly patronized; toys of every sort, earthen trinkets of every shape; hat stores full of broad sombreros, rebosas, the brown and blue mantles with which every working-woman's head and neck are covered; coffee-stands and book-stalls—all sorts of traffic fill these spacious walks with noise and profit.

On the left of the palace are more barracks, plain buildings, but strong, and on its right the cathedral towers. It is Moorish rather than Gothic, as all their churches are.

INTERIOR OF A MODERN MEXICAN HOUSE.

It stands on a plateau, raised several feet from the pavement of the plaza, has adjoining it the sagrario, or parish church, profusely carved without and gilded within, the carving cheap, and the gilding faded. The inside of the cathedral is less grand than that of Puebla, but it is also less gloomy. It is cut up to fit divers crowds. The altar by the chief entrance is usually thronged. The choir behind it is a stately mass of carving. Two beautiful balustrades, of an amalgam of gold, silver, and brass, connect the choir and the high altar. So rich are they that an Englishman offered to replace them with silver, and was refused. Beautiful figures of like precious metal hold candelabra along this walk. The altar is a gorgeous pile of figures in marble and more precious stones.

The area in front of the cathedral is full of people selling their wares—never so full as on Sabbath mornings. Here is the lottery-ticket vendor—most numerous and most busy of all. Male and female has this church created them—chiefly old people. All their sales have a percentage of benefit for the priest. They all have pious names. The Lottery of the Immaculate Conception, the Lottery of the Holy Spirit and the Holy Trinity, of St. Joseph and Mary, of the Virgin of Guadalupe, are among the favorite names. The sellers are each numbered, and the church keeps steady watch over this important revenue. Here is a velocipede course, and children enjoy it. The match boy, pert and pretty; the cigar boy; the ice-cream vendor—a

very poor cream; the print-seller—every trade that can be disposing of its wares before this sacred portal. How much is a whip of small cords needed here and now, for those who make this house a house of merchandise! But merchandise of souls goes on within. Shall not that of lesser wares consistently proceed without?

At the corner of the cathedral stands the Aztec calendar stone, once placed on their teocallis situated on this spot—the best monument extant of their learning and civilization.

This plaza is not least pleasant by moonlight. Few

bands play deliciously, as this Indian band does. No superior sweetness or variety did the best foreign band exhibit at the Jubilee concerts than these brown men exhibit here. Their touch is soft and swift and strong. They catch the soul of the composition, and

WATER-CARRIER.

bring it palpitating before you. The moon seems to shed a directer ray. No Venetian night ever excelled these torrid-temperate perfections of moonlight and melody.

The chief street of the city leads northward from the plaza. It carries different names with each block—Street of the Silversmiths, of the Profesa, of San Francisco. The first block was so called because it was once occupied by silversmiths. Two or three of them still have their forge, and work their silver before every passer-by. But jewelry shops, cigar shops, and goods stores have crowded out the smiths. The Profesa is so named from a church and convent on its corner, the church extant, but the convent gone partly into the comfortable Hotel Gillow, partly into a street, partly into ruins. Among these is the Hall of Chastisement, over whose arch were frescoed quaint devices of piety and pithiness.

Episcopal Missionary Society, and are also fitted up for a church. They are one hundred feet square, have arcades fifteen feet deep around them, and graceful columns of polished marble, with carved capitals, rise one above the other along the front. No church in Rome has an equally admirable cloister. It will be all the more beautiful in its new service.

On this street stands the palace of Iturbide, now a hotel, the stateliest private structure in Mexico. Its carved front looks ancient, though it is only fifty years since his brief and troubled reign. Opposite is the plain dwelling of Lerdo, the present President—a modest little man, with no oppressiveness of manner. He is slightly bald, has small but sharp features, wears a Colfax smile, and is a quiet, self-poised, agreeable gentleman.

If you walk up a little farther, you see on the right a porcelain-faced house, in quaint tiles of a Dutch look, once an aristocratic residence, and still, though faded, one of the haughtiest in the town. Adjoining on either side are the residences of the chiefs of the money market, the Vanderbilt and Drew of Mexico—Barron and Escandron. Outside of no especial attraction, like all houses here, they are inside elegantly fitted up, and provided with open courts, fountains, and abundance of tropical flowers.

Opposite them is the home of our consul-general, one of the most faithful and intelligent and popular of our officials. A little farther up, and on the next street, parallel, called Street of Independence, is the home of Rev. Dr. Butler, the pastor of the Anglo-Saxon Church, and superintendent of the Methodist missions. That street received that name because

THE AZTEC CALENDAR STONE.

The San Francisco section was formerly devoted to its convent, the whole of one side of the block being thus appropriated. This was the first to be confiscated to the government, and transformed into residences and all the variety of a city block. The church and chapel became the property of the Church of Jesus, which Dr. Riley chiefly organized. A garden entrance of a hundred feet brings us to the chapel front, carved and comely. The inside is lofty and cheerful. The cloisters of the convent, still more beautiful, are the property of the Methodist

it was opened through the convent by Commonfort in defiance of the authorities of the Church, and was the first public act which led to the present liberation from all churchly domination. This street terminates not far up in the Alameda—the public park of Mexico. This park is about forty acres in extent, and has every attraction but accessibility and safety. Walks wind through it, but each plot of shrubs or flowers is fenced off from intrusion. You are not told to “walk on the paths;” you can not help it. Fountains encircled with stone seats offer

FIRST PROTESTANT CHURCH.

you rest, and when the bands play, and the waters too, more than rest they give, unless it be on the Sabbath, when it chiefly is, and then the more resting here the less rest, for conscience disturbs ease, and robs enjoyment of its delight.

The Alameda is not safe at any hour. Gentlemen are robbed with impunity. So the trail of the serpent is over this delightful spot.

The eastern side of the Alameda is the same street we went out on to the Triste Noche, the street of San Cosme. Broad and lively it is above all other thoroughfares. Across from the park stands the church built by Cortez, and where his portrait is preserved. Farther up is the cemetery of celebrities, where presidents and generals and lower dignitaries lie in their ashes—often only thus, for the urn

after five years receives the lordliest dust, unless a tomb in perpetuity has been secured, which is sometimes the case. Most of them died in their boots, violently. It matters not much. They died. Finis is finis.

"The path of glory leads but to the grave."

From graves to funerals is an easy step. I have seen a group of men carrying the body on their shoulders, while the carriage came empty behind. This is a sign of affection—a pleasing compliment to the dead. Usually the American funeral is the Mexican, with plumed hearse and horses, and much ostentation of woe. But occasionally these affectionate expressions are novel and pleasing. If we still walk on up the San Cosme road, we shall come, after a mile or more, to where the aqueduct suddenly wheels westward, and turns its face toward Chapultepec. Opposite this turn you see the shaded gateway of the English cemetery. The American adjoins. Each is neatly kept; but the English has a prettier array of shrubs and

SOLDIERS' MONUMENT IN THE AMERICAN CEMETERY.

trees and flowers, because they take more pains, or because they have more, and more wealthy, residents here, or because they have a more cultured taste for landscape adorning. They are getting sadly populous, but still remain undisturbed—a grave rebuke to the loose Latin notions concerning the dead, whose temporary permission to occupy their niches in the wall is a sad proof of the powerlessness of their faith. Their cold mottoes are sadder, for a glimpse or glow of faith, such as makes the under-ground catacombs light, rarely finds a place on their transient slab. Our higher faith strikes a higher note even here, and the grave of Protestantism is a proof of its superiority.

Inside the American is a monument to our soldiers who fell before Mexico. It is somewhat touched with time, and needs a little attention on the part of our officials or visitors. A grander monument to their valor is erected by the Mexican government at Molino del Rey, where the hardest battle near the city was fought—a monument, like that

INQUISITION OF SAN DOMINGO, CITY OF MEXICO.

of Bunker Hill, to a defeat, not, like that, to an ultimate victory.

Stroll back down the same street of San Cosme, which takes as many names as a much-married widow ere it sinks into its last and first loves—the cathedral and the plaza. You pass the Tivoli Gardens—if you can pass them, and not turn in to enjoy their delights of scenery, viands, and music. Here the gentry take their breakfasts from twelve to four. Every sort of place for a

table is prepared; boxes of quaint pattern high in the tree-tops and darkling amidst shrubbery. The gardens of Paris and Berlin are poor to those of San Cosme. Having sipped and nibbled your full, you still stroll down the street, past the Alameda, into the thick of the town. Turn to your left down a long street, and you will come out on a square famous of old for the burnings of the Inquisition. In its centre an iron stake stood, which men of to-day say they have seen. To it the victims were tied, and burned. Now the place is open, and its torture-post vanished. Across the way from the church is the Inquisition, now the custom-house. On clearing it up and out, it is said a cell was discovered built in the wall, and on opening it four skeletons sat crouched in death. Before they

THE PRISONERS OF THE INQUISITION.

fell into dust their photograph was taken. It is a dreadful grave-stone of a dead system—dead not because of its own desire to die, not because its managers had outgrown it, and voluntarily abandoned it, but because a power had grown up around and above it that compelled its unwilling abolition. It would break forth to-day had its Church her former power. It only awaits growth and opportunity to reproduce the starved inmates of an inwalled cell and the stake of fire. Such opportunity only truer Christianity can prevent. Here yet is the place of execution, and marks are seen on the wall where revolutionary victims have been shot.

The city has unusually beautiful outlooks at almost every corner. Where the four streets meeting open through the whole city, you can see in each direction the green

fields and brown hills. When you look south and east, there rise close to the eye through the tube of a telescope the snowy scalps of Iztaccihuatl and Popocatepetl. They form a grand frame for this setting. No city of earth has its like. Some have finer views of the sea, but none an equal glory of land.

Its climate is as enticing as its vistas. The thermometer never rises above seventy-two, nor sinks below sixty. Summer and winter, night and day, are the same.

If one wants a morning always clear and stimulating, a noon never sultry, and a night made on purpose for sleep, let him take steamer for Vera Cruz. If weak of lungs, let him rest in Orizaba. If not, he will find nothing more delicious on this planet than the city of Cortez and Montezuma, the capital of Anahuac, the old and new Mexico.

MY SLAIN.

I

THIS sweet child which hath climbed upon my knee,
This amber-haired, four-summered little maid,
With her unconscious beauty troubleth me,
With her low prattle maketh me afraid.
Ah, darling! when you cling and nestle so
You hurt me, though you do not see me cry,
Nor hear the weariness with which I sigh
For the dear babe I killed so long ago.
I tremble at the touch of your caress;
You stab me with your dove-eyed, innocent faith:
O cruel knives of whetted worldliness,
That laid mine own child-heartedness in death,
Beside whose grave I pace for evermore,
Like Desolation on a shipwrecked shore!

II

There is no little child within me now,
To sing back to the daisies, to leap up
When June winds kiss me, when an apple bough
Laughs into blossoms, or a buttercup
Filters the sunshine, or a violet
Gladdens in the glad dew. Alas! alas!
The meaning of the primrose in the grass
I have forgotten, and if my cheeks are wet,
It is not with the blitheness of the child,
But with the heavy sorrow of sore years.
O moaning life, with Life irreconciled!
O backward looking thought! O pain! O tears!
For us there is not any silver sound
Of rhythmic wonders springing from the ground.

III

What have I gained? The sapless bookish lore
That makes men mummies, weighs out every grain
Of that which was miraculous before,
And sneers the heart down with the scoffing brain;
The skeptic's peering, analytic ways,
That dry the tender juices in the breast,
And put the thunders of the Lord to test,
So that no marvel must be, and no praise,
Nor any God except Necessity.
O earthy days, that I have served so true!
O arid husks! O bare and fruitless tree!
Take back your doubtful wisdom, and renew
My early foolish freshness of the dunce,
Whose simple instincts guessed the heavens at once.

MARBLEHEAD.

"Three fishers went sailing out into the west—
 Out into the west as the sun went down;
 Each thought of the woman who loved him the best,
 And the children stood watching them out of the town;
 For men must work, and women must weep;
 And there's little to earn, and many to keep,
 Though the harbor bar be moaning."

THE German word *Anderheit* means "otherness." A thing passes into *Anderheit* when it becomes radically different from what it has been. A great many old New England towns are going through this process; they are very rapidly passing into "otherness." This is especially true of the seaport towns near Boston; of Portsmouth, of Newburyport, of Salem, and of Marblehead. That the place last named is near Boston will probably be news to the average man not of New England birth. It is generally supposed to be upon the Cape, i.e., Cape Cod. This misconception is associated with the mental image of a sandy waste inhabited by a race of fishermen. Add the Marblehead dialect, and the figure of "Flood Oirson," as depicted by Whittier, and a group of boys "rocking" the unwary foreigner, and the or-

inary idea of Marblehead is tolerably complete. But this idea, though not without some merit of its own, has not the merit of comporting with the facts that make up the claim of this old sea-port town for some more general interest and recognition than it has latterly received. Time was when Marblehead got its full share of these commodities without any challenge such as I offer here.

Marblehead is not on the Cape; not on any cape, in fact, but on two small peninsulas connected by a narrow strip of sand and pebble. It is northeast of Boston sixteen or eighteen miles. In going there one takes the Eastern road to Salem, then a branch road which, midway between Salem and Marblehead, touches the head of

Salem Harbor, at high tide a lovely sheet of water, with one little "emerald isle" in it, having more the appearance of a great inland lake than of a little arm of the sea. The ride by rail is very pleasant almost all the way from Boston. At first there is a succession of dreary places, new and bare; then the conductor shouts "Revere!" and while your next neighbor is telling you that this is where the dreadful accident happened a few years ago, you glide out upon the great salt marshes, where haply the hay is being tossed into huge stacks. The marshes are not nearly so monotonous as they at first might seem. They vary with the changing seasons and the changing tides. But it is at low tide, at sunset, that they put on their most magnificent array. At such times I have seen streams of liquid gold flowing through banks of crimson and purple. After hot days in the city how grateful is the breeze that comes in from the sea between Nahant, that stretches far out on the right, and Phillips Point! When the sea is at its bluest, and the marshes are at their greenest, the train speeds all too fast, such a feast of color is

spread out before us. Below Swampscot, "Salem's great pasture," if it is July, gives color of another sort, the rough hills being covered with wood-wax, or "dyer's-weed," with which in splendor not even the golden-rod can compete, though that is nowhere more sumptuous than here. All the coast along here is a series of peninsulas. East Boston is one; beautiful Nahant is the next; Phillips Point, just below Swampscot, is the next; then comes "Marblehead Neck," as the outer of the two peninsulas which form the township is called; then Marblehead proper; then Salem. Between the Neck and the town proper lies the harbor, half a mile or so in width, a mile and a half long, and for depth one of the deepest on the Atlantic coast. The *Great Eastern* could swing at anchor here.

But the harbor is not so safe as it is deep, opening as it does with a capacious mouth at the northeast. A heavy northeast storm will set adrift every vessel in the harbor. After the "Minot's Ledge storm" the beach at the head of the harbor was strewn very thick with schooners, fortunate in finding such an easy resting-place. With the exception of this beach, and several coves, the shore of the harbor is rocky and remarkably precipitous, in places almost perpendicular. The rocks on which the light-house stands at the mouth of the harbor have this character. The fishermen steer so near that one can touch them with an eight-foot oar. "Half-way Rock," called "Half Rock," is even more precipitous. This rock is three miles out, and gets its name from being about half-way from Boston to Cape Ann. It is some forty feet high, and in a heavy storm, receiving the full force of the sea, the surf is thrown more than a hundred feet in air, and the rock looks from the shore like a great fountain. It was for many years, and may be still, the custom for outward-bound fishermen to throw coppers

"THE CHURN."

on this rock, for luck, as they sailed by it. And it was also the custom for adventurous boys to land here and collect such of these offerings to Fortuna as had stuck in the crevices. The adventure must have been a great deal more than the reward.

There is an ancient and popular rhyme which indicates in general terms the geological structure of the town, also that of Salem, together with some reflections on the gastronomy of Beverly and the morals of Lynn; and all this in a quatrain:

"Marblehead's a rocky place;
Salem is a sandy;
Beverly's a beany place,
And Lynn it is a dandy."

There has never been any love lost between these neighboring towns, but their bark has been worse than their bite, and in cases of emergency they have stood by each other manfully. In 1774, when Salem had her biggest fire, it was the men of Marblehead who put it out, and the records show that the Salem people were not ungrateful. They not only passed high-sounding resolutions,

but they voted the Marbleheaders one hundred and thirty-two breakfasts, and I forget how many gallons of gin. The rocks of Marblehead are not so rough and jagged as those at the Isles of Shoals, but they are much more beautiful. They do not carry back the mind to such a violent commotion, not being so twisted and gnarled. Their color is a perpetual pleasure to the eye, and again, unlike the rocks at Star and Appledore, they border fields and farms of wonderful fertility. All along the shores there are dikes of greenstone worn out by the action of the sea. When a heavy sea is rolling in one can sit for hours at the head of these dikes, listening to the thunder of the waves, and watching the clouds of spray. One of these dikes, called "The Churn," which, being at the back of the Neck, is exposed to the full force of the sea, often affords a grand and lovely spectacle. The end of the dike is nearly vertical. When the waves strike it the surrounding rocks jar with the terrible concussion. The foam is tossed high up into the air, and when the light is favorable a rainbow lends its evanescent beauty to the scene. The climax of beauty is reached in the rocks upon Cat Island, sometimes called Lowell Island. Here the rocks display the loveliest colors, the most striking contrasts, the most delicate gradations. The rocks bared by the tides are rich with reds and browns; those farthest from their reach are tender with soft greens and grays, thanks to the lichens that they nourish with all needful sustenance.

Cat Island is associated with one of the most interesting episodes in the history of Marblehead. In 1773 a local excitement for some months took precedence of the great public affairs that were at that time arousing so much interest. This excitement was the "Small-pox war." It seems that Elbridge Gerry, Azor Orne, John Glover, and his brother Jonathan had bought Cat Island and established there a hospital for inoculation. The town had granted them permission, but the apprehensions of the more ignorant being excited, the permission was revoked. The proprietors, however, continued their work, and at length received and successfully treated some hundreds of people. But somehow the infection spread in the town, and the hospital was held responsible. One January night a party of men from the town set fire to it, and it was burned to the ground. The proprietors were mightily incensed, and arrested two of the offenders, who were put in Salem jail. But five hundred of their townsmen were soon battering at the doors, and before the military, which had been called out, arrived, the prisoners were on the way to Marblehead, where a promise was extracted from the proprietors of the hospital to abandon the prosecution. But the Salem sheriff, thirsting for justice as for

blood, called out five hundred Salem men to march with him to Marblehead and re-arrest his prisoners. To his dismay, he learned that six or eight hundred Marbleheaders were armed and ready to receive him. Dreading the results of an encounter, the proprietors' "bugles sang truce," and the small-pox war was over. But in those troubled times it was a terrible misfortune for the people of the town to be arrayed in opposition to their most trusted leaders, Gerry and Orne and Glover. Gerry was a representative in the General Court, and one of the famous com-

ELBRIDGE GERRY.

mittee of correspondence with Hancock and the Adamses. He threw up both positions. The letters of Samuel Adams to him at this time are full of grief and anxiety. Neither Gerry nor the town could be spared from full participation in the crisis that was pressing harder every day. And before long Gerry relented, and the local war was soon almost forgotten in the vaster interests of the war for Independence.

The principal entrance to the harbor is between Cat Island and Marblehead Rock, which is not far from the eastern end of the Neck. This rock for a long time had for a beacon an old pulpit from one of the Boston churches, and it seemed a fine touch of poetic justice that a thing from which so much noise had proceeded should be compelled to listen to the infinite noise and tumult of the sea. The other entrance into the harbor is called "Baker's Island way." Baker's Island has two lights upon it.

"Two dim ghosts at dusk they seem,
Side by side so white and tall,
Sending one long, hopeless gleam
Down the horizon's darkened wall.
Spectres strayed from plank or spar,
With a tale none lives to tell,
Gazing at the town afar
Where unconscious widows dwell."

GREGORY STREET.

There is many a picturesque island and many a dangerous reef and rock here in the inner bay. The Gooseberries are not at all sour-looking, as their name suggests. The Miserly Islands are called so to signalize some misery of shipwreck long ago. Pope's Head has brought disaster and chagrin to many a returning fisherman. One schooner that ran upon this rock was good enough to get off again, and, while her crew had gone up to the town to see their wives and babies, to make her way up into Little Harbor. Another was much less accommodating, for having been left there in the night, the crew, returning in the morning, found that she had given them the slip. Half-way over to Cape Cod she was picked up by a vessel that made claim for salvage, and the claim had to be allowed, "rough" as it was upon the owners and the crew. The lower part of the town is called Barnegat, and the name suggests that its inhabitants were once Barnegat wreckers; but, in truth, wrecks have been like angels' visits on this rugged coast, fortunately for those who sail the sea. Not of Marblehead, but of several other places, is the story told of a day when somebody came rushing into church in meeting-time, shouting, "A wrack! a wrack!" whereupon all the men sprang to their feet, and were making off; but the minister shouted after them, "Hold on there! Let every man have a fair start. Wait till I get to the end of the broad aisle." Only two vessels have been wrecked near Marblehead within the writer's memory. One of the wrecks was more comical than tragical—that of the old *Chusan*, which, missing stays in calm weather, went upon Jack's Rock, which is only a few rods from

the fort at the mouth of the harbor. Tugs were brought down from Boston to pull her off, and cables were strained and broken, and timbers were wrenched away,

but the old ship would not budge. Presently there came a storm, which got her off with ease, but in a thousand pieces, scattering along the shore her freight of gum-copal, of which every young man in the town procured a piece, with a fly in the middle, and thereof made a heart for some dear Dulcinea.

Marblehead can boast no beach of equal length and smoothness with Nantasket and Nahant. The longest is less than a mile in length, and it is heaped with pebbles far below high-water mark, and far above it. Longfellow's *Fire of Drift-wood* and Hawthorne's *Foot-prints on the Sand* had here their local birth. The beauty of the pebble compensates for any lack of sand. The porphyry pebbles, curiously veined and marked, are not less beautiful than the marbles we bring home from Rome, and they are bits of older ruins. The larger pebble is in great demand for ballast; and one of the pleasantest sights on midsummer days, while sitting on the cliffs, is the droghers rocking gently at anchor in the offing, while the men are filling the dories on the beach and running them off through the surf, up to their waists in the water.

"I sit and wonder what the cliffs would say
If they could speak, remembering the day
When first, 'Thus far, no farther,' it was said,
'Here thy proud waves be stayed!'"

"So wondering how strange it is and still,
Save where a mile away the droghers fill
Their battered dories with the shingly store
Of the long-hoarding shore!"

A more exciting scene is that presented by the great yacht races. The home stretch is generally parallel with the Neck, and from

the headlands it is sport indeed to see the mighty-winged things go fleeting by—

"To watch the race with neither hope nor fear,
Since none than other is to me more dear;
My prize the perfect beauty of the sight—
Unselfish pure delight."

The highest honor that the harbor knows in these degenerate days is when the New York yachts, the night before the race, come in for harborage. Then all is life and motion. A hundred dories dance around the handsome creatures that lie anchored off the wharves, whither the towns-folk come flocking down. There is much talking and swearing, and betting of the most harmless character, the stakes not being put down, and for a few bright hours the harbor seems to renew its ancient rapture, if it does not experience a keener joy than when a score of vessels bound for Bilboa were waiting for the wind to blow them fair.

There was a time when the headlands of the town and Neck were covered with a more anxious crowd than ever watched the generous rivalry of a regatta. That was the day when the *Chesapeake* and *Shannon* had their duel in the offing, when brave, foolish Lawrence, dying, pleaded, "Don't give up the ship!" The whole dreadful scene was visible from Marblehead, made more pathetic by the fact that there were men of Marblehead on board the *Chesapeake*. I have heard one of them tell of the horrors of that day, of the hope, of the desperation, of the butchery, of how he, with his board-

ing hatchet, clove his man through to his clavicle. I have heard one of the mothers tell of how she left her wash-tub, and went, bare-headed and bare-armed, down to the Head to see the dreadful fray. A few days later poor Lawrence had a hero's burial in Salem, but the British flag hung at his vessel's peak, and the survivors of her crew were prisoners.

The streets of Marblehead have from time immemorial been regarded by "the stranger within her gates" with wonder and amazement. Nor are these sentiments unnatural. I have known Marblehead people so public-spirited that they would swear that every street in town is a bee-line; and this we may allow; but the bee must be no honey-laden but a honey-gathering one—a wandering, meandering, tergiversating fellow. The reason for this is evident. The strike of the syenite and greenstone ridges is in a northeast and southwest direction. The thickly settled portion of the town is made up of six or seven of these ridges, with intervening valleys. In fact, the harbor is the deepest of these valleys, and the Neck the highest of the ridges. This configuration determines the direction of all the main streets. They follow the valleys and the ridges. Sometimes the fronts of the houses are a thin veneering several stories high on the face of the great ledges, while at the back there is one story on the top of the ridge. Sometimes this order is reversed, and the stories lessen toward the front. The houses fa-

HOUSES OF THE SEA KINGS.

cing "the Common"—homes of the old sea kings and Bilboa traders, more than a century old—are the best illustration of this method. The cross streets dodge the minor ledges, as the main streets follow the major ones. The result is certainly confusing to the foreigner, but it is certainly more satisfactory to the eye than the gridiron plan on which our smart new towns are commonly laid out. The distribution of the houses is a far greater wonder than the sinuosity of the streets. They remind one of a good-natured crowd of Irishmen upon St. Patrick's Day, when every man is facetiously planting his elbow under his neighbor's fifth rib, or in the pit of his stomach. The newer portions of the town are much more regular. The condition of the older portions can not be accounted for without resorting in some cases to the hypothesis of "pure cussedness." The windings of the streets and the ubiquitous ledges account for it only in part. These circumstances doubtless set the fashion, which, once set, like every other fashion, was carried to the extreme. Whatever the cause, the effect is vastly comical. The theory of an earthquake, which shuffled a once orderly array into the present jumble of delicious incongruities, might be maintained successfully were it not that the town records make no mention of it, and the oldest inhabitants have no tradition of it in their repertory of departed days. The appearance of the town is changing rapidly. It is growing smarter-looking and more commonplace. Not only are great shoe manufactories crowding about the handsome railroad station, and ambitious dwelling-houses dotting the suburbs, but the old houses are un-

LEE STREET.

dergoing a continual process of repair. Many innocent of paint for many a score of years are tasting for the first time that long-forbidden fruit of competence and self-respect. Thirty years ago the town abounded in various old houses, still inhabited, with many a broken window-pane stuffed with old hats or petticoats. The most of these have disappeared; but many are still left in tolerable repair, all weather-browned and blackened and overgrown with "dainty mosses, lichens gray." In 1820, I am told, hardly a dozen houses in the town were painted, and ruin was the average condition, the broken window-panes outnumbering the whole ones. This was when the town was still lying prostrate after the war of 1812. Now there is growing pride and almost universal neatness, with a good deal of taste, best shown in the gay little flower gardens that every where assimilate the rich juices of the soil, and convert them into the most brilliant coloring. Happy the man who is allowed to penetrate beyond these outer courts into the inner sanctuaries, into the snug sitting-rooms and the polished kitchens and the "chaney closets" of incomparable neatness and niceness. Here are to be seen heir-looms from a remote antiquity, cups and saucers out of which great-grandmothers drank forbidden tea in old colonial days, famous old desks and chests of drawers and high clocks, that "make the judicious grieve," because they are not to be bought with money.

There are a great many houses scattered through the town that are impressive monuments of the departed days of mercantile prosperity. Now there is prosperity again, and it is building its monuments, and some of them are certainly handsomer than the old ones, but they are very uninteresting in comparison with the houses that have tasted the salt air of the old town for two and three half centuries. There are scores of houses that date back as far as this, and many of them are houses that have a history, that have associations. Great and good men have lived and died in them, and their ancient walls and timbers seem to exhale the fragrance of their piety and courage. Here is the house which Parson Barnard built in 1720, or before. Here is the old "glebe" of the Episcopal church, nearly or quite as old. Here is the house where Elbridge Gerry was born, and the houses where his compatriots, Colonel Orne and General Glover, plotted against oppression. The birth-place of Judge Story is not far away, and exactly opposite is the house where Parson Holyoke lived, and where his son, Dr. Holyoke, who lived to be a fine old centenarian, was born. The parson himself left his Marblehead pulpit in 1737 to take the presidency of Harvard College. The people voted to not let him go; but the college pleaded hard, and so the people had another meeting, and called in

Parson Barnard, of the First Church, to pray with them. The result was favorable to the college. "Old Barnard prayed him away," was some one's brief account of the transaction. Some of the *noti homines* have got into the fine last-century houses. But this, perhaps, is quite as it should be. The old Lee mansion-house, the finest of all, is now used for banks and offices. This is not nearly so old as many others, but it is far more capacious and more tasteful than any of its fellows. It was built in 1758 by Colonel Jeremiah Lee, and as long as it remained in the family it was graced with full-length portraits of the colonel and his wife, painted by splendor-loving Copley, in the handsome costume of the period. The original cost of the building is said to have been £10,000 sterling. There were plenty of slaves to keep its oak and brass well polished. Its great hall was wider than our city lots, its staircase in proportion. Here Washington was received by Colonel William Lee, whom he had promoted for distinguished bravery at Trenton and Princeton; here Lafayette was made "a spectacle for men and angels" on the occasion of his second visit to America. Should another hero come to town, where would he be received? But the danger is not imminent.

In one of the queerest corners of the town, called "Oakum Bay," there stands a house as modest as the Lee house was magnificent. So long as he lived it was the home of "Old Flood Oirson," whose name and fame have gone farther and fared worse than any other fact or fancy connected with his native town. Plain honest folk don't know about poetic license, and I have often heard the poet's conduct in the matter of Skipper Ireson's ride characterized with profane severity. He unwittingly departed from the truth in various particulars. The wreck did not, as the ballad recites, contain any of "his own towns-people." Moreover, the most of those it did contain were saved by a whale-boat from Provincetown. It was off Cape Cod, and not in Chaleurs Bay, that the wreck was deserted, and the desertion was in this wise: It was in the night that the wreck was discovered. In the darkness and the heavy sea it was impossible to give assistance. When the skipper went below he ordered the watch to lie by the wreck till "dorning," but the watch willfully disobeyed, and afterward, to shield themselves, laid all the blame upon the skipper. Then came the tarring and feathering. The women, whose rôle in the ballad is so striking, had nothing to do with it. The vehicle was not a cart, but a dory; and the skipper, instead of being contrite, said, "I thank you for your ride." I asked one of the skipper's contemporaries what the effect was on the skipper. "Cowed him to death," said he—"cowed him to death." He went skipper

IRESON'S HOUSE, OAKUM BAY.

again the next year, but never afterward. He had been dead only a year or two when Whittier's ballad appeared. His real name was not Floyd, as Whittier supposes, but Benjamin, "Flood" being no corruption, but one of those nicknames that were not the exception, but the rule, in the old fishing days. For many years before his death the old man earned a precarious living by dory-fishing in the bay, and selling his daily catch from a wheelbarrow. When old age and blindness overtook him, and his last trip was made, his dory was hauled up into the lane before his house, and there went to rot and ruin. This solitary dory-fishing is the last resort of many an ancient fisherman. A few days ago I found one of these in his eighty-fifth year splitting up his dory for fire-wood. It was a sad job for him. He had followed the sea for seventy-seven years. He could still row and fish, he said, as well as ever, but his sight was getting dim.

One of the most persistent superstitions of the town attaches to the vicinity of Skipper Ireson's dwelling. Time was when hundreds of people were ready to aver that they had heard in this vicinity the Screeching Woman's doleful and heart-breaking cry. The story was that once upon a time a pirate crew had landed at the cove, bringing a woman with them. For one hundred and fifty years, on the anniversary of her outrageous death, at dead of night, her cries for help could be distinctly heard. But while this, with many kindred superstitions, was the staple of the old wives' evening talk, and sent a curdling horror through the young

folks' veins, it is remarkable that the witchcraft delusion which made such havoc only four miles away was here quite innocuous. One Marblehead woman was accused before the Salem courts, and suffered death for reasons too absurdly gross for ears or eyes polite.

The hoarse refrain of Whittier's ballad is the best-known example of the once famous Marblehead dialect, and it is not a bad one. To what extent this dialect was peculiar to Marblehead it might be difficult to determine. Largely, no doubt, it was inherited from English ancestors. Its principal delight consisted in pronouncing *o* for *a*, and *a* for *o*. For example, if an old-fashioned Marbleheader wished to say "he was born in a barn," he would say, "I was barn in a born." The *e* also was turned into *a*, and even into *o*, and the *v* into *w*. "That vessel's stern" became "that wessel's starn," or "storn." I remember a school-boy declaiming from Shakspeare, "Thou little walliant, great in willainy." There was a great deal of shortening. The fine name Crowninshield became Grounseel, and Florence became Flurry, and a Frenchman named Blancpied found himself changing into Blumpy. Endings in *une* and *ing* were alike changed into *in*. Misfortune was misfartin, and fishing was always fishin. There were words peculiar to the place. One of these was *planchment* for ceiling. Crim was another, meaning to shudder with cold, and there was an adjective, *crimmy*. Still another was *clitch*, meaning to stick badly, surely an onomatopoeic word that should be naturalized before it is too

late. Some of the swearing, too, was neither by the throne nor footstool, such as "Dahst my eyes!" and "Godfrey darmints." The ancient dialect in all its purity is now seldom used. It crops out here and there sometimes where least expected, and occasionally one meets with some old veteran whose speech has lost none of the ancient savor.

A few years ago "the dismantled fort" which figures in Longfellow's *Fire of Driftwood* was the principal object of interest to the stranger. It was indeed a fine old ruin, a famous place for lovers, when the sea was lapping softly on the crags, and the moon was making a great pathway for their hopes, and the light-house opposite a little pathway for their fears, and the white sails of the boats went dancing across these pathways out of and into the darkness. The fort was called Fort Sewall, after Chief Justice Sewall, one of the great men of the town, a grandson of the first Chief Justice Sewall, of whom

"Touching and sad a tale is told,
Like a penitent hymn of the Psalmist old,
Of the fast which the good man life-long kept,
With a haunting sorrow that never slept,"

because he, then a junior judge, had given judgment against the Salem witches. A letter of the grandson, written in 1780, is one of the most interesting side lights of the Revolution. It describes a sad state of affairs, mainly owing to a severe winter and a great scarcity of wood. The poor went about begging and stealing it; the rich had to burn their meaner furniture. Sewall, then a young lawyer, tells how he had to warm himself at his neighbors' fires and among their pots and kettles. Seeing that not long after he married one of the wealthier daughters of the place, it may be inferred that he warmed himself at her fire-side oftener than at any other. Fort Sewall's greatest day was the 3d of April, 1814. Then it really did good service, for then the *Constitution*, chased by the frigates *Tenedos* and *Endymion*, ran in to the protection of its guns. It was Sunday, but the Sabbath peace was sadly broken. Heavy cannon were sent over from Salem, the battalion of artillery in the town made ready, from the Charlestown Navy-yard assistance came post-haste, and the New England guards in Boston marched to the rescue of the brave old ship. But the *Tenedos* and *Endymion* made off to sea again without waiting to be peppered. During the late war the old fort was made over, so that now it is wholly without interest.

"Little Harbor" lies back of the fort, with a little island, Gerry's, at its mouth. On this island the first regularly ordained minister of Marblehead built him a house, and the pavement of his door-yard is still visible, and a shanty stands upon the cellar that he dug two centuries ago. The Fountain Inn was on the main-land a few rods from

THE POWDER-HOUSE, 1755.

the sea-girt parsonage, so safe from interruption at high tide, when, let us trust, the sermon was habitually written. The Fountain Inn was the first inn in the place, and a romantic interest attaches to its history. A few years ago a well belonging to it was accidentally discovered in digging a post-hole. It had been filled up, but its walls were as good as ever. It was cleared out, and is now in use again. Sweet Agnes Surriage must have drawn many a bucket of water from this well, and Sir Harry Frankland's horses must have taken a long pull at its nectar before they started off again for Boston. Dr. Holmes has made the fortunes of these two the subject of his ballad *Agnes*, but the ballad is far less interesting and poetical than the unvarnished tale as told by the learned antiquary, Mr. Elias Nason, in a charming monograph. Sir Harry was a lineal descendant of Oliver Cromwell. In 1741 he was made Collector of the Port of Boston. The next year he went to Marblehead, presumably to oversee the first erection of the fort. Stopping at the Fountain Inn, he found a lovely girl engaged in scrubbing down the steps, doubtless anent his coming.

"Bent o'er the steps, with lowliest mien,
She knelt, but not to pray;
Her little hands must keep them clean,
And wash their stains away."

Shoeless and stockingless, her feet showed all the prettier. Her face was found to match. And so it happened that Frankland gave her a crown to buy shoes with, and not being able to forget her, came again,

"OLD NORTH" CONGREGATIONAL CHURCH.

and found her as before. "I keep them to wear to meeting," said she of her new shoes. This time, when Sir Harry went back to Boston, he took Agnes with him, avowedly to educate her, but with ulterior purposes soon carried out. The Boston of 1750 was not the Boston of a century before, but still it could not tolerate such open sin, and Sir Harry was driven by the social chill into a warmer atmosphere. He built at Hopkinton a stately mansion, and carried Agnes thither. Her lowly birth was not the sign of any natural inferiority, and her fine powers expanded rapidly in a congenial atmosphere, and her heart, supremely devoted to Sir Harry, went out in love and tenderness to all her household and acquaintances. Music and flowers were her two great delights, and Richardson's affecting stories often soothed her loneliness when business in the city took her lord away. In 1754 Sir Harry went abroad, and took her with him. His mother and his noble kindred generally gave her a very cold reception. They went to Lisbon, and were there when the great earthquake overwhelmed the city. When the tumult had subsided Agnes went out in

the elms the lovers planted are now twelve feet in circumference, and the box is ten feet high.

"Thus Agnes won her noble name,
Her lawless lover's hand;
The lowly maiden so became
A lady in the land."

Back of the spot where stood the Fountain Inn rises a rocky hill, and back of this another, upon which once stood the first meeting-house built in the town. No church since built has occupied so fine a site, affording as it does a view of all the coast from Boston to Cape Ann, and of the immeasurable sea. The old building underwent many changes as the town increased in size, and all these were duly recorded, and can be read to-day in the town records, which are in a state of perfect preservation. One can hear in those records the rattle of the window-panes, which were fastened with nails, without putty, and the nails, it seems, were always coming out. Laths and plaster were things unknown. A century later "King Hooper," a famous merchant and aristocrat of Marblehead, had a country-seat in Danvers, and he there made some generous gift

search of Sir Harry, who had been overtaken in the streets. At last she found him, buried under heaps of stones, but still alive. She succeeded in getting help to extricate him, her own superhuman efforts having been in vain; and he, deeply affected by these proofs of her devotion, made her his lawful wife. They were first married by a Romish priest, but on the passage to England assurance was made doubly sure by a Protestant remarriage. Lady Frankland relented when she heard the story of that dreadful day. Then came a dozen years of perfect happiness, interrupted by Sir Harry's death in 1768. Lady Agnes went to England when the rupture came between the colonies and the mother country. The old mansion-house was burned only a few years ago, but

to the Episcopal church; whereupon, in token of gratitude, the vestrymen voted to lath and plaster a spot in the ceiling directly over his pew, and just the size of it. The improvement to the ancient house in Marblehead which leaves upon the records the most shining trace was the introduction of a second gallery. So strikingly did this "thing of beauty" confirm the truth of Keats's famous line that, ten years after its completion, it was voted in town meeting "that Robert Knight should be released from paying his town rates during his lifetime for his workmanship done in the meeting-house in building the galleries." This building was at length removed to a more sheltered spot, and, with still further improvements, it lasted until 1824 for religious purposes, and a year longer for the storing of fish. The society that left it built what is now known as the "Stone Church," or "Old North." Its front is of granite; its sides and back are from the ledge on which it stands. The worshipers can sit in their pews and see the rock from which these were hewn and the pit from which they were digged rising high up against the windows. One venerable church is still standing, St. Michael's, built in 1714. It has suffered somewhat from repairs, but is still a singularly quaint and interesting bit of antiquity. The second rector of this church, Rev. David Mossom, removing to Virginia, there had the distinguished honor of marrying Mr. George Washington to Mrs. Martha

Custis. Another venerable building is the Town-house, built in 1728 "on the spot where the gaol and cage now stand," so reads the vote for the appropriation. The powder-house is also venerable.

The ecclesiastical history of the town had a most pathetic beginning. August 15, 1635, there was such a storm on the New England coast as has not since been paralleled. We have various accounts of it. One by Governor Winthrop, who says that there were "two flood tides within two hours of each other;" one by Richard Mather, the first of all the Mathers, of New England fame and shame. He was caught in it at the Isles of Shoals, where, from Smutty Nose Island, a house belonging to a tailor, named Tucker, was washed away and carried entire to Cape Cod, where it was hauled ashore, and a box of linen and some papers made known where it was launched. But by far the most affecting account of the storm is that of Anthony Thatcher, also a tailor, who with his cousin, Rev. John Avery, had started from Ipswich a few days before. Avery was bound for Marblehead, where he had been invited to come and preach the Gospel. His wife and eleven children were with him, Thatcher's wife and seven children, a Mr. Elliot, and four sailors. All of these were lost but Thatcher and his wife. Thatcher's account of the disaster is too fine to be abridged, but too long for our present limits. Whittier has retold the story in one of his rarest poems. The poor tailor named

TUCKER'S WHARF—THE STEPS.

"THERE ON THE HIGHEST POINT IS A SIMPLE MONUMENT."

the rock on which the shallop struck, Avery's Fall, and the island near by, Thatcher's Woe, and they are still called Avery's Rock and Thatcher's Island.

"There was wailing on the main-land
From the rocks of Marblehead;
In the stricken church at Newbury
The notes of prayer were read;
And long by board and hearth-stone
The living mourned the dead."

Of all the ministers who have preached in Marblehead from the beginning the Rev. John Barnard doubtless did the greatest work, and was the man of strongest character. Until he came to the town there had been but one church; but the congregation were divided between him and the Rev. Edward Holyoke. Barnard had the majority of votes, but refused to settle unless Holyoke could come and take his friends and form another society. This was agreed upon, and carried out in 1715. In 1737 Barnard was informally invited to take the presidency of Harvard College, but feeling certain that Holyoke was the fitter man, he so advised the overseers and corporation, and his advice was taken. It is a significant fact that the town had at this time two men held to be worthy of so great an honor. In his old age Barnard wrote an autobiography, and sent the manuscript to President Stiles, of Yale College, the universal correspondent of those times, the most ubiquitous of men, forever turning up in the history of his generation. It is spiced with a considerable amount of egotism, but it is a document of inestimable value and abounding interest. The most amusing item is that for ten weeks he preached upon one leg, the other being affected with sciatica. Parson Barnard, like the famous Hugh Peters and many other preachers of

that time, was more than a preacher. He was a man of public spirit. He was a social regenerator. When he came to Marblehead there was not one foreign trading vessel in the port. "Nor could I find," says the autobiography, "twenty families that could stand on their own legs; and they were generally as rude, swearing, drunken, and fighting a crew as they were poor. I soon saw the town had a price in its hands, and it was a pity they had not the heart to improve it." He at last succeeded in stirring up a young man, Joseph Swett, to engage in foreign trade, though his first venture was only to Barbadoes. From this time the town began to export its own fish. In 1740 the town had 150 vessels engaged in fishing, and at least a third as many more in carrying them to Bilboa and other Spanish ports. The town became second in population and wealth to Boston, and when the days of trial came, its port of entry and its freest benefactor. The Revolution, the French and English wars, and the war of 1812, with the embargo that preceded it, put an effectual stop to this astonishing prosperity. To-day only a few of the men who were a part of it remain. When you find one of them you find a treasure. He has his castles in Spain, and he will talk about them by the hour as he sits sunning himself and warming his thin blood on the wharves, which, now almost deserted, he remembers when they bustled with activity. He is nearly ninety years old. He saw Lafayette and Washington when they came to town. He saw General Glover in his coffin. He has talked with Elbridge Gerry's freedman Cato, his slave before the Revolution. He was a privateersman in the war of 1812, and one of the five hundred men of Marblehead who were in Dartmoor prison at the

end of that war. He has a lively recollection of that April day when the prisoners there were fired upon. He has seen the armies of Napoleon and Wellington on the Peninsula, and he is not so old but that his eye will sparkle when he tells you of the beauty and the tenderness of the girls of Spain and Portugal. An egg is not so full of meat as he is full of tales of storm and wreck and merciful deliverance. But his name is not legion, and the places that have known him will soon know him no more.
Post tot naufragia portus.

A successor of Parson Barnard, of a less practical turn, was wont to pray for those "who go down to the sea in ships, and who do business on great waters," "may they be blessed with a perpetual calm." I fancy that without the Scriptural part of this petition no prayer was considered perfect in the good old times. Certainly it was never omitted from any prayer that I overheard from Parson Bartlett's lips when that good man was the instructor of my youth. But the prayer for a perpetual calm is now receiving a late answer. It settled down

upon the foreign traffic long ago, and now it is settling down upon the fishing. When Whitefield came to Marblehead he asked, "Where do they bury their dead?" because it was so rocky. They buried them on what is now "The Old Hill," and was originally the church-yard of the First Church, one of the rockiest hills in the whole town. There the old Puritan ministers lie buried under resounding Latin epitaphs; there the red wild roses bloom their reddest and the golden-rod its yellowest; and there on the highest point is a simple monument in memory of those lost in the gale of '46—a dozen vessels, sixty-six men and boys. To-day the Bank fishing vessels, all told, only number eighteen, and on board of these there are not a score of Marblehead men. The rest are mainly from the Provinces. Once the fish fences covered every seaward hill and many an inland one; now a few acres contain all that remain of them. For hundreds of warehouses where the fish were stored, there remain perhaps a dozen. These changes have been gradual. Little by little St. Peter's followers have become followers of St. Cris-

"WHEN I WAS WITH SNOW, IN THE 'BRILLIANT.'"

"SITTING, STITCHING IN A MOURNFUL MUSE."

pin. Twenty years ago there was a new departure. The town had its ship-yard, and four or five large ships were built, and thrice as many schooners. Those were happy days for the old veterans. They thought that verily the Saturnian days had come again. But their hilarity was brief. A deeper melancholy soon possessed their generous hearts.

And now that that old life is almost ended, it is lived over and over again in happy recollection by those who once were fairly steeped in it. Events that at the time had little pleasure in them are very pleasant to recall, as Virgil long ago suggested. A few years ago the town was sprinkled thick with little shoe shops, about twelve feet square, in which six or eight men could work. There were hundreds of these little shops. They offered great facilities for conversation, though when all were hammering at once, the voices were pitched very high. But the shoe business itself has undergone a revolution. Few of these little shops are now occupied. Dozens of them are in a melancholy process of decay. The invention of labor-saving machinery has crowded the men into large manufactories, which are not favorable for conversation of the sort we have in mind. That needs enough partakers, and no more, to insure a generous rivalry, and to cap every climax with a more exciting story. The present scene of this is the back shop of the little grocery. This back shop is an abounding and delightful institution. It must be seen in winter-time if

one would see it to advantage. Then, when the floor is full of pea-nut shells and the air is thick with smoke, and the salamander is red-hot and sizzling with occasional ejections of tobacco juice, the little circle rises to the height of the occasion. Sometimes all talk at once. "When I was with Snow, in the *Brilliant*," one begins; but some heavier engine throws him off the track. He soon gets on again, and begins afresh his story in a higher key, only to be again suppressed. They have all heard it scores and scores of times. He goes off with a snort, and the rest go on spinning

their yarns. Some of them have lost nothing by a hundred repetitions. If the pleasure is more in the telling than in the hearing, it is still about equally distributed. The colloquy tends rapidly to become soliloquy where one monopolizes all the talk.

Marblehead has never kept a poet, though Whittier and Longfellow and Holmes and Lucy Larcom, here the noblest singer of them all, have celebrated real or imaginary things and persons and events connected with the dear old town. If Lucy Larcom had written nothing but her *Hannah Binding Shoes*, she would have an enviable fame. I have fancied that I know the very woman who suggested that affecting ballad,

"Sitting, stitching in a mournful muse."

But there is material enough for poetry in the scenes and habits of the fast-receding time, when all the energy of the community was concentrated upon "the art preservative of all arts," if it be true that fish makes phosphorus and phosphorus makes brains. There was the bustle of preparation, the getting in of wood and salt and stores. The schooner generally went to Boston for her salt, and then we youngsters had a fine time of it, going with her to "the dim rich city," and sleeping in the cabin or the "forekistie," and making friends with the cook. Or was it better when a great ship came to Marblehead with a whole load of salt, and we were permitted to go on board of her, and to row at night under her bows and feel their awful

shadow, and wonder if her stern went down till it touched the heart of the world? Then there were the home preparations, the washing and mending of the great pea-jackets and trousers that smelled so of the sea, the packing of the chest, the making of "Harrison cake" and hard gingerbread. When the day came for sailing it was a very silent morning in the house. There was no talk at breakfast-time. The handsome thing for the skipper to do was to sail round the harbor an hour or two with the company that had collected on board, with a long string of "Moses boats" and dories dragging at the stern. Sometimes there was a treat all round from a certain little keg, which the more prudent skippers regarded with unmixed aversion. When at length the skipper shouted, "All ashore!" the last boats were always loaded to the gunnel. Then we went up on "Bartol's Head," and watched the white sails lessen more and more, till they made only a little gleam on the horizon. From that time the "Spoken" in the newspapers was narrowly watched, but with little satisfaction, until the first of the fleet returned, bringing news of nearly all the rest, and how many thousand fish they had on such a day. They used to count thousands, but now they guess quintals. It was a great day when some good neighbor came to the door or window, saying, "Mrs. —, your husband's coming up the harbor." Sometimes there was a rich brown face in the doorway without a word of warning; sometimes a well-known step in the night upon the gravel. There was one coming back that was different from all others within the memory of the present generation. It was after the September gale of '46. After the first news of the disaster had been brought to town there were many weeks of terrible anxiety, of alternate hope and fear. From every headland, and from the "Old North" steeple, eyes were straining into the distance to catch the first hint of a returning sail. And when one was descried, the word went from house to house all through the town, and hundreds crowded to the wharf to see what vessel it might be, and what news it brought of kindred or of friends. Only the fishermen's wives staid very quietly at home, waiting for the sign of hope or widowhood. Sometimes bad news was contradicted, and "women received their dead raised to life again, and others were tortured, not accepting deliverance." I well remember one of these returns. The wharf was packed with an expectant crowd of men and women. As the vessel came up the harbor there was none of the usual hilarity. There were no cheery shouts and answers. There was no talk about "how deep" she was, no brag that she had "wet her salt." When the crew landed, the crowd parted silently to let them through. There was hardly a word spoken. The crowd broke

up as the crew separated, and followed them to their various homes. I remember walking home with my hand held in the skipper's very tight indeed, his monstrous fishing boots clumping along with what then seemed to me a very solemn sound. For myself, I was not superior to a feeling of gratification at being escorted home by so many people, though I was but a fly upon the wheel. Then followed such a day. The house was thronged with people anxiously inquiring for their friends. Children came to hear that they were fatherless, and wives to learn that they were widows. And little by little the story of the storm was told, and the story of what followed, when the sea was strewn with proofs of terrible disaster, with wood and spars and seamen's chests and bedding. In one place the masts of two vessels were found hopelessly entangled; in another a vessel lying on her beam ends, and with every mighty surge lifting her masts high up out of the melancholy waste, and then plunging them down again in a sad, hopeless way that almost broke the hearts of those who witnessed it. To a stranger in the town the monument on the "Old Hill" means little, but no monument that I have ever seen is so vocal for me with

"The still sad music of humanity."

But when the voyage had been prosperous, and there had been no general disaster to overcloud its good success, the return was quite a little jubilee. How delicately were the gradations of kinship and acquaintanceship expressed by the different gifts which the happy children were deputed to carry round! The outer circle received only "sea-crackers," that is, crackers left over from those carried, and impregnated with the briny flavor of the sea. The next circle inward received with the crackers a bit of smoked halibut; and those still more favored, in addition to the crackers and halibut, some "tongues and sounds." To all these luxuries, for the inner circle a halibut's fin was added; and the crowning point of goodwill was a "hagdon"—a sea-bird of too rank a savor to be universally enjoyed. The days for washing out were also great days for the children. The fish are now washed in a pound, which is chained against the schooner's side, then carried in dories to the beach, where the tip-carts are backed down into the water to receive them. Even now the scene is picturesque enough; but it was much more so when the washing out was done upon the beach. The fish were dumped into the water, and the men, with their "ile-skins on" and fishing boots, dashed them together, whitening the water with a more decided pickle than the average brine of the sea. On these occasions to carry dinner was esteemed a high prerogative. The dinner was contained in two tin pails, polished as nev-

UNLOADING FISH.

er door-plate was upon Fifth Avenue. One of these was full of tea; the other, with a knife and fork neatly tied to the handle, of meat and vegetables. And with what interest we youngsters watched these dainties disappear, and what nectar and ambrosia seemed the portions given to us in answer to our dog-like looks of pleading! Once there were more than fifty fish fences scattered along the shore. Now there are only two. Long may these two remain, with all their old belongings, that appeal so pleasantly to eye and nose! Here is no such disgusting odor as that which haunts the fishing houses of the Bay fishermen at Swampscot Beach, but a smell so strong and sweet that it is positively agreeable, especially if old associations mingle their fragrance with it. And pleasant it is to see the curing-men, who have caught many a quintal in their day, moving about in the long aisles between the fences, spreading or heaping up the fish, and bearing them away in their barrows to the old warehouses, that are scored all over with the tallies of fish that long ago made brains for poets and philosophers.

The methods of the fishermen have changed as well as their numbers. Twenty-five years ago all the Bank fish were caught on board the schooners. Next, huge dories were carried, in which the men rowed out in various directions, so that if the fish were not found in one place, they might be in another. Now trawls are employed at great cost, and involving harder work than ever. These

changes have brought in a different form of tragedy from any formerly experienced. The men are sometimes caught out in the fog, and do not get back again for days. This very summer (1873) two were caught out in this way, and when picked up at length by a Gloucester schooner, they were fearfully exhausted. For a week they had had nothing to eat or drink. One, in the madness of his thirst, had drunk salt-water, and so increased his thirst and brought on delirium. Verily

"Stone walls do not a prison make,
Nor iron bars a cage."

Here there is possible a form of "solitary confinement" worse a thousand times than that of the prisoner at Sing Sing.

The history of Marblehead is yet to be written. The materials for it are abundant, and they have been patiently culled by a citizen of the place, who is a lineal descendant of Gerry's coadjutor, Colonel Azor Orne, of Revolutionary fame. If ever the results of his researches are made public, they will show that the old town has a history second in interest to no other of its size in the United States. In the town records the line of progress can be traced from the time when a few Naumkeag Indians lived here among rocks and swamps and forests to the time when the annual expenses of the town, including the minister's salary, were £250, and from that time till now, when the annual expenses are \$70,000. From first to last there have been a great many changes. The rocks most-

ly remain. But the swamps have been converted into fertile farms and gardens, and the forests long ago were built into ships and houses, or went to soften the stern rigors of an inclement coast. The town was originally part of Salem, or Salem was a part of it, for it was Marblehead that gave the name to the whole settlement. "Here is plentie of Marblestone," wrote Francis Higginson in 1629, "in such store that we have great rocks of it, and a harbour near by. Our plantation is from thence called Marble-harbour." This name was soon changed to Salem, but the old name was retained for the portion since called Marblehead till 1633, when its present name was generally agreed upon. There was no separate incorporation, however, till 1648, and for a long time after that Marblehead remained in ecclesiastical leading-strings, and though there was preaching at home, the worshipers had to go to Salem for their sacramental bread and wine, for baptism and marriage. The first settlers at Salem were a forlorn hope that followed brave old Roger Conant after the breaking up of the settlement at Cape Ann in 1626, and doubtless Marblehead had settlers from this time. The first mentioned inhabitant was Thomas Gray, who had bought Nantasket from the Indians in 1622. Thomas had evidently offended, for it was decreed by the General Court in 1631 "that his house at Marblehead be pulled down, and that no Englishman shall hereafter give house-room to him." But the man whose name on "Found-

ers'-day," if the town ever has one, will demand the highest honor is Isaac Allerton, one of the *Mayflower* pilgrims, the intimate associate of Carver and Brewster and Bradford and Winslow. His name immediately followed theirs on the famous compact signed in the *Mayflower* cabin. According to Governor Bradford's journal, "Good-wife Allerton was delivered of a son, but dead born," on the 22d of December, 1620, O. S.—a sad beginning for the settlement, for this was the first comer. Allerton was the first assistant governor, and the only one for several years. He it was who, with the redoubtable Miles Standish, "went venturously" to treat with Massasoit. Point Allerton, the first headland of Nantasket, bears his name. For a second wife he married Elder Brewster's daughter Fear. When Winthrop and his party came in 1630, the first face they saw was Allerton's, who boarded them from his shallop. He had the best head for business of any man at Plymouth, and made five voyages to England in the interest of the colony before 1631, when, falling out with his old friends, he came to Marblehead in the *White Angel*, and in the same vessel, loaded with fish, he soon after went to England again. Returning, he made Marblehead his home, building there a large fishing house, and employing many vessels. His son-in-law, Maverick, co-operated with him, and, after him, was the most conspicuous early settler. This Maverick was a good friend of the Indians—gave thirty of them

DRYING FISH, LITTLE HARBOR.

THE TOWN-HOUSE.

"Christian burial" in one day, when the small-pox was sweeping off their feeble remnant. It was Allerton who sent to Ipswich for Parson Avery the ill-fated shallop. Apparently he was the most stirring person in the vicinity of Massachusetts Bay. But as he had fallen out with the Plymouth colony, he now fell out with Winthrop's General Court, which gave him "leave to depart from Marblehead." Afterward, in New Haven and at New Amsterdam, he heaped coals of fire upon his Massachusetts enemies, by proving very serviceable to them in many ways. His only monument in Marblehead is Allerton Block, the finest building in the town for business purposes. But when it was built, a few years ago, the name was Greek to almost every body.

The impulse which Allerton had given was seconded by others, so much so that the third vessel built in New England was built here in 1636, the *Desire*, of 120 tons burden. Alas for her good fame, a part of her first cargo from the West Indies was the first slaves introduced into the New England colonies. All foreign trade was soon abandoned, and early in the next century fishing was the only business of the place. There was not even a carpenter belonging to the town. Parson Barnard reformed this altogether, and for fifty years before the Revolution there was a large export and import trade, and gold is said to have been as plenty as copper had been before. This was the period when nearly all the fine old houses in the town were built, and in which the town acquired the immense influence it evidently had in the events preparatory to the Revo-

lutionary war, and during that momentous struggle.

The ancient records contain a great deal that is laughable at this remove, though it was solemn as eternity at the time. There was the case of John Gatchell, who in 1637 was fined ten shillings for building on the town lands; but it was agreed to abate one-half the fine "in case he should cutt off his long har off his head." There was a regulation size for dogs, above which they could not be tolerated. When the small-pox appeared in town, all under as well as all over

this size were put to death, lest they should carry the contagion. In 1676 no person was allowed to settle in the town who could not give bonds that he would not become a pauper. The original settlers contended jealously for their prerogatives, and were much like the old farmer who wanted all the land adjoining his. When the first load of salt arrived in Marblehead the General Court "sat on it," and voted to send down certain men to unload it, "with power to impress others into their service." The boundaries of land were so indefinite as to become a fruitful source of litigation. "From the bramble-bush on the north, so many feet to the bramble-bush on the west," etc., was no uncommon designation. The province having appropriated five hundred and fifty pounds for the improvement of the fort, it was voted by the town, as a security against embezzlement, "that the trustees deposit the money in one chest with two different locks and keys, the chest to be left in the charge of one and the keys to be held by the others, and the chest not to be opened except in the presence of all three gentlemen." For the honor of human nature be it said, two of the trustees refused to serve on these conditions.

Until the mother country became utterly regardless of the welfare of the colonies the town was noted for its loyalty. When in 1745 Sir William Pepperell wanted men for his expedition, he found the most of them in Marblehead, and when Louisburg surrendered, great was the joy, for the town had been a constant sufferer from the French privateers that found a shelter under the

guns of that fortress. The traditional sentiment of loyalty to the king was cherished long after indignation was aroused at the hard measures of his government. It was insisted, perhaps willfully, that he was not responsible for these measures. But there came a time when this theory was no longer possible for discerning minds. The conviction that he was responsible first found expression at a town-meeting held in Marblehead in a series of resolutions from the hand

of Elbridge Gerry, as were all the resolutions of the period. Many were startled at this, but many months had not passed before the average public sentiment indorsed the manly utterance. There was more than one "cradle of liberty." Those were the days of town-meetings and resolutions and circular letters, and not Faneuil Hall itself resounded with more stirring eloquence or saw more resolute defiance of oppression than the old Town-house in Marblehead, which ought to stand

for centuries to come as the best monument of that heroic time. Colonel Azor Orne was the orator, Gerry was the man of mighty words, employed to draft all letters and resolves. Glover, "the man of war," labored with these; but a better opportunity was awaiting him in no distant future. Sixty merchants of the town agreed to import no tea, and when one of four who had refused to sign the agreement had brought a chest to town, it went out much sooner than it came in, well pasted over with patriotic mottoes, and accompanied by a derisive and indignant crowd. When State Street, Boston, ran with patriot blood, there were fierce echoes of the firing down at Marblehead, but her own sons had bled before, and that shed in State Street was not the first blood of the Revolution. This was shed on board a Marblehead vessel, the brig *Pitt*, Captain Thomas Powers. Returning from Cadiz, she was boarded by a lieutenant and party of seamen from the British war ship *Rose*, with a view to impressing some of her crew. The attempt succeeded, but not without much labor, and the exchange of many rounds, and the death of the lieutenant, who was killed by a harpoon hurled at him by Michael Corbett, who for three hours defended him-

self in the fore-peak. On February 26, 1775, the tragedy of Lexington came very near being anticipated at Marblehead and Salem.

On this day Colonel Leslie landed at Marblehead with from two to five hundred men, and marched to Salem, with a view to seizing there a certain piece of ordnance. There they were prevailed upon to turn back without accomplishing their purpose. As they marched back through Marblehead, the Marble-

GREAT HEAD.

GERRYMANDER.

head regiment was drawn up, a thousand strong, to dispute their passage if they had done any thing amiss. It was in the church at Watertown, in which the Massachusetts General Court assembled, that Elbridge Gerry proposed the first measure of defensive warfare, in the view of John Adams the most important measure of the Revolution. As representative of the town in the first Continental Congress, Gerry's voice was from the first for "independency," and his name stands among the signers of the immortal Declaration. He was perhaps the greatest man of whom the town can boast. Collaborer with Hancock and the Adamses, the bosom friend of Joseph Warren, signer of the Declaration, Governor of Massachusetts, and Vice-President of the United States, his name has been ungraciously embalmed in the word gerrymander, which hundreds use where one knows its origin. Gerry, while Governor of Massachusetts, was charged with remodeling the Essex district for political purposes. A map of the district as remodeled was not unlike some fabulous monster, to which the name gerrymander, suggested perhaps by salamander, was given. And now all remodeling of districts for party purposes is gerrymandering. Surely the unsullied patriotism of Elbridge Gerry did not earn for him any such doubtful honor.

The Revolutionary honors of the town were divided between her own regiment (her own from drummer-boy to colonel) and her privateersmen. John Manly, of Marblehead, and not Paul Jones, was

the first to run up the American flag; and Commodore Tucker, not Paul Jones, again, captured more British vessels, guns, and seamen than any other captain in the service of the thirteen States. It was a mortar captured by John Manly, if John Adams can be trusted as authority, that drove the British out of Boston. With Commodore Tucker Adams had some personal acquaintance. The commodore took him to Europe in 1779. They fell in with an enemy and a fight ensued. Adams promised to retire below, but Tucker soon observed him fighting as a common marine, and ordered him to leave the deck. Adams not doing so, Tucker laid violent hands upon him, exclaiming, as he did so, "I am commanded by the Continental Congress to carry you in safety to Europe, and I will do it." But of all the old town's naval heroes Captain James Muggford earned for himself the briefest glory and the most pathetic fame. He had been impressed on board the British frigate *Lively*, in Marblehead Harbor. His wife went on board the frigate, and stating that they had just been married, demanded his release, which soon after was granted, but not before he had heard the sailors talking about a "powder ship" which they were expecting from England. Resolving to capture her, he

GENERAL GLOVER.

applied for a commission, but sailed, before it came, in a small fishing smack, with a score of men from Glover's regiment, in which he was himself a captain. He captured her in Boston Bay, and carried her into Boston, at a time when Washington's stock of powder did not amount to more than nine rounds per man. A few days later, returning to Marblehead, his little vessel was surrounded by a swarm of barges from the British fleet then lying in Nantasket Roads. The fight was desperate, and Mugford was mortally wounded. But his vessel got away, bearing his lifeless body, which a few days later the marine regiment at Marblehead buried with solemn pomp.

The Twenty-first Provincial, afterward the Fourteenth Continental regiment, was often called the Marine Regiment than by any other name. It was composed entirely of Marblehead men. For two years after the beginning of the war it was commanded by Colonel Glover, and when he was made brigadier-general it was a part of his brigade. It was at first stationed at Beverly, and employed in fitting out the first privateers, whose crews were taken mainly from its ranks. It marched to Cambridge after the battle of Bunker Hill, and was there quartered in the noble mansion now occupied by the poet Longfellow. On the arrival of Washington it was made his head-quarters. One of his first trials was on account of the Marblehead boys, whose laughter was excited by the appearance of the Virginia regiments, and who not only derided them, but snow-balled them. The Virginians were sensitive, and got very mad, and things looked serious when Washington arrived. There were plenty of bickerings and jealousies in the camp at Cambridge, and it is said that Colonel Orne, of Marblehead, was often called upon to address the quarrelsome and discontented, and restore them to a sense of duty. Twice during the war the Marblehead regiment was assigned to a position of first-rate importance, a position that could hardly have been taken by any other regiment. On the 28th of August, 1776, Washington, defeated in battle, having decided to evacuate Long Island, Glover, with the whole of his regiment fit for duty, was summoned to take sole charge of the retreat across East River. There were but few row-boats, and until eleven o'clock the sail-boats were useless, the wind being unfavorable. At that hour, however, it changed, and, what was better, a fog settled over Long Island, and before morning the whole army, 9000 men, with all the field artillery, ammunition, provisions, cattle, horses, carts, etc., were got over. This retreat has always been considered one of the highest proofs of Washington's good generalship. But it is easy to see that it never could have been accomplished if he had not had a regiment of fish-

ermen to call upon. Nor without these could he have gained that victory at Trenton, which gave to our affairs such a new aspect that it was really the beginning of the end. Glover and his men were chosen to transport the army across the swollen Delaware filled with floating ice. The night was so intensely cold that several men were frozen to death. Snow and sleet added to the difficulty of the passage, but when it was accomplished the fishermen led the advance. A captain of the regiment, a son of General Glover, found that the arms had been unfitted for use by the storm. This being made known to Washington, he made answer in three words, "Advance and charge." And so Trenton's famous victory was won. Afterward Glover was stationed at various points in New York, and always did good service. He was one of the court-martial that tried Major André, and was officer of the day that saw his execution.

When the war was over, and Marblehead summed up her losses, it was found that, whereas in 1772 she had twelve thousand tons of shipping and twelve hundred voters, at the close of the war her tonnage was but fifteen hundred and her voters but five hundred, while there were about five hundred widows and one thousand orphans in the place. The fishing business soon revived, but the foreign trade had met with mortal wounds. It revived but partially, and the war of 1812 gave it its absolute quietus. During this war the town was not in sympathy with the prevailing sentiment of New England, which was violently anti-democratic. With more to lose by war than any inland town, her patriotism did not falter, and great was her delight when Gerry, losing the Governorship of the State by the Federalist reaction, was made Vice-President. Nearly one-fifth of her whole population was in the ranks or on board of privateers or regular men-of-war, "Old Ironsides" getting here nearly her whole crew. More than five hundred Marblehead men were in Dartmoor and other English prisons at the end of the war. After the war there came a period of terrible depression. The old people can not yet speak of it without bitterness. Gradually the shoe business came in to eke out the scanty resources of the inhabitants. When the Massachusetts troops were called out at the beginning of the late war the wine stirred in the cask again. The order came late in the afternoon. At eight o'clock the next morning the town's three companies were in Faneuil Hall. No other companies arrived so soon. A part of the Eighth regiment, they started for Washington, expecting to go through Baltimore. At Philadelphia, the story goes, one of the captains *ground his sword*, and the brave fellows wrote their names on bits of paper, and pinned them to their clothing. And now

all that seems as remote as the war of 1812, or even the Revolution.

What will be the future of this quaint old town it would be hard to prophesy. Only one thing is certain, that its coves and headlands will ere long become the spoil of strangers seeking for summer residences. And nowhere can they find more wild and lovely ocean scenery or more invigorating air. Already many handsome cottages have sprung up along the shore. For several years past the Neck has been a favorite place for camping out, more than a thousand people dwelling there in tents and shanties, in rare instances in a truly "aesthetico-economical fashion." But now the

Neck has been laid out in building lots, and most of the nomads have been driven away. Upon the harbor side a score or two of shanties still offend the eye with their unsightliness. But even these "abominations set up in the holy place" can not seriously mar its beauty and picturesqueness. While rocks and sea remain, and clouds and sunlight deck them with a thousand varying colors, there will be solace here for weary brains and hearts, haply made sweeter if with the natural charm there mingles some recollection of the parts which the old town once played in comedies and tragedies, which at the time were full of interest alike to actor and beholder.

"THEIR HANDS TOUCHED."

CHAPTER XLVI.

THE BEDSIDE OF DALTON.

FREDERICK DALTON remained in his prostrate condition, with no apparent change either for the better or for the worse, and thus a month passed.

One morning Dudleigh requested an interview with Edith.

On entering the room he greeted her with his usual deep respect.

"I hope you will excuse me for troubling you, Miss Dalton," he said, "but I wish very much to ask your opinion about your father. He remains, as you know, unchanged, and this inn is not the place for him. The air is close, the place is noisy, and it is impossible for him to have that perfect quiet which

he so greatly needs. Dudleigh Manor is too far away, but there is another place close by. I am aware, Miss Dalton, that Dalton Hall must be odious to you, and therefore I hesitate to ask you to take your father to that place. Yet he ought to go there, and at once. As for yourself, I hope that the new circumstances under which you will live there will make it less unpleasant; and, let me add, for my own part, it shall be my effort to see that you, who have been so deeply wronged, shall be righted—with all and before all. As to myself," he continued, "I would retire, and relieve you of my presence, which can not be otherwise than painful, but there are two reasons why I ought to remain. The first is your father. You yourself are not able to take all the care of him, and there is no other who can share it except myself. Next to yourself, no one can be to him what I am, nor is there any one with whom I would be willing to leave him. He must not be left to a servant. He must be nursed by those who love him. And so I must stay with him wherever he is. In addition to this, however, my presence at Dalton Hall will effectually quell the vulgar clamor, and all the rumors that have been prevailing for the last few months will be silenced."

Dudleigh spoke all this calmly and seriously, but beneath his words there was something in his tone which conveyed a deeper meaning. That tone was more than respectful—it was almost reverential—as though the one to whom he spoke required from him more than mere courtesy. In spite of his outward calm, there was also an emotion in his voice which showed that the calm was assumed, and that beneath it lay something which could not be all concealed. In his eyes, as he fixed them on Edith, there was that same reverential regard, which seemed to speak of devotion and loyalty;

something stronger than admiration, something deeper than sympathy, was expressed from them. And yet it was this that he himself tried to conceal. It was as though this feeling of his burst forth irrepressibly through all concealment, as though the intensity of this feeling made even his calmest words and commonest formulas full of a new and deeper meaning.

In that reverence and profound devotion thus manifest there was nothing which could be otherwise than grateful to Edith. Certainly she could not take offense, for his words and his looks afforded nothing which could by any possibility give rise to that.

For a whole month this man had been before her, a constant attendant on her father, sleeping his few hours in an adjoining chamber, with scarce a thought beyond that prostrate friend. All the country had been searched for the best advice or the best remedies, and nothing had been omitted which untiring affection could suggest. During all this time she had scarce seen him. In the delicacy of his regard for her he had studiously kept out of her way, as though unwilling to allow his presence to give her pain. A moment might occasionally be taken up with a few necessary arrangements as she would enter, but that was all. He patiently waited till she retired before he ventured to come in himself.

No; in that noble face, pale from illness or from sadness, with the traces of sorrow upon it, and the marks of long vigils by the bedside of her father—in that refined face, whose expression spoke only of elevation of soul, and exhibited the perfect type of manly beauty, there was certainly nothing that could excite repugnance, but every thing that might inspire confidence.

Edith saw all this, and remarked it while listening to him; and she thought she had never seen any thing so pure in its loyalty, so profound in its sympathy, and so sweet in its sad grace as that face which was now turned toward her with its eloquent eyes.

She did not say much. A few words signified her assent to the proposal. Dudley said that he would make all the necessary arrangements, and that she should have no trouble whatever. With this he took his departure.

That same evening another visitor came. It was a pale, slender girl, who gave her name as Lucy Ford. She said that she had been sent by Captain Dudley. She heard that Edith had no maid, and wished to get that situation. Edith hesitated for a moment. Could she accept so direct a favor from Dudley, or give him that mark of confidence? Her hesitation was over at once. She could give him that, and she accepted the maid. The next day came a housekeeper and two or three others, all sent by Dudley, all of whom were accepted

by her. For Dudley had found out somehow the need of servants at Dalton Hall, and had taken this way of supplying that prime requisite.

It then remained to move Dalton. He still continued in the same condition, not much changed physically, but in a state of mental torpor, the duration of which no one was able to foretell. Two short stages were required to take him to Dalton Hall. For this a litter was procured, and he was carried all the way. Edith went, with her maid and housekeeper, in a carriage, Dudley on horseback, and the other servants, with the luggage, in various conveyances.

Dalton received no benefit from his journey, but his friends were happy enough that he had received no injury. The medical attendance at Dalton Hall was, as before, the best that could be obtained, and all the care that affection could suggest was lavished upon him.

From what has already been said, it will be seen that in making this migration to Dalton Hall, Dudley was regardful of many things besides the patient. He had made every arrangement for the comfort of the occupants. He had sought out all the domesticities that were necessary to diffuse an air of home over such a large establishment, and had been careful to submit them to Edith for her approval. He had also procured horses and grooms and carriages, and every thing that might conduce to the comfort of life. The old solitude and loneliness were thus terminated. The new housekeeper prevented Edith from feeling any anxiety about domestic concerns, and the servants all showed themselves well trained and perfectly subordinate.

Dalton's room was at the west end of the building. Edith occupied her old apartments. Dudley took that which had belonged to his "double." The housekeeper took the room that had been occupied by Lady Dudley.

Dudley was as devoted as ever to the sick man. He remained at his bedside through the greater part of the nights and through the mornings. In the afternoons he retired as before, and gave place to Edith. When he was there he sometimes had a servant upon whom he could rely, and then, if he felt unusual fatigue, and circumstances were favorable, he was able to snatch a little sleep. He usually went to bed at two in the afternoon, rose at seven, and in that brief sleep, with occasional naps during the morning, obtained enough to last him for the day. With this rest he was satisfied, and needed, or at least sought for, no recreation. During the hours of the morning he was able to attend to those outside duties that required overseeing or direction.

But while he watched in this way over the invalid, he was not a mere watch-

That invalid required, after all, but little at the hands of his nurses, and Dudleigh had much to do.

On his arrival at Dalton Hall he had possessed himself of all the papers that his "double" had left behind him, and these he diligently studied, so as to be able to carry out with the utmost efficiency the purpose that he had in his mind. It was during the long watches of the night that he studied these papers, trying to make out from them the manner of life and the associates of the one who had left them, trying also to arrive at some clew to his mysterious disappearance. This study he could keep up without detriment to his office of attendant, and while watching over the invalid he could carry out his investigations. Sometimes, in the afternoons, after indulging in more frequent naps than usual during the mornings, he was able to go out for a ride about the grounds. He was a first-rate horseman, and Edith noticed his admirable seat as she looked from the windows of her father's room.

Thus time went on.

Gradually Dudleigh and Edith began to occupy a different position toward one another. At the inn their relations were as has been shown. But after their arrival at Dalton Hall there occurred a gradual change.

As Edith came to the room on the first day, Dudleigh waited. On entering she saw his eyes fixed on her with an expression of painful suspense, of earnest, eager inquiry. In that eloquent appealing glance all his soul seemed to beam from his eyes. It was reverent, it was almost humble, yet it looked for some small concession. May I hope? it said. Will you give a thought to me? See, I stand here, and I hang upon your look. Will you turn away from me?

Edith did not repel that mute appeal. There was that in her face which broke down Dudleigh's reserve. He advanced toward her and held out his hand. She did not reject it.

It was but a commonplace thing to do—it was what might have been done before—yet between these two it was far from commonplace. Their hands touched, their eyes met, but neither spoke a word. It was but a light grasp that Dudleigh gave. Reverentially, yet tenderly, he took that hand, not venturing to go beyond what might be accorded to the merest stranger, but contenting himself with that one concession. With that he retired, carrying with him the remembrance of that nearer approach, and the hope of what yet might be.

After that the extreme reserve was broken down. Each day, on meeting, a shake of the hands was accompanied by something more. Between any others these greetings would have been the most natural thing in the world; but here it was different. There was

one subject in which each took the deepest interest, and about which each had something to say. Frederick Dalton's health was precious to each, and each felt anxiety about his condition. This formed a theme about which they might speak.

As Dudleigh waited for Edith, so Edith waited for Dudleigh; and still there were the same questions to be asked and answered. Standing thus together in that sick-room, with one life forming a common bond between them, conversing in low whispers upon one so dear to both, it would have been strange indeed if any thing like want of confidence had remained on either side.

CHAPTER XLVII.

A BETTER UNDERSTANDING.

DUDLEIGH lived on as before, assiduous in his attendance, dividing his time chiefly between nursing and study of the papers already mentioned. He never went out of the grounds on those occasional rides, and if any one in the neighborhood noticed this, the recent sad events might have been considered an excuse. Thus these two were thrown upon one another exclusively. For each there was no other society. As for Edith, Dudleigh had done so much that she felt a natural gratitude; and more than this, there was in her mind a sense of security and of dependence.

Meanwhile Dudleigh's pale face grew paler. His sleep had all along been utterly inadequate, and the incessant confinement had begun to show its effects. He had been accustomed to an open-air life and vigorous exercise. This quiet watching at the bedside of Dalton was more trying to his strength than severe labor could have been.

The change in him was not lost on Edith, and even if gratitude toward him had been wanting, common humanity would have impelled her to speak about it.

One day, as she came in, she was struck by his appearance. His face was ghastly white, and he had been sitting with his head in his hands as she softly entered. In an instant, as he heard her step, he started up, and advanced with a radiant smile, a smile caused by her approach.

"I'm afraid that you are overtasking yourself," said Edith, gently, after the usual greeting. "You are here too much. The confinement is too trying. You must take more rest and exercise."

Dudleigh's face was suffused with a sudden glow of delight.

"It is kind of you to notice it," said he, earnestly, "but I'm sure you are mistaken. I could do far more if necessary. This is my place, and this is my truest occupation."

"For that very reason," said Edith, in

tones that showed more concern than she would have cared to acknowledge—"for that very reason you ought to preserve yourself—for his sake. You confine yourself here too much, and take too little rest. I see that you feel it already."

"I?" said Dudleigh, with a light laugh, whose musical cadence sounded very sweet to Edith, and revealed to her another side of his character very different from that sad and melancholy one which he had thus far shown—"I? Why, you have no idea of my capacity for this sort of thing. Excuse me, Miss Dalton, but it seems absurd to talk of my breaking down under such work as this."

Edith shook her head.

"You show traces of it," said she, in a gentle voice, looking away from him, "which common humanity would compel me to notice. You must not do all the work; I must have part of it."

"You?" exclaimed Dudleigh, with infinite tenderness in his tone. "Do you think that I would allow *you* to spend any more time here than you now do, or that I would spare myself at the expense of *your* health? Never! Aside from the fact that your father is so dear to me, there are considerations for you which would lead me to die at my post rather than allow you to have any more trouble."

There was a fervor in Dudleigh's tones which penetrated to Edith's heart. There was a deep glow in his eyes as he looked at her which Edith did not care to encounter.

"You are of far more importance to Sir Lionel than I am," said she, after a pause which began to be embarrassing. "But what will become of him if—if you are prostrated?"

"I shall not be prostrated," said Dudleigh.

"I think you will if this state of things continues."

"Oh, I don't think there is any prospect of my giving up just yet."

"No. I know your affection for him, and that it would keep you here until—until you could not stay any longer; and it is this which I wish to avoid."

"It is my duty," said Dudleigh. "He is one whom I revere more than any other man, and love as a father. Besides, there are other things that bind me to him—his immeasurable wrongs, his matchless patience—wrongs inflicted by one who is my father; and I, as the son, feel it a holy duty, the holiest of all duties, to stand by that bedside and devote myself to him. He is your father, Miss Dalton, but you have never known him as I have known him—the soul of honor, the stainless gentleman, the ideal of chivalry and loyalty and truth. This he is, and for this he lies there, and my wretched father it is who has done this deed. But that father is a father only in name, and I have long ago transferred a son's love and a son's

duty to that gentle and noble and injured friend."

This outburst of feeling came forth from Dudleigh's inmost heart, and was spoken with a passionate fervor which showed how deeply he felt what he said. Every word thrilled through Edith. Bitter self-reproach at that moment came to her, as she thought of her own relations to her father. What Dudleigh's had been she did not know, but she saw that in him her father had found a son. And what had his daughter been to him? Of that she dared not think. Her heart was wrung with sharp anguish at the memories of the past, while at the same time she felt drawn more closely to Dudleigh, who had thus been to him all that she had failed to be. Had she spoken what she thought, she would have thanked and blessed him for those words. But she did not dare to trust herself to speak of that; rather she tried to restrain herself; and when she spoke, it was with a strong effort at this self-control.

"Well," she said, in a voice which was tremulous in spite of all her efforts, "this shows how dear you must be to him, since he has found such love in you, and so for his sake you must spare yourself. You must not stay here so constantly."

"Who is there to take my place?" asked Dudleigh, quietly.

"I," said Edith.

Dudleigh smiled.

"Do you think," said he, "that I would allow that? Even if I needed more rest, which I do not, do you think that I would take it at your expense—that I would go away, enjoy myself, and leave you to bear the fatigue? No, Miss Dalton; I am not quite so selfish as that."

"But you will let me stay here more than I do," said Edith, earnestly. "I may as well be here as in my own room. Will you not let me have half the care, and occasionally allow you to take rest?"

She spoke timidly and anxiously, as though she was asking some favor. And this was the feeling that she had, for it seemed to her that this man, who had been a son to her father, had more claims on his love, and a truer right here, than she, the unworthy daughter.

Dudleigh smiled upon her with infinite tenderness as he replied:

"Half the care! How could you endure it? You are too delicate for so much. You do too much already, and I am only anxious to relieve you of that. I was going to urge you to give up half of the afternoon, and take it myself."

"Give up half the afternoon?" cried Edith. "Why, I want to do more."

"But that is impossible. You are not strong enough," said Dudleigh. "I fear all the time that you are now overworking your-

self. I would never forgive myself if you received any harm from this."

"Oh, I am very much stronger than you suppose. Besides, nursing is woman's work, and would fatigue me far less than you."

"I can not bear to have you fatigue yourself in any way. You must not—and I would do far more rather than allow you to have any trouble."

"But even if my health should suffer, it would not be of much consequence. So at least let me relieve you of something."

"Your health?" said Dudleigh, looking at her with an earnest glance; "your health? Why, that is every thing. Mine is nothing. Can you suggest such a thing to me as that I should allow any trouble to come to you? Besides, your delicate health already alarms me. You have not yet recovered from your illness. You are not capable of enduring fatigue, and I am always reproaching myself for allowing you to stay here as much as you do. The Dudleighs have done enough. They have brought the father to this," and he pointed mournfully to the bed. "But," he added, in a tremulous voice, "the daughter should at least be saved, and to have harm come to her would be worse than death itself—to me."

Edith was silent for a few moments. Her heart was beating fast. When she spoke, it was with an effort, and in as calm a voice as possible.

"Oh," she said, "I am quite recovered. Indeed, I am as well as ever, and I wish to spend more time here. Will you not let me stay here longer?"

"How can I? The confinement would wear you out."

"It would not be more fatiguing than staying in my own room," persisted Edith.

"I'm afraid there would be very much difference," said Dudleigh. "In your own room you have no particular anxiety, but here you would have the incessant responsibility of a nurse. You would have to watch your father, and every movement would give you concern."

"And this harassing care is what I wish to save you from, and share with you," said Edith, earnestly. "Will you not consent to this?"

"To share it with you?" said Dudleigh, looking at her with unutterable tenderness. "To share it with you?" he repeated. "It would be only too much happiness for me to do so, but not if you are going to overwork yourself."

"But I will not," said Edith. "If I do, I can stop. I only ask to be allowed to come in during the morning, so as to relieve you of some of your work. You will consent, will you not?"

Edith asked him this as though Dudleigh had exclusive right here, and she had none. She could not help feeling as if this was so,

and this feeling arose from those memories which she had of that terrible past, when she ignorantly hurled at that father's heart words that stung like the stings of scorpions. Never could she forgive herself for that, and for this she now humbled herself in this way. Her tone was so pleading that Dudleigh could refuse no longer. With many deprecatory expressions, and many warnings and charges, he at last consented to let her divide the morning attendance with him. She was to come in at eleven o'clock.

This arrangement was at once acted upon. On the following day Edith came to her father's room at eleven. Dudleigh had much to ask her, and much to say to her, about her father's condition. He was afraid that she was not strong enough. He seemed to half repent his agreement. On the other hand, Edith assured him most earnestly that she was strong enough, that she would come here for the future regularly at eleven o'clock, and urged him to take care of his own health, and seek some recreation by riding about the grounds. This Dudleigh promised to do in the afternoon, but just then he seemed in no hurry to go. He lingered on. They talked in low whispers, with their heads close together. They had much to talk about; her health, his health, her father's condition—all these had to be discussed. Thus it was that the last vestiges of mutual reserve began to be broken down.

Day succeeded to day, and Edith always came to her father's room in the morning. At first she always urged Dudleigh to go off and take exercise, but at length she ceased to urge him. For two or three hours every day they saw much of one another, and thus associated under circumstances which enforced the closest intimacy and the strongest mutual sympathy.

CHAPTER XLVIII.

CAPTAIN CRUIKSHANK.

WHILE these things were going on, the world outside was not altogether indifferent to affairs in Dalton Hall. In the village and in the immediate neighborhood rumor had been busy, and at length the vague statements of the public voice began to take shape.

This is what rumor said: Dudleigh is an impostor!

An impostor, it said. For the true Dudleigh, it asserted, was still missing. This was not the real man. The remains found in the well had never been accounted for. Justice had foregone its claims too readily. The act remained, and the blood of the slain called aloud for vengeance.

How such a strange report was first start-

ed no one knew; but there it was, and the Dalton mystery remained as obscure as ever.

Various circumstances contributed to increase the public suspicion. All men saw that Dudleigh was different from this man, or else he had greatly changed. For the former was always outside, in the world, while this man remained secluded and shut up in the Hall. Why did he never show himself? Why did he surround himself with all this secrecy? This was the question.

The servants were eagerly questioned whenever any of them made their appearance in the village, but as they were all new in the place, their testimony was of little value. They could only say that he was devoted to the invalid, and that he called Miss Dalton by that name, and had called her by that name when he engaged them for her service.

Soon public opinion took two different forms, and two parties arose. One of these believed the present Dudleigh to be an impostor; the other, however, maintained that he was the real man, and that the change in his character was to be accounted for on the grounds of the terrible calamities that had resulted from his thoughtlessness, together with his own repentance for the suffering which he had inflicted.

Meanwhile the subject of all this excitement and gossip was living in his own seclusion, quite apart from the outside world. One change, however, had taken place in his life which required immediate action on his part.

A great number of letters had come for "Captain Dudleigh." The receipt of these gave him trouble. They were reminders of various pecuniary obligations which had been contracted some time previously. They were, in short—duns. He had been at Dalton Hall some six weeks before these interesting letters began to arrive. After that time they came in clusters, fast and frequent. The examination of these formed no small part of his occupation when he was alone.

Some of these letters were jocular in their tone, reminding him of his chronic impecuniosity, and his well-known impracticability in every thing relating to money. These jocular letters, however, never failed to remind him that, as he had made a rich match, there was no reason why he should not pay his debts, especially as the writers were hard up, and had waited so long without troubling him. These jocular letters, in fact, informed him that if a settlement was not made at once, it would be very much the worse for Dudleigh.

Others were from old sporting companions, reminding him of bets which had not been paid, expressing astonishment which was child-like in its simplicity, and requesting an immediate settlement. These were generally short, curt, and altogether unpleasant.

Others were business letters, containing the announcement of notes falling due. Others were from lawyers, stating the fact that certain specified claims had been put in their hands for collection, and requesting early attention.

All these seemed to come together. Misfortunes, says the proverb, never come singly, and duns may fairly be reckoned among misfortunes. These duns, however, troublesome though they were, were one by one got rid of by the simple and effectual process of payment; for Dudleigh considered it on the whole safer and better, under these peculiar circumstances, to pay the money which was demanded than to expose himself to arrest or lawsuits.

In connection with these affairs an event occurred which at the time caused uneasiness, and gave the prospect of future trouble. One day a gentleman called and sent up his card. It was Captain Cruikshank. The name Dudleigh recognized as one which had been appended to several dunning letters of the most importunate kind, and the individual himself was apparently some sporting friend.

On going down Dudleigh saw a portly, bald-headed man, with large whiskers, standing in front of one of the drawing-room windows, looking out. He seemed midway between a gentleman and a blackleg, being neither altogether one nor the other. At the noise of Dudleigh's entrance he turned quickly around, and with a hearty, bluff manner walked up to him and held out his hand.

Dudleigh fixed his eyes steadily upon those of the other man, and bowed, without accepting the proffered hand, appearing not to see it. His whole mien was full of aristocratic reserve, and cold, repellent distance of manner, which checked the other in the midst of a full tide of voluble congratulations into which he had flung himself. Thus interrupted, he looked confused, stammered, and finally said,

"'Pon my honor, Dudleigh, you don't appear to be overcordial with an old friend, that's seen you through so many scrapes as I have."

"Circumstances," said Dudleigh, "of a very painful character have forced me to sever myself completely from all my former associates—all, without exception."

"Well, of course—as to that, it's all right, I dare say," remarked the other, from whom Dudleigh never removed his eyes; "but then, you know, it seems to me that some friends ought to be—a—retained, you know, and you and I, you know, were always of that sort that we were useful to one another."

This was thrown out as a very strong hint on the part of Captain Cruikshank, and he watched Dudleigh earnestly to see its effect.

"I make no exceptions whatever," said Dudleigh. "What has occurred to me is the

"WELL, REALLY—YES, THIS IS IT."

same as death. I am dead virtually to the world in which I once lived. My former friends and acquaintances are the same as though I had never known them."

"Gad! something has come over you, that's a fact," said Captain Cruikshank. "You're a changed man, whatever the reason is. Well, you have a right to choose for yourself, and I can't be offended. At the same time, if you ever want to join the old set again, let me know, and I promise you there'll be no difficulty."

Dudleigh bowed.

"But then I suppose you're settled down in such infernally comfortable quarters," continued the other, "that it's not likely you'll ever trouble us again. Married and done for—that's the word. Plenty of money, and nothing to do."

"If you have any thing particular to say," said Dudleigh, coldly, "I should like to hear it; if not, I must excuse myself, as I am particularly engaged."

"Oh, no offense, no offense; I merely came to offer an old friend's congratulations, you know, and— By-the-way," continued Cruik-

shank, lowering his voice, "there's that little I O U of yours. I thought perhaps you might find it convenient to settle, and if so, it would be a great favor to me."

"What is the amount?" asked Dudleigh, who remembered this particular debt perfectly well, since it had been the subject of more than one letter of a most unpleasant character.

"The amount?" said Cruikshank. "Well, really—let me see—I don't quite remember, but I'll find out in a moment."

With these words he drew forth his pocket-book and fumbled among the papers. At length he produced one, and tried hard to look as if he had not known all along perfectly well what that amount was.

"Well, really—yes, this is it," he remarked, as he looked at a piece of paper. "The amount, did you say? The amount is just two hundred pounds. It's not much for you, as you are now situated, I should suppose."

"Is that the note?" asked Dudleigh, who was anxious to get rid of this visitor, and suspected all along that he might have a deeper purpose than the mere collection of a debt.

"That is the note," said Cruikshank.

"I will pay it now," said Dudleigh.

He left the room for a short time, and during his absence Cruikshank amused himself with staring at the portrait of "Captain Dudleigh," which hung in a conspicuous position before his eyes. He was not kept long waiting, for Dudleigh soon returned, and handed him the money. Cruikshank took it with immense satisfaction, and handed the

note over in return, which Dudleigh carefully transferred to his own pocket-book, where he kept many other such papers.

Cruikshank now bade him a very effusive adieu. Dudleigh stood at the window watching the retreating figure of his visitor.

"I wonder how long this sort of thing can go on!" he murmured. "I don't like this acting on the defensive. I'll have to make the attack myself soon."

PERSEPHONE.

By COMMANDER WILLIAM GIBSON, U. S. N.

In the boat's shadow leaning, looking down
In azure Cyane, whose fountain-lake
Was blue as the blue flax-flower in the fields,
Blue as the vernal-blue Sicilian sky,
I watched the sacred mullet in the depths—
Smooth, silver-bellied, living turquoises—
Gleam gliding through the dark green water-weeds,
And heard the seeming idle wind, that played
With tassels of the pool's papyrus fringe,
And lifted languid poppies in the wheat,
To earnest listening grow oracular.
Whispers of far-off mysteries of the Nile
Stirred in each fibre of those feathering plants;
Hints of high mysteries Eleusinian ran
Shivering through the corn; and a sweet voice,
Sweet and low, breathing from the Fountain Nymph,
Whose blue eye wells, with immemorial grief,
Told the old story of Persephone.

Thus sang the Nymph, what time the westering sun
Made golden Etna's pyramid of snow:

Deep-bosomed, slender-ankled in the meadows,
In maiden flower among the flowers of Enna,
Persephone, the fairest of immortals,
Daughter of Zeus and of divine Demeter,
Played with the daughters of Océanus.

With flowers at play, beneath the brow of Enna,
Where the soft meadows slope to the lake's margin:
Rosy Ocyrrhoë, and fair Calypso,
Lencippe, and Urania, and Ianthé,
And lovely Melobosis, and the rest.

She a sweet blossom, blooming her companions,
They wove the dance in mesh of spring-flower garlands;
Wove hyacinth, lily, crocus, orchis, iris;
Fair-ankled in the violets, these they gathered,
And the young roses budding bosom-high.

But lo! from one miraculous root Narcissus
Springs high—a hundred heads! A joy! A marvel!
The whole wide heaven was blown abroad in fragrance,
The whole earth laughed, and the wide waves of ocean,
And chaste Persephone stretched out her hands.

The Nymph sang on, the while the setting sun
Threw Etna's shadow far athwart the sea.

"CALLING ON HER GREAT MOTHER AND THE GODS."

It was the snare of Zeus! O fatal Plant!
Each flower flared up a torch; the dark earth yawned;
And from the gulf leaped the grim Lord of Hell—

Leaped Aidoneus, borne by immortal steeds,
Coal-black in hide and hoofs, hot coals their eyes,
Their nostrils snorting fiery-golden steam.

Flecked with the froth of hell, they champed the bit,
Pawing a whirlwind, as the grisly King
Stooped from his car, and snatched the astonished maid.

He bore her all-unwilling in his arms
Away from her white nymphs. They swept the plain:
The olives shook: the mountain-sides turned pale.

I heard the thunder of devouring speed;
The mountains echoing her immortal cry,
Calling on her great Mother and the gods.

I saw the flame-enkindling chariot-spokes
Whirl round by Hybla, the swift, smoking steeds
Tossing a tempest from imperious manes.

One piteous arm Persephone stretched forth;
All else of rose-white limb and rhythmic grace
Seemed gathered up in a black thunder-cloud.

Helios, the bright son of Hyperion, saw
Unmoved; my sister Arethusa heard,
And hastened to Demeter: I alone,

Catching the faint gleam of a golden head
Neath brows tremendous crowned with awful stars,
Sprang forward to oppose him unappalled;

But Aidoneus, with sceptred arm-sweep, smote
The earth to the core, and vanished. She was gone
From land, sea, starry heaven, and tribes of gods;

And I, unknowing that she might return,
Wept, utterly dissolved myself in tears,
And now am but a streamlet and a voice.

The Nymph ceased; as the solemn twilight fell
A graver voice took up the utterance:

Thou'st heard, O mortal, or in waking dream
Hast fancied thou hast heard this Water-Nymph
Relate her lamentable tale. No more
The Syracusans here slay the black bull,
Reddening this fountain, but the stream flows pure
From sacrificial blood for evermore. .
I am the Mighty Mother. I am she
Whom the Greeks named Demeter; who, they said,
Lighting a torch at Etna's lurid fires,
Sought her deep-bosomed daughter through the world;
Who, wandering, to Eleusis came, and there,
Below the city and the lofty wall,
Above Callichorus, on a jutting hill,
Ordained a temple and rites of import vast,
And taught Triptolemus to sow the corn.
There, having wearied cloudy Zeus with prayers
Importunate, her daughter was brought back
By winged Hermes; she to her on wings,
Delirious from despair and the rebound,
Leaped like a Maenad down the mountain-side;
But joy soon drooped: divine Persephone
Had eaten the deadly-sweet pomegranate seed,
And therefore must abide in Stygian gloom
For one-third part of the revolving year.
Then both, much grieving in their mighty minds,
Wept, but were comforted by Zeus the all-wise.
These are but old-world fables—they are dead.
Nevertheless I live. Lean low, and list
A murmurous motion in the growing grain,
An audible flow in the ascending sap
That thrills the tender shoot as with delight;
The beating of minutest arteries
In time and tune with the great sun and moon;
Yea, at all points of all this visible frame
Put thou a finger on my pulse. I live!
For I am Nature. And my child is Beauty,
The thing divinest in divinity
Save Love—and Love is but the holiest Beauty.

The mystery of my being and of hers,
 Yea, of thine own, was never yet revealed
 To old philosophy or science new;
 But follow thou the motion of my lips,
 And murmur deeper meanings than thou know'st,
 In invocation to Persephone.

I

Come, when the snow-drop peeps in northern meadows,
 Come, goddess, with the early almond blossom,
 Its sea-shell pink and perfume on thy cheek;
 Come, when the bloom-shaft shoots up in the aloe,
 Come, tressed in dripping fragrance like the acacia,
 The violet in thine eyes and on thy breath!

In finer grace slight not thy solemn emblems:
 Come, then, with all serene and stately lilies,
 And with the milky roses in the bud;
 Yet, coming, feed thine emerald torch of cypress,
 And flush with flower of flame-red the pomegranate,
 Nor shun the dim grot moist with maiden-hair!

Come with the loosened floods from snows of Etna,
 Come with the wild bees to the thyme of Hybla,
 Come with the birds of passage from the south;
 Rise on dark freshness of the sea at dawning,
 Voluptuous, strangely toned from Night that hid thee
 In majesty of Darkness crowned with flame!

From silent dew and thunder-shower we call thee,
 Persephone, by name that at Eleusis
 Was held too sacred for unhallowed lips!
 O Many-named! O Joy that thrills with Wonder!
 O Love! art thou indeed enthroned in Hades?
 Death! art thou daughter of the Heavenly King?

II

A Mater Dolorosa moveth Heaven:
 Lo! Light and Love from Winter's arms are risen,
 And all the ambrosial mystery of Spring!
 A season only: the supernal Powers
 Inveterately withhold the full fruition,
 Vex with conditions all their gifts to man.

We know in part. The seed must rot to quicken;
 And one comes up an Oak, and one a Lily,
 The whole Idea perfect in the germ;
 But what we are, and why we are, and wherefore
 We are the thing we are, behold, we know not,
 And grope in Nature for the secret hope.

Blow wide, O new year! Last year's flowers have perished;
 And yet the type lives on, and re-appeareth
 With not a ray lost from its crown of light.
 And last year's nests are empty; but the woodlands
 Ring as of old, the nightingales full-throated
 Are singing the melodious songs we know.

There's a divinity, which we call Beauty,
 Touches us darkling: when the wild weed blossoms,
 When in the worm is winged the butterfly:
 But hail, Persephone! hail, Spirit of Spring-time!
 Aid us to recognize thy breathing symbols
 And almost proof of Immortality!

SYRACUSE, SICILY, *May*, 1878.

THE NET RESULT.
THE WORK OF THE UNITED STATES FISH COMMISSION.
By WILLIAM C. WYCKOFF.

HEAD-QUARTERS OF THE FISH COMMISSION.

"Methought I saw a thousand fearful wrecks;
A thousand men that fishes gnawed upon;
Wedges of gold, great anchors, heaps of pearl,
Inestimable stones, unvalued jewels,
All scattered in the bottom of the sea:
Some lay in dead men's skulls; and in those holes
Where eyes did once inhabit there were crept
(As 'twere in scorn of eyes) reflecting gems,
That wooed the slimy bottom of the deep,
And mocked the dead bones that lay scattered by."

THE dream that afflicted the wretched Clarence, after due allowance is made for poetic exaggeration, probably gives a fair though sombre representation of what was till lately supposed to be the condition of the ocean bed. It were easy to show by abundant quotations that the sounding seas were supposed to wash beneath their surface the bones of unnumbered hapless mariners, and that the highway of nations was believed to be paved with the relics of disaster. To this picture there was afterward added a yet more weird feature. The notion, derived from experiments on the compressibility of air, gained acceptance, that water at great depths was rendered so dense by pressure that nothing could sink to bottom in the ocean. According to this theory, each substance would descend only to a certain point, determined in each case by its specific

gravity. Thus, while the victims of a shipwreck might rest at a few hundred feet below the surface, the heavier articles of the cargo would remain at various distances below them; but in the greatest depths even the anchor itself would never reach the ocean floor. And thus the sea became a mausoleum more strangely occupied than that in which Mohammed's coffin hung suspended, mid-water being substituted for mid-air.

Each of these conceptions is exactly the reverse of fact. Water is not compressible, and does not at any known depth hold heavy substances suspended in it. Relics of humanity of any sort whatever are among the very rarest of curiosities obtained in deep-sea dredging. Professor E. S. Morse, in the course of a discussion on the evolution theory, has cited two good illustrations in proof of the latter statement. When the Lake of Haarlem was drained, on whose surface the commerce of ten centuries had floated and several naval battles had taken place, no trace of man or his works was found in the land redeemed from the ocean. In the course of twelve years' dredging off the coast of New England, right in the track where sailing vessels constantly plied, one iron spike was the sole evidence of man's existence

brought up from the bottom. The writer of this article had, however, the luck to be present on the occasion of one of the rare exceptions to this general rule. In a dredging cruise of the *Blue Light*, last summer, in Casco Bay, the trawl brought up, along with anemones, star-fish, skates, and sculpins, a shoe of modern manufacture, and only remarkable, if at all, as to its size. What seemed a still more singular coincidence was that the next haul of the trawl brought up the mate of this big shoe. The pair were in a very dilapidated condition, as shoes, but they took high rank as curiosities. The occurrence was so unusual that it has been suggested that perhaps there was legerdemain about it—that it was a neatly contrived hoax. To this the only reply must be that “seeing is believing.” No one who saw the shoe taken out of the midst of the mud of the trawl pocket was troubled with the doubt that harassed King George about the apple-dumpling.”

Instead of being a sepulchre of wet bones, the ocean is a thousand times more replete with life than earth or air. “The first time you see a bucketful taken from sea-bottom,” said Professor Agassiz to the writer, “you will be astonished. I know I was. I had no conception before of the vast and crowded life of the sea depths. It is something marvelous.” It would be difficult to find a parallel for these close-thronging multitudes; they remind the observer of the abundant life that travelers describe in tropical forests, or of those localities where at night a lighted candle will attract such vast swarms of nocturnal insects as to extinguish it. Even the smaller kinds of these marine animals, scarcely visible to the unassisted eye, and very rarely attaining dimensions bigger than the average precious stone on the forefinger of an alderman, when they rise toward the surface, so make up by numbers what they want in size that the water

is fairly thickened by their presence. Navigators have told us of seas reddened as with blood; of broad belts of water tinged with an unnatural greenish hue; of sailing through vast spaces in which the ocean looked like milk; of the wake of the vessel gleaming with phosphorescent fire; nay, of the entire surface for miles around the ship glistening with an uncanny light, that poor superstitious Jack associates with churchyard will-o'-the-wisps—the light that never shone on sea or land, save when lost spirits were wandering abroad.

“About, about, in reel and rout,
The death-fires danced at night;
The water, like a witch's oils,
Burned green and blue and white.
And some in dreams assuréd were
Of the spirit that plagued us so;
Nine fathom deep he had followed us
From the land of mist and snow.”

The man of science, dipping up these colored waters, finds them instinct with life, the estimate sometimes exceeding 100,000 animals to the cubic foot. But even to him it has been a puzzling question whence came so suddenly such vast swarms. It is quite recently that we have learned something of the habits of these tiny creatures, and ascertained that for the most part they live far below, only rising to the surface at certain seasons, and especially at night. These habits are partly connected with reproductive functions and partly with the search for food, several species of these animals, small as they are, feeding on others yet more minute. From many descriptions of them that might be cited, perhaps the following extracts will suffice, taken from the notes appended by the late Dr. R. Knox to his admirable translation of Milne-Edwards's *Manual of Zoology*:

“In frequent excursions to the Isle of May during last year I found that the *maïdre* consisted of one immense continuous body of minute animals.... Crustaceans existed in the greatest numbers, or rather mass-

THE LABORATORY.

es, for it gives a faint idea to speak of numbers. . . . On looking into the water, it was found to be quite obscured by the moving masses of entomostraca, which rendered it impossible to see any thing even a few inches below the surface. But if by chance a clear spot is obtained, so as to allow the observer to get a view of the bottom, immense shoals of coal-fish are seen swimming lazily about, and devouring their minute prey in great quantities. . . . These, however, are not the only animals which prey on the immense bodies of *maïdre*. . . .

"On one of my occasional visits to the Isle of May I observed that at a considerable distance from the island the sea had a slightly red color, that this became deeper and deeper as we neared the island, and also that the surface of the water presented a very curious appearance, as if a quantity of fine sand were constantly falling upon it. . . . Presently I found that both phenomena were caused by a great number of small red entomostraca."

Speaking of a particular species found among the entomostraca, the note cites the statements of M. Rousel de Vauzeme:

"It is found in the Pacific Ocean and in the middle of the Atlantic Ocean, about 40° south latitude. It forms, he says, very extensive banks, which impart a red color to the water, and which furnish a plentiful supply of food to the whales frequenting those seas."

There will be frequent occasion in the course of this article to refer to the lack of correct information until very recent years concerning the inhabitants of the sea. A consciousness of ignorance is apt to incite a search for knowledge, especially when with such consciousness there is the experience of heavy pecuniary loss. It was the fact that year by year the fisheries of the Atlantic coast were diminishing in productiveness, and vast industrial interests dependent on them were gradually dying out, that has rendered it necessary to study the works of nature, and ascertain, if possible, the original causes of such wide-spread misfortune. Our coasts were once the most prolific region of the ocean in rewarding the labors of the fisherman. All the records of the earlier settlers, all the traditions of Indian lore, testify to the abundant yield of edible fish. From a large quantity of this testimony collated by the Fish Commission a few quotations will prove entertaining in their quaintness, while demonstrating a very different condition of the fisheries in those days from the present:

"The Herrin, which are numerous, they take of them all summer long. In *Anno Dom.* 1670. They were driven back into *Black-Point* Harbour by other great fish that prey upon them so near the shore that they threw themselves (it being high water) upon dry land in such infinite numbers that we might have gone up half-way the leg amongst them for near a quarter of a mile. We used to qualifie a pickled *Herrin* by boiling of him in milk."

"The *Alewite* is like a *Herrin*, but has a bigger belly; therefore called an *Alewite*; they come in the end of April into fresh Rivers and Ponds; there hath been taken in two hours' time by two men without any Weyre at all, saving a few stones to stop the passage of the River, above ten thousand."

"The *Basse* is a salt-water fish too, but meet an end taken in Rivers where they spawn; there hath been 2000 *Basses* taken at a set; one writes that the fat in

the bone of a *Basse's* head is his brains, which is a lye."—*John Josselyn's Voyages*, 1675.

"I was contented, having taken by hookes and lines with fifteene or eighteene men at most, more than 60,000 cod in lesse than a moneth."

"There hath beene taken a thousand Bayses at a draught, and more than twelve hogsheds of Herrings in a night; of other fish when and what they would, when they had the meanea."—*Advertisements for the Inexperienced Planters of New England*. Captain John Smith, London, 1631.

"And is it not pretty sport, to pull vp two pence, six pence, and twelue pence, as fast as you can hale & veare a line? He is a very bad fisher, cannot kill in one day with his hooke & line, one, two, or three hundred Cods: which dressed & dried, if they be sould there for ten shillings the hundred, though in *England* they will giue more than twentie; may not both the seruant, the master, & marchant, be well content with this gaine? If a man worke but three days in seauen, he may get more than hee can spend, vnlesse he will be excessive."—*Force's Historical Tracts*, vol. II, Tract 1, p. 31.

"At one draught they haue taken 1000 *basses*, & in one night twelve hogsheds of herring."—*Ibid.*, vol. II, p. 16, Tract 2.

"I myselfe, at the turning of the tyde, have seene such multitudes passe out of a pounce, that it seemed to me, that one might goe over their backs drishod."—*Ibid.*, vol. II, Tract 5.

What would the gentlemen of the Cuttyhunk Club, to whose rod and reel a dozen bass a day is good fishing, say to such experience as the following:

"There is a Fish called a *Basse*. . . . Of this Fish our Fishers take many hundreds together, which I haue seene lying on the shore to my admiration; yea, *their Nets ordinarily take more than they are able to hall to Land*, & for want of Boats & Men they are constrained to let a many goe after they haue taken them, & yet sometimes they fill two Boats at a time with them."

"A little below this fall of waters, the inhabitants of Water-towne [near Boston] have built a Wayre to catch Fish, wherein they take great store of *Shads* and *Alewites*. In two Tydes they have gotten one hundred thousand of those fishes. . . . I have seen ten thousand [*alewives*] taken in two houres by two men, without any weire at all, saving a few stones to stop their passage up the river. . . . The *Basse* continuing from the middle of April to *Michaelmas*, which stayes not above half that time in the Bay; besides here is a great deal of Rock-cod and Macrill, insomuch that shoales of *Basse* have driven up shoales of Macrill from one end of the Sandie Beach (*Swampscot*) to the other, which the inhabitants have gathered up on wheelbarrowes."

Making all due allowance for the latitude which even the Puritans may have taken in telling fish stories, it is quite evident that there was such fisherman's luck then as we never see nowadays. The business of capturing fish not only brought the means of support to a large population, but it was the nursery of our navy. The ship-builder's art prospered because of it, and a hardy, skillful race of sea-faring men was reared in the dangers and toils of our coast fisheries that enabled us to contend successfully both in war and peace with the Mistress of the Seas. That with the increase of population there has been a diminution of fish was generally admitted. How great was the deterioration of the fisheries was not only an open, it was a much-vexed question; but that was only

THE BLUE-FISH.

one of many piscatorial problems on which opinions were widely at variance. There were men who shrugged their shoulders, and said that the trouble was not of fewer fish, but of more numerous fishermen; that the sea produced as liberally as ever, but there were more people to eat fish, and greater facilities for carrying the fish to the eaters; and hence an apparent, not a real scarcity. One of these doubters, brought before a committee to testify, resolved the whole problem into the natural tendency of fishermen to grumble at their luck. He thought the complaint was at least as old as the record of the Lake of Galilee, where the men who, nevertheless, had somehow contrived to make a living by the business, being asked about it, were prompt to declare that they had "toiled all night, and taken nothing."

Doubtless there is wisdom in a multitude of counselors, but it is sometimes difficult to extract it. The assembled wisdom of Massachusetts and Rhode Island, filtered through committees, came to exactly opposite conclusions respecting fish matters. A committee from the former State decided that no legislation was expedient, while one from the latter advised the most stringent re-

strictive laws. The one committee believed that there was no notable change due to the work of man in the fisheries; the other committee estimated that a destructive system of taking with nets had diminished the profit of fishing during the previous ten years to the extent of \$100 per annum to each of one thousand families on the coast of Rhode Island. Still, however committees might differ, there was a general belief from Maine to Florida that the fisheries had declined; and it was a faith illustrated by works, or rather by the absence of them, for whole communities in several localities went out of the business of fishing altogether.

But these differences were harmony itself compared with those that beset the question of the causes of the decline, for even the Massachusetts committee admitted that there were occasionally years, perhaps series of years, when the supply was deficient. As to the cause, first, all the line fishermen attributed it to the work of those who used nets. So far, indeed, there was unanimity. But the line fishermen caught a comparatively small number of fish, and their prejudice against net fishers was, to say the least of it, deficient in novelty. Even the gentle

THE PORGY.

THE SEA-ORANGE.

Izaak utters this complaint. Speaking of salmon, he says:

"And their fry would, about a certain time, return back to the salt-water if they were not hindered by weirs and unlawful gins which the greedy fishermen set, and so destroy them by thousands. The taking fish in spawning time may be said to be against nature. It is like the taking the dam on the nest when she hatches her young; a sin so against nature that Almighty God hath in the Levitical law made a law against it. But the poor fish have enemies enough beside such unnatural fishermen."

Unnatural or not, the method that effects the most work with the least labor must take precedence of the more toilsome and less efficient processes. If machinery can supersede hand labor, the latter can not be protected long by legislation; nor should it be, to accord with the spirit of our institutions. Nets have, however, been used from a remote antiquity. They represent vested capital as well as the cheapest mode of catching fish. Why should legislation interfere with their honest gains? The net-owners, too, offered fair theories for the cause of diminution, where they acknowledged the fact. The waters were poisoned or polluted by manufacturing establishments. That was cause enough for one

class of theorists. Another group rested their faith on an alleged deficiency of the food of fishes, declaring that the beds of marine animals on which fishes feed were depopulated. Even the line fishermen gave adhesion to this belief, and a skillful amateur of the rod at Cuttyhunk assured the writer that the scarcity of bass was due to the multiplication of lobster pots along the shore. Then there was a class of theorists, among whom was the Massachusetts Commission, whose belief was that

the increase of carnivorous fishes, such as the weak-fish, and especially the blue-fish, was competent to explain the whole matter. And lastly, there was the general theory that the causes lay in remote conditions of ocean currents, and the movements of fishes whose habitation was for the most part far out at sea. The Gulf Stream was the final refuge of these theorists; and as every body knows that every thing that can not otherwise be accounted for in wind and storm and climate may be relegated to changes in that current, its broad shoulders were made to bear in addition the deterioration of the fisheries.

Such was the wild confusion which pervaded this entire field of inquiry when the

THE SEA-OCUMBER.

THE SEA-HORSE.

United States Fish Commission was organized, and Professor Spencer F. Baird, of the Smithsonian Institution, was appointed the Fish Commissioner. The questions to be answered were clearly such as only scientific investigations could properly handle. Perhaps the reader imagines that there was an exceedingly profitable "job" included in the undertaking. Not a bit of it. A single fact will set that suspicion at rest. The Fish Commission has no perquisites and no salary. Taken thus entirely out of the field of political ambition, it becomes purely a matter of scientific research, and it has been carried on exclusively by the recognized methods of scientific inquiry. The different departments of the government have extended due facilities for this research, but nothing more.

The writer was exceedingly fortunate in his visit last summer to the head-quarters of the United States Fish Commission. He had the company of Professor Morse, of Salem, Massachusetts, best known to the public by his bimanous skill at the blackboard as a lecturer, but to the world of science as a naturalist successful in lines of original research. He has done good work in deep-sea dredging and the study of submarine animals. The Commission was established on Peake's Island, Casco Bay, Maine. A lively little steamboat took us thither from Portland, named the *Express*; and never was there such a confusing name in steamboat nomenclature. One never knew on Peake's Island, when any thing was to be sent or brought "by the express," whether the steamboat was meant, or that express company for which, as the conundrum has it, Eve was created. Every fair day the steamboat was crowded with excursion parties visiting the islands of Casco Bay, or carrying "campers," who establish themselves in tents upon these islands, during the summer, for two or three

weeks at a time, and leave behind them in the pine groves, at the close of the season, a varied assortment of clam shells, empty bottles, and broken crockery.

If the wind is brisk the *Express* rolls a little, and many faces among its passengers assume a serious aspect and an ashen hue. But the good genius of that shore, Captain Oliver, a bluff and cheery mariner, with yet a look of thoughtful care, evidently born to command a steamboat, and with whom in charge you would feel safe in a mid-Atlantic cyclone, has a pleasant word for each passenger as he moves about the crowded deck. There are shockingly unpoetic names for the islands; but even "Hog Island" is a thing of beauty. There is an exquisitely rounded slope, on which straight pine-trees rear their points like a coronet—a gem of deepest green set in the silver of the bay—for which our prosaic forefathers found no better name than "Pumpkin Knob." There was no knob of sentimentality in the skulls of the Roundheads.

Peake's Island has three landings. Of these the one nearest the head-quarters of the Fish Commission was but rarely favored by the *Express*; but as the whole island is

THE SEA-POTATO.

not much over a mile in length, there was not a long walk from either of the other landings. Yet even for showing the path over this short distance one of the natives, who afterward justified the exaction on professional grounds—he was a coast pilot—charged the captain of the *Blue Light* a dollar.

The principal feature of the head-quarters when the *Blue Light* was absent—as happened to be the case on the first morning of our visit—was the laboratory. It rarely obtained so elegant a designation as that from the natives of Peake's Island. To them it was merely "the fish-house." To all appearance it was certainly unpretending, both within and without. Its interior had never been finished or painted. What it was originally built for it is hard to say. Its wide doors indicated a stable or a barn; but why should any body choose the head of a dock for such a structure? It might have been meant for a grocery store if there had been a village behind it, but the three dwelling-houses on the rising ground could scarcely have warranted such a speculation. And it was evidently not intended for residence. Whatever it was built for, it suited the Fish Commission to a nicety.

Professor Morse piloted the writer (without charge) into the laboratory. The first story contained an indescribable variety of tackle and gear and sea-faring miscellany. We ascended a narrow staircase without balusters. Sometimes the floor of this room looked like the sea-shore where fishermen are hauling their nets and miscellaneous creatures are flopping about. But even though there had been a recent use of the broom, crabs were rarely wanting. There were gen-

A WREATH-BEARING WORM.

erally a few of them crawling around the floor, and after lifting your feet successively to clear a pail, a basin, a can of alcohol, or other receptacle of a specimen, you were quite likely to set them down on some treasure of the deep—perhaps to crush a lively "horseshoe," a quahaug, or a sea-urchin, or to slip on a mass of sea-weed or sponge.

Around the room were the tables of the naturalists, each with one or two microscopes and lamps, and a plentiful supply of tubes and bottles. The shelves on the walls looked like a drug shop with a literary turn. They had a mixture of bottles and books, with here and there slender sponges and other specimens hung up to dry. Through a hole in the ceiling nets were visible in the cock-loft. The whole place had a curious smell—fishy, marine, scientific, alcoholic, kerosenic, queer. Professor Morse seized one of the naturalists around the waist, and proceeded to execute a waltz among the pails and crustacea. "I love it," he exclaimed, stopping, panting, and looking around. "I love it all. The very

HERMIT-CRAB ENSCONCED IN POLYPS.

NEW DEVIL-FISH.

smell brings back my happiest hours, when I was thus engaged. With every day's dredging there is the chance of a rarity or a novelty. When you come to examine under the microscope the day's haul, you may find some new creature, something that no man has ever seen, or at all events recognized, before. Tell me, you who sit at the focus of news, is there any thing that comes to you in the midnight hours by telegraph or steam from the ends of the earth that has half the novelty or freshness of this?" and he pointed to some strange wrigglers in a pan of salt-water.

Enthusiasm is infectious. The corps of naturalists that spent the summer on Peake's Island brought with them an atmosphere of research. Their visitors soon became almost as deeply interested in the strange forms of life in the sea as were those who made these studies a business. Not even the probability of seasickness could keep back applicants for a trip on the *Blue Light* to see the mysteries of dredging. She is a trim little steamer, belonging to the Coast Survey, and was fitted for the service of the Fish Commission not less by needful appliances and her special capacity for doing its work than by being placed in command of Captain L. A. Beardslee, U.S.N., who was the right man in the right place. He entered into the investigations himself, put his heart into the work, and by some exceedingly ingenious contrivances, as well as by general good management, materially aided the Fish Commission. Deep-sea dredging is no holiday performance; pleasure excursions and picnics are quite incompatible with the hard work it entails. The crew of the *Blue Light* were picked men, and had acquired peculiar skill in this dredging business. Perhaps to describe

the work will best indicate some of its exigencies.

A group of naturalists is assembled on the forward deck. It is a cold morning at sea, whatever it may be on shore, and as the propeller drives the boat forward through a short, chopping swell, the wind and spray make heavy overcoats indispensable. The animals you are in search of are on or near the bottom of the sea beneath you. There are instruments for sweeping the sea-bottom, for scraping it, for raking it, for dragging over it. First, then, the character of the sea-bottom must be ascertained. This is done by sounding, the lead having a tall cup beneath to bring up some indications of the material. A curious thermometer is lowered with the lead, so contrived that it records the lowest temperature it meets with; it appears to be constructed to show cold rather than heat. Given these factors, the depth, the character of the bottom and its temperature, the naturalist knows at once by previous experience what will be the main features of the animal life below. It is possible to prophesy before they are caught what fish will be brought up in the net. This is one of the great results already accomplished in the science of dredging. Let us suppose that, from the indications, the scraping process seems the most promising. The instrument for this is the dredge. It is not a beautiful implement, but it represents the most advanced scientific ingenuity—is the product of at least a score of failures. It looks something like a United States mail-bag; but while that is contrived with the intention of closing, the mouth of the dredge is always open. Such a bag would have been appreciated at Washington in the days of the franking privilege, when every thing was fish that went into the net. This bag with the reverse of a lock-jaw is to lie flat on the sea-bottom and be dragged with the open mouth in front. The lips of this mouth are straight pieces of iron. As the dredge is pulled forward, every thing the lower lip shovels up goes into the bag, or, rather, into the net which is within the bag, the latter being a mere canvas covering to protect the net from abrasion, and not amounting to much as a bag, since it is bottomless.

Now the great trouble about all these

THE DREDGE.

a. a. Iron frame.—b. b. Net.—c. c. Canvas bag without bottom.—d. Heavy line.—e. e. Light line.

THE FOLIAGE-BEARING MOLLUSK.

contrivances for exploring the depths of the sea is that when they get down there they are very apt to stay down. The dredge that was taken out in the celebrated *Hassler* expedition, with an immense amount of line, was lost the first time it was let down, which was the more provoking to Professor Agassiz because he had promised in advance to bring up in it such wonderful things. Two classes of contrivances are brought to bear when the dredge catches in the rocks below. First, if the strain of dragging it becomes excessive, one of the ropes which pull the corners of its mouth, being weaker than the other, will break; then the dredge will be pulled by one corner instead of mouth foremost, and most probably will slue round and be extricated. The second order of contrivances is meant simply to ease the excessive strain in case of catching fast, to give time, so that the motion of the boat can be stopped or reversed. The English method of accomplishing this is by substituting a drum of India rubber, called an "accumulator," for some portion of the drag rope, the drum when pulled compressing the air within it, in case of excessive strain. Captain Beardslee's method, which in last summer's experience answered every purpose, is simply to hold in reserve a certain amount of slack of the main rope by means of a lighter rope attached to it, on which the ordinary pull comes. If the light rope breaks, the slack of the main rope comes into play, and gives time. The contrivance is called a "check-stop."

We left our naturalists shivering at the bow of the steamer, not at the stern, for there the dredge might get foul of the wheel. A little, puffy, self-sufficient engine is to do the work of letting out and reeling in the drag rope, from which the dredge is suspended. A very handy machine is this little donkey-engine on the bow, operated by means of a small steam-pipe from the boiler. With such an engine on board, our North River and Sound steamers might save three-fourths of the time they now take to "round

to" and back into their docks—a time of most aggravating delay to their passengers. Well, the dredge is swung out by the davit from the bow, and let down alongside; the steamer backs to drag the dredge, and moves slowly. Suddenly you see the drag line stiffen. The attentive sailor in charge gives the

A VERY LONG POLYP.

signal to reverse the engine—that is, to start the boat ahead—the man in the wheel-house pulls the bell, the engineer pulls the lever of the main engine, the donkey is started to let out the drag rope by unwinding; every thing is done as quickly as possible; but long before the strain can be relieved the short rope that held in the slack of the drag snaps with a thud that sounds all over the steamboat; and now the reserved slack comes into play.

An old salt on board the *Challenger*, the British government vessel now engaged in circumnavigating the globe on a scientific exploring expedition, has given a life-like sketch of these occasions, including a description of the accumulator:

"We flies in all directions, like cats on houses sportin';
The luff cries out, the donkey shies, and makes a dreadful snortin'—
It ain't a regular ass, Bill, but one of them inventions
They puts aboard a man-of-war with various intentions.
The donkey does the haulin' in, which is no doubt a blessin',
For if it had to come by hand, oh Lord! 'twould be distressin'.
We hangs the dredge at the yard-arm to a sort o' kind o' buffer—
At explanation, Bill, yer no I always was a duffer—

It ain't a bad dodge neither; for when it's pulled it stretches,
And gives a kind o' surge when the dredge at summat ketches;
It's like a koncertina, Bill, but where the wind is squoze,
From end to end a set of stays like Inde rubber goes:
A block is tacked at bottom, and through it runs the line—
Which is the wery bane o' life to this old pal of thine;
I've burnt my hands, I've spiled my close, I've torn my underneath,
I've barked my shins and nicked my back and loosened all my teeth—
All through that blessed line, Bill, which, triffin' as it seems,
Is wuss nor all the nightmares that ever hunts in dreams.
The care that is required for to keep that line from breakin',
If you're stationed near the donkey, is a awful undertakin';
The thing flies thro' your fingers, and, if stationed near the drum,
It's safe to nab yer somehow by a finger or a thumb;
Then there's the pipe and others, Bill, that raise a shout, and call
Till yer'd almost think they'd been and caught the devil in the trawl."

Presently the boat is brought back so that the davit is directly over the dredge, the reeling-engine puffs, and the apparatus is lifted: for a while its perils are over.

In the *Sparrowgrass Papers* we are told of the danger of remarking on the emptiness of the net. "Nary fish!" is likely to be a correct statement of the net result if the dredge catches shortly after being let down. But let us suppose it brings up a heavy burden, not, indeed, an immense rock, as it did one day last summer—a trophy that stood at the laboratory door for many a day afterward—but a good catch; what is it likely to be? Principally mud. So the first thing to be done is to empty the contents of the dredge into a sieve, and then apply to that a stream of water through hose from the engine-room. And at last, all wet and dripping, and not over-clean, the trophies are deposited on a tarpaulin on deck.

Then is the important moment. Like infants with mud-pies in prospect, the naturalists plunge in up to their elbows. Now this creature is dragged out, now that, and popped into a bottle, a jar, a basin, or a pail. Drawn in and contracted, mere lumps, many of the animals seem scarcely to warrant the interest they excite, though some of them, like the sea-cucumber and the sea-orange, justify their names by similarity to the fruits of the earth. For the present all that it is necessary to do is to keep the valuable specimens in

THE CHECK-STOP.

A, A. Davit.—B. Drag rope.—C. Check-stop rope.—D, D. Side of vessel.

the dark in sea-water surrounded by ice. Deficient light and the freezing-point are conditions of good health to these organisms. A complete list of every thing captured at each haul is made out; and you may safely lay a wager that out of the fifty or sixty different creatures brought up at a single haul of the dredge, not half a dozen are familiar, or have common names.

Sometimes the trawl is substituted for the dredge. It is simply a conical net with side pockets on the inside. A row of leads takes the place of the formidable scrapers of the dredge, and of course the yield of mud and of them that dwell therein is less.

To quote again the Jack Tar of the *Challenger*:

"The trawl's for fancy dredgin', and the work's about the same,
The only difference I can see is that wot's in the name."

But, although it sweeps near the bottom, the trawl is apt to catch a larger proportion of recognizable creatures than the dredge. Its yield is more like that of an ordinary net, and includes a greater number of what we are willing to accept as fishes. To come upon a porgy, for instance, among such outlandish animals was like meeting an old acquaintance in a foreign land—a good, common, plain, recognizable porgy. Call him thus, not "scup," as they do to the Eastward, nor "scuppaug," nor "mishcup," as if, forsooth, that sedate fish were given to swinging around the circle, nor yet *Stenotomus argyrops*, as the men of science have him; to us he shall ever be honest porgy. It seems he objects to the cold shoulder of Cape Cod, and will rarely go round its elbow. He is, of course, only a chance visitor in Casco Bay. Desperate efforts were made to transplant him before the art of fish-culture was understood. In 1832 a whole smack-load of porgies was brought by the fishermen of Boston, and let loose in their harbor; and in 1835 Captain Downes, of Holmes's Hole, performed a similar service for Plymouth Harbor. But the porgy still sticks to his first love, and seeks the Cholera Banks as the predestined prey of excursion parties on steamboats from New York.

Fortunate for the other fishes of New England would it be if the blue-fish (*Pomatomus saltatrix*) were equally prejudiced against the stern and rock-bound coast. But this butcher of the seas has a wide range of habitat, and goes by a variety of names. In New Jersey and at Newport he is the horse-mackerel, in Maryland the tailor, in Virginia the green-fish, in South Carolina the skip-jack. Even in New York he is not sure of his name; the young go by the name of skip-mackerel in the city, and higher up

THE TRAWL.
a, a. Beam.—b, b. Shoes or runners.—c, c. Lead line.—d, d. Net.—e, e. Pockets.

the Hudson are known as white-fish. That blue-fish should be also white-fish and green-fish is not perhaps more wonderful than the paradox of our childhood, that blackberries when they are green are usually red or white; but it fairly represents the confusion in current language which has made scientific names a necessity of natural history.

Whatever doubt there may be respecting the food of other fishes, there is none about that of the blue-fish. "It has been well likened," says the report of the Fish Commission, "to an animated chopping-machine, the business of which is to cut to pieces and otherwise destroy as many fish as possible in a given space of time.....Going in large schools in pursuit of fish not much inferior to themselves in size, they move along like a pack of hungry wolves, destroying every thing before them. Their trail is marked by fragments of fish and by the stain of blood in the sea, as, where the fish is too large to be swallowed entire, the hinder portion will be bitten off, and the anterior part allowed to float away or sink. It is even maintained with great earnestness that such is the gluttony of the fish that when the stomach becomes full the contents are disgorged, and then again filled." The stomach of the blue-fish of all sizes, with rare exceptions, is found distended with other fish, sometimes to the number of thirty or forty, either entire or in fragments.

"That's the ugliest thing God ever made," exclaimed one of the *Blue Light* seamen as he shook out a goose-fish on the deck; and none of us felt inclined to dispute the assertion. Yet this was not a very large one, considering that specimens of the *Lophius americanus* have been caught that weighed seventy pounds, and this was not bigger than an average carpet-bag. But it was a sight to make a well man seasick. Its squat, slimy body merges into a head of almost equal breadth, terminating in a mouth that stretches, as one might say, from ear to ear. Open this mouth, and the cavity disclosed is so disproportionate that it seems to consti-

THE GOOSE-FISH.

tute the entire fish. You can readily believe that there is little else, that its liver has no oil, and its flesh no fat—a rare condition in fishes. You can give credence to the story, told on good authority, of a goose-fish captured with a fish as large as itself, and of its own species, in its mouth. Such a monster is capable of any thing. Wouldst have a goose-fish? Get a large, cheap carpet-bag; trim its bottom corners so as to taper to a tail; paint the bag of a dirty greenish-brown; set up half the iron part of a garden rake lengthwise on the back, below the middle, for a dorsal fin; fasten a pair of naked chicken wings at the sides, and a pair of duck's feet near the middle, underneath; dip the whole in soft soap, to make it slimy, and cut the handles off. You have what would pass for a goose-fish of a foggy morning. About where the key-hole of a carpet-bag is, the fish has two long, slender, curious appendages called tentacles. They are really extensions of the spinous rays of the dorsal fin. The animal has the power of moving them. It is said that they serve as a lure to fishes, as they look like marine worms; that the lophius lies buried in the mud with only these streamers visible, but

ready to open his cavernous jaws whenever a fish nibbles at the bait. Probably their poultry-like fins give the goose-fish their name; but possibly it is their stupidity, as they are prone to run ashore and perish; and if some naturalist, with the feelings of a Bergh, puts them afloat, they are quite as likely as not to repeat their mistake.

It is not generally known that we have in these waters a fish capable of giving strong electrical shocks. The *Torpedo occidentalis*, when, for instance, it weighs sixty pounds, is a formidable antagonist, giving shocks strong enough to knock a man down. We can not refuse our sympathies to a certain Yankee dog that acquired great skill in catching flounders with his mouth in the shallow water of the coves. On one occasion he caught a torpedo in this manner. The shock he received convulsed him. Howling piteously, he dropped the fish, and never could be persuaded to go fishing again.

The torpedo is evidently able to take care of himself; but what chance has the unwieldy sunfish (*Orthogoriscus mola*) in the struggle for existence? He may weigh as much as two hundred pounds, and be two

THE TORPEDO.

and a half feet in width, but he shall only be twice as long as he is broad. With such a build he can never get away from his enemies. One would think he was born a verb, according to Sam Weller's suggestion, to be, to do, and to suffer. But he has his own defense. He is clad in a cartilaginous case which defies the teeth of other fishes; it is nearly two inches thick; tough and elastic, it protects his oily carcass from all except the fisherman, who esteems sunfish-oil as a more sovereign thing for wounds and sprains than parmaceti.

One of the most grotesque creatures in existence is the *Hippocampus*, or sea-horse. Not only is this true of its quaint shape, but even its structure is anomalous. Something more like bunches of feathers than gills does duty as its branchiæ. But especially queer are its habits. Ladies who are interested in the rights of their sex should provide themselves with sea-horses and study their peculiarities. The male of this animal takes entire charge of the business of incubation, while the female wanders away at her own sweet will. The father carries the eggs around with him in an abdominal pouch provided for that purpose until they are hatched. And they are a great trouble to him; but he attends to the business in the most exemplary manner.

Such are some of the animals we may find on the deck of the *Blue Light*; but if we would see the full glories of the stranger creatures of the deep we must go to the laboratory by night. *Cæsar clam et nocte*. Let us begin with a mollusk. But tread lightly, so as not to jar these sensitive plants that have opened out their tendrils in dark-

THE SUNFISH.

ness and ice-water. Lamp-light will not disturb them. No wonder the earlier naturalists took them for flowers. This *Dendro-notus arborescens*, for instance, surely carries vegetation on his back; like the forest of Birnam approaching Dunsinane, "a moving grove." His foliage-like features are indicated in both his names. He is a poor, naked, eyeless mollusk; and as he has no shell to protect him, or eyes to perceive danger, or arms to seize his food, perhaps this exquisitely sensitive appendage, which when undisturbed he spreads to its full extent, may serve more or less to supply these deficiencies, though its prime service is that of gills. He has, however, one mark of respectability, a slender, narrow foot, with which he treads lightly among the hydroids.

Let us look at the fruits of the sea. Many of them have stinging powers, and there is no need for a label, "Visitors are requested not to handle the fruits." The sea-orange (*Lophothuria fabricii*) and the sea-cucumber (*Pentacta frondosa*) develop astonishing beauty in their cold bath. The first had, in the specimen the writer saw (which is figured), all the richness of color and something of the general appearance of a blood orange. The wreath of tentacles which it threw out was of the most delicate shades of pink. The cucumber, taken at thirty fathoms in Passamaquoddy Bay, was externally of a

ANCHORS AND SKIN-PLATES OF A HOLOTHURIAN.

A FIXED JELLY-FISH.

deep rich green, and really looked like a cucumber; not, indeed, comparable to some that draw prizes at agricultural fairs for growing by the yard, but of modest dimensions, though no mere gherkin of a thing—say about six inches long and ten in circumference. It, too, threw out at night a magnificent wreath of tentacles. Agassiz says the cucumber is eatable, and has a lobster flavor. Any body may try it who wants to. Forbes says the Shetland fishermen class it as “*pushen*,” which he translates as poison.

A near relative of the sea-cucumber, dignified with the long name of *Leptosynapta girardii*, should be a favorite with mariners. It is covered with the symbol of the deep. The skin is filled with minute perforated oval plates, to each of which is attached by the shank a perfect little anchor. Doubtless the flukes of these anchors give it the means of keeping itself in place. The animal has a bad tendency when captured to break itself to pieces. This propensity to

suicide is, however, characteristic of many of the dwellers in the sea. The sea-potato is not remotely a relative, but the likeness of *Boltenia reniformis* to that esculent is very noticeable. Its stem looks like one of those roots which are occasionally attached to a potato. It should be stated particularly that the likeness of these animals, when freshly caught, to the things after which they are named does not continue after their death. Preserved in alcohol, they lose all their beauty.

One can not learn natural history in a few hours, and a series of treatises might be written that would fill several volumes on the animals brought up at any one haul of the dredge. At best we can only look at a few without any method in our selection. Certain animals are apt to be associated. Thus on the stem of the boltenia there are little growths like foliage, which under the microscope turn out to be hydroids—the little jelly-fishes of whose wanderings and transformations into medusæ Agassiz has told us such interesting stories. No grub that develops into a butterfly under-

goes a stranger metamorphosis. As a specimen of what the animal may finally become, the *Lucernaria quadricornis* will serve for illustration. This is one of the most recently discovered creatures, being among the nov-

A WORM WITH CIRRI EXTENDED.

elties obtained in last year's work. In this ultimate form it is a fixed jelly-fish, having a sucker at the bottom, by means of which it clings permanently to some rock or stone.

Among the liveliest captives are the hermit-crabs (*Eupagurus pubescens*). Like the typical New Yorker, they are always on the search for a new domicile. Each crab wants a shell of his own, for the posterior part of his body is soft, and requires protection; but nature has not furnished him with a shell, so he goes about to find one, usually the shell of some dead mollusk. Having in-

A WORM WITH CIRRI RETRACTED.

over the surface of the shell; buds like the parent polyp will arise from the expanded surface, which keeps on extending outside and at last inside the shell, which thus becomes ornamented with from three to ten of these polyps. Finally, by a chemical process, the basal membrane of the polyps dissolves the shell entirely, and absorbs it, though still retaining its interior shape. Meanwhile the hermit is apt to be more contented than usual, having a house that is elastic enough to expand with his growth. The stinging powers of the polyp are a protection for him against other crabs. Doubtless the polyps are equally well suited with the arrangement, for, like all the anemones, they are voracious, and the crab carries them about to new feeding grounds. With their delicate shades of orange or salmon, their tentacles, when expanded and waving, present a beautiful appearance.

While on the subject of polyps let us not lose sight of one of the latest discovered, *Cerianthus borealis*, another of the children of the Fish Commission. Its body is singularly elongated and tapering. It has a splendid wreath of tentacles, the inner or oral set being of a pale chestnut, and the outer or marginal set of a deep salmon-color, the longest barred with spots. One specimen of the cerianthus was

eight inches long, which for a polyp is very long indeed.

Spirorbis nautiloides is a small creature, and has the misfortune to be a worm. It is generally found attached to sea-weeds, shells, stones, etc. It forms solid calcareous tubes coiled in a spiral. But no worm of earth ever put out such an elegant wreath of branchiæ as distinguishes the spirorbis. It

sported himself partially in it, with his head and claws out, he travels about with it. But sooner or later the demon of discontent seizes him. Perhaps he outgrows his shell; perhaps he sees another which he thinks will fit him better. Moreover, he is pugnacious, and if two crabs meet, there is a battle, and the victor intrenches himself in the shell of the victim.

But for some of the hermit-crabs there is a stranger possibility. A polyp called the *Epizoanthus americanus* may attach itself to the inhabited shell. The base of the polyp will then gradually expand

A PARASITE.

ZOEÆ OF ROCK-CRAB.

carries all its eggs in one basket, which forms part of the wreath. The nautiloides is one of the "finds" of the Fish Commission. There is evidently room for an essay on the possibilities of worms. The *Cirratulus grandis*, for instance, is a large worm, furnished with an immense quantity of long, flexible, red or orange-colored cirri, that spring from its sides. Its power to curl these cirri tightly down to its body when disturbed gives to it at such times an entirely changed appearance; it is as if a long-haired Indian should suddenly frizzle like a negro.

The student of sociology should take an interest in *Autolytus cornutus*, although it, too, is only a worm. It is of three genders, male, female, and neuter, the three differing much in appearance. The asexual individual is hatched from the egg, the mother dying soon afterward. This neuter grows to a considerable size, till it has forty to forty-five segments. Then, somewhere about the thirteenth segment, swellings arise, which become a head, eyes, and tentacles. The rear segments proceed to develop various appendages, and assume the male or female form. Finally, the new animal, thus constituted, male or female as may happen, breaks off from the upper segments and swims away. This worm has some peculiarities, more largely developed in other members of its class, that have a military bearing. The mature animal has perhaps a hundred bundles of fascicles at the sides, which become weapons of offense,

differently developed in different species. Taken together, they are a perfect armory. Barbs, straight and spiral, Arkansas tooth-picks, lances, spears, swords, sword-bayonets, and even the three-sided bayonet of modern warfare, are represented among them. These can be detached by the animal, with apparently some force. They inflict great irritation upon the human skin if the worm is incautiously handled.

We can but glance at the new *Octopus* named after Professor Baird. This is the male, and there is good reason for believing that the female is of far greater size, although she has not yet been identified. It is a curious fact that the males of these sea-monsters are comparatively diminutive. The cap-

tures of this particular octopus are rare events, and the Fish Commission has the honor of all of them. Now that the huge cuttle-fish of the Bay of Fundy have proved to be realities, great interest attaches to new varieties of the devil-fish. The octopus seems to swim partly by a motion of his arms, but principally, like his kind, by means of his siphon, which is capable of adjustment in any direction, and by forcibly expelling water from it he goes forward, backward, or at any angle.

Before leaving the laboratory it is worth while to take a look at the parasitic animals. The large fishes have each a special assortment of parasites, external and internal, some loosely attached, some burrowing deep in the tissues and sucking the juices of the animal. Of the last is *Lernæonema radiata*. The female is larger than the male, and resembles principally an animated pair of tongs; but what would naturally

MEGALOPS OF ROCK-CRAB.

pass for legs are really the ovaries. She burrows head-first into the exterior and gills of fishes, and lives by sucking their blood. Her choice is menhaden and alewives.

In all these researches among invertebrate animals, Professor A. E. Verrill, of Yale College, has taken the lead, and there are innumerable newly ascertained forms of life to which he has stood godfather, among them several which have been described. To his courtesy and assistance the writer is largely indebted. But, in fact, all the gentlemen of the Fish Commission seemed to reflect the good nature of its chief officer. Certain naturalists had their specialties. Professor S. I. Smith, of New Haven, took to crabs, lobsters, and the like, and added largely to the previous stock of knowledge. In the earlier stage of existence after hatching the crab, lobster, etc., are known as zoëæ. The microscope is required to see the zoëa of the rock-crab (*Cancer irroratus*) to advantage. We find he has a pair of immense black eyes, finely reticulated, and making a great show, because all the rest of the animal is transparent. The head is furnished with long spines, one like a horn on top, the other like a tusk in front. The zoëa represented in the engraving is old, that is, for a zoëa. He has probably moulted several times, and is about three-sixteenths of an inch long. His motions begin to be sluggish, as if something were the matter. Suddenly he is seized with violent convulsions; his skin splits, and he wriggles out of it, no longer a zoëa, but a megalops. He looks now remotely like a crab, but with marked zoëtic characters. As a megalops he swims about for a few days, probably a much shorter time than he did as a zoëa. Then he is again seized with a spasm, not so severe, but equally effective; his skin splits, and, presto! we have a rock-crab.

An important deduction is the result of this knowledge. The story of this crab is true, with unimportant variations, of the entire crab kind. The young lobster is a free-swimming zoëa, and afterward a megalops, before he takes to doubling up his body, and moving forward by jumping backward. So that people who in past years expended thousands upon thousands of dollars in constructing pounds to breed lobsters in, simply threw their money into the sea, since the young lobster could readily swim out through the apertures which admit sea-water into an ordinary fish pound. Mr. Seth Green, the Commissioner of Fisheries for the State of New York, has been among the first to recognize this fact, and make the new knowledge of service. He issued a circular a few months ago, suggesting that to make a lobster pound

VERY YOUNG LOBSTER.

Side view, and dorsal view; a leg, and an antennula, much enlarged.

efficient it should be lined with close wire netting.

That is a single instance; but it is impossible in a brief article to give even an outline of the valuable results already achieved by the United States Fish Commission. Many of its benefits are indirect, and will not be immediately perceptible. If it had accomplished nothing else but to excite a popular interest in fish-culture, and arouse State action in all parts of the country in regard to the preservation and increase of the fisheries, its value would have greatly exceeded its cost. But it has done far more. It has been the means of a vast and permanent extension of the field of knowledge. More has been ascertained about the structure, habits, and specific food of the dwellers in the sea within the last few years than in all the centuries before.

The decrease of fishes fit for human food in the waters of the United States has been fully substantiated. It has been proved that this is not occasioned by a deficiency of the invertebrate animals on which they directly or indirectly feed. It is not in any great measure due to pollution by factory waste. It does not arise from changes in the habits of ocean fishes beyond man's control. To prevent it, and repair the present deficiency, there will be no need of stopping any great branch of industry, such as that of net-fishing. The main cause of the depreciation of the fisheries is an indiscriminate use of the net during spawning season, supplemented by the voracity of the bluefish. The prevention of the use of nets during about one-third of each week in spawning season, with the good results to be expected from artificial fish propagation, will in a few years restore the prosperity of our sea-coast; and we may reasonably hope ere long to see the best of fish among the cheapest food upon our tables.

A GLIMPSE OF "SEVENTY-SIX."

FEMALE COSTUME OF '76.

AS the one hundredth anniversary of our national independence draws near, the thoughts of our people are eagerly turned, not so much to a consideration of the well-known principles which were then established, as to a more familiar observation of the men and women who were the actors in that great event. We are curious to know what manner of folk they were; to take note of their appearance, manners, and customs; to cross their thresholds and see what they ate and drank and wherewithal they were clothed, and what entered into their domestic appointments and belongings; to estimate their character, and to learn the details of the story of their privations, their endurance, their sufferings, and their heroism. We desire to fix in some permanent form the memories which a rapidly dissolving tradition has handed down, and of which so few living repositories remain; and, before it is too late, we would rescue from decay or destruction the few perishable unpublished records which, however faintly, serve "to hold the mirror up to nature," and "to show forth the very age and body of the time, his form and pressure."

Perhaps there is no process by which this can be done more successfully than by concentrating attention upon some representative portion of either one of the "Old Thirteen." Just as, if we would preserve for the

men of a hundred years hence a correct notion of the men and times of to-day, we would strive to reproduce for their inspection a faithful interior picture of any one of our ten thousand villages, towns, or counties. One is so exact a counterpart of another in all that relates to manners, customs, and social, political, and religious surroundings, that if a correct representation could be produced of any single one of our communities, it would be a striking and accurate likeness of every other member of our national family.

Remarkable, however, as is this similarity, still greater

was the resemblance of the several parts of the "Old Thirteen." Their uniformity had as yet been very little affected by the foreign admixture which is now so remarkable and in some respects so disturbing an element of our national condition. With slight shades of difference, the character, habits, usages, and the modes of thought, feeling, and action of the people who, during the ante-Revolutionary and Revolutionary times, were scattered along the seaboard from Massachusetts Bay to Georgia, were those of a homogeneous people. They shared the same political and religious aspirations and convictions; their habits, manners, and tastes were similar; they were exposed to like vicissitudes, and suffered identical calamities; and they manifested the same endurance, perseverance, resolution, and other traits of character. So that one of them was an epitome of all.

Placed in the geographical centre of the original States which were the germ of the Union, the people of New Jersey at this period united in an unusual degree the conditions requisite to the production of a faithful daguerreotype of our ancestors. They were free from the exceptional, and often transitory, local singularities or peculiarities of those living in the two extremes, and they shared those more numerous traits which formed the permanent substratum common

to all. New Jersey was the highway of intercommunication by land between the other States, and there was constant social and commercial intercourse between its people and those of New York and New England on the one side, and those of Pennsylvania, Delaware, Maryland, and Virginia on the other. Its eastern division, known as East Jersey, was largely peopled by settlers from New York and New England; and its western division, West Jersey, by those from the adjacent colonies on the west and south. It derived its tobacco and many of its domestic fruits and vegetables from Delaware, Maryland, and Virginia; its Quaker tenets, its phlegm and frugality, from Pennsylvania; its Dutch cupboards, Dutch language, and sturdy Dutch Calvinism from New York; its jealous watchfulness for popular rights, its town-meetings, and much of its assorted variety of religious faiths, from New England; and so blended the features of the other colonies into a harmonious mean as to form a fair microcosmic representative of them all. In addition, when it is considered that whatsoever the other colonies suffered from the presence of the British armies, from sanguinary and decisive battles, and from the rapine and desolation of war, was also suffered by the people of New Jersey, it will not seem inapposite to select that State for the scene of our historical sketch, which, *mutatis mutandis*, may serve for either of the sister commonwealths.

The latter part of the year 1776, when the

British overran New Jersey, was one of the darkest hours of the war of the Revolution. No aid had been received from France, and as yet was hardly hoped for. A portion of the people there, as elsewhere, sympathized with the invaders, and the patriots were every where exposed to their hatred or cupidity, and were in constant dread of their treachery. Neighbor suspected neighbor, friend distrusted friend, and even fathers and sons ranged on opposite sides. Trade and industry were paralyzed. The husbandman hesitated to plant a crop, or, if he did so, confined his labors to the production only of what was absolutely necessary for the bare subsistence of his family. The precious metals had vanished from the land as the armies of the king swept triumphantly along, and the paper money had little more value than the brown forest leaves of that bitter autumn. The means of the patriotic side were almost exhausted, and in many cases their hopes were entirely so. They had responded again and again to the calls that were made upon them for men and other material aid, until none but old men and women and children remained at home; and their houses and barns were gleaned of every superfluity, and even of the necessities of life.

An illustration is furnished of the doubt and suspicion which prevailed, and of the summary modes that were resorted to by the patriots to intimidate the disaffected Tories, by a letter written at the time from New

INTERIOR OF ROOM—WASHINGTON'S HEAD-QUARTERS AT NEWBURGH.

JUVENILE PATRIOTS OF "SEVENTY-SIX."

Jersey by a British officer to a friend in England, which we find in *The Scots Magazine* for 1776. "Every thing," he says, "is transacted by the Committee [referring to the Committee of Safety appointed by the Provincial Congress], which is composed of barbers, tailors, cordwainers, etc., whose pertness and insolence would raise any Englishman's indignation, for the better sort endeavor to keep their own necks out of the halter, and make use of these fellows as cat's-paws. One of our friends had got several thousands in the back country brought over to our interests; but about a month ago a mob of about one hundred dissolute fellows surrounded his house, with an intention to tar and feather him; upon which he came out armed, and while he was reasoning the case with them at the door he was knocked down with the butt end of a musket, then laid like a calf across a horse, and tied to a tree while yet insensible, and tarred and feathered."

Another instance is related by still another British correspondent, who quotes from a "rebel newspaper," as follows: "At Quibbletown, in Middlesex County, New Jersey, Thomas Randolph, cooper, who had publicly proved himself an enemy to his country by reviling and using his utmost endeavors to oppose the proceedings of the Continental and Provincial conventions and committees in defense of their rights and liberties, and he being judged a person of not consequence enough for a severer punishment, was order-

ed to be stripped naked, well coated with tar and feathers, and carried in a wagon publicly round the town, which punishment was accordingly inflicted; and as he soon became duly sensible of his offense, for which he earnestly begged pardon, and promised to atone for as far as he was able by a contrary behavior for the future, he was released, and suffered to return to his house in less than half an hour. The whole was conducted with that regularity and decorum that ought to be observed in all public punishments."

A glimpse is given of a still different

form of "public punishment" inflicted by the indignant patriots on their Tory neighbors, in another letter of an officer in the British army, printed in *The Scots Magazine* for October, 1776. Under date of August 17, 1776, he writes: "The persecutions of the loyalists continue unremitting. Donald Maclean, Theophilus Hardenbrook, Young Feuter, the silversmith, and Rem Rappalge have been cruelly rode on rails—a practice most painful, dangerous, and peculiar."

Even the boys shared the sympathies and antipathies of their fathers, forming themselves into bands for "liberty" on the one side, and the "king" on the other, which resulted in innumerable blackened eyes and broken heads. I have heard my grandfather, the late Jacob Dunham, M.D., of New Brunswick, New Jersey, relate that when he was a lad of eight or ten years old, and went to school in that place, his preceptor, much to the disgust of the great body of the scholars, was a loyalist, and outspoken in his disapproval of the "irregular" proceedings of the Whigs. The boys, imitating the spirit of their elders, determined on a "public punishment" suitable to school-boy ideas of justice. Overawing into silence the few of their comrades who sympathized with the "master," they prepared a large placard, on which they printed in huge letters the obnoxious word "TORY!" and seizing the opportunity of the dismissal of school at noon, they stealthily pinned this upon the teacher's back, who, unobservant of the trick, walked

down the street to his house, followed by the boys marching in procession behind him at a safe distance from his cane, and pointing out to the passers-by the label with which they had adorned him. This school-boy trick led to the dismissal of their preceptor from his position and the breaking up of the school, to the great satisfaction doubtless of the youthful patriots.

There is no doubt that the "Tories" had hard lines measured out to them by the "Whigs." If persons were known or suspected to be "disaffected," to have "spoken disrespectfully" of the Provincial or Continental Congresses or of the Committee of Safety, to have encouraged opposition to the laws and regulations that were set forth by either of these bodies, or to be engaged in stimulating gatherings or uprisings against the Revolutionary authorities, they were promptly reported to the Provincial Congress, or, in its recess, to the Committee or Council of Safety, when they were speedily arrested, examined, confronted with their accusers (who were oftentimes of their own kin), and if specially malignant were confined in jail, or if repentant were required to take the "oath of allegiance" and to give bonds for their behavior. In numerous instances they and their families were driven into the lines of the enemy with whom they sympathized, and their property was confiscated or suffered to run to waste. But none of them were subjected to other violence or were put to death by the Revolutionary authorities in New Jersey. And although occasionally an innocent man may have suffered through the accusations of vindictive personal enemies, in the main there was ample confirmation of the charges brought against them, and they were allowed a fair and full hearing before men who were carefully observant of the rights of others and of the forms and safeguards of law, and whose decisions appear to have been singularly dispassionate, deliberate, and equitable.

The Tories, on the other hand, retaliated with alacrity whenever they had an opportunity. When the British army made its appearance in a neighborhood, they industriously pointed out those who were identified with the party of liberty. They maliciously led them to the spots where the patriots had concealed their property and valuables, and aided them to pillage or destroy them. The most of the foraging parties of the enemy were accompanied by them, and nothing escaped the keen sense of their hatred or revenge. As was naturally to have been expected, they exhibited the greatest bitterness, and many of their acts were marked not only by meanness and cupidity, but also by treachery and brutality.

Immediately after the battle of Long Island, which was followed by Washington's evacuation of New York, the storming of

Fort Washington, with the loss of 2000 men, and the evacuation of Fort Lee on the 18th of November, 1776, the American army retreated across New Jersey, too weak to make a stand at any point, and so completely bereft of all means of defense as to be without a single intrenching tool. It was followed by the British army, so closely that the music of the one army was heard by the other, which rapidly spread itself over the entire central, wealthiest, and most populous portion of the State. On the 28th of November Washington retreated to New Brunswick, and on the same day the British entered Newark. During the few days that Washington lay at New Brunswick, before he was again forced to flee, a large portion of his army had become entitled to their discharge, and it was impossible by any remonstrance to detain them. They abandoned the cause of their country in the hour of its supremest need, and left Washington almost powerless to flee. On the 2d of December, as the British advance-guard showed themselves at the opposite side of the bridge, Washington evacuated New Brunswick, retreating through Princeton to Trenton, and the British occupied the place.

The gloom which hung over the country, and which in an especial degree enveloped that part of New Jersey, was now at the blackest. No ray of light penetrated the darkness. The protracted campaign had been marked by rapid and overwhelming disasters. The whole country was in possession of the British soldiery, who insulted and preyed upon the people. It was now reported, and the report seemed so probable as to be generally believed, that the Continental Congress was about to disperse and abdicate its powers. Every thing seemed to be irretrievably lost. At this profound crisis Lord Howe, the British commander, issued a proclamation offering a full pardon to every person who would, within sixty days, subscribe a declaration of submission to the royal authority. Timed as was this proclamation when every thing seemed lost, it was taken advantage of by thousands who had hitherto espoused the cause of independence, and who now flocked daily to make their peace with the invaders and obtain their protection. For ten days after its publication two or three hundred persons a day came in to Lord Howe at New Brunswick to renounce their adhesion to the patriots and to take the oath of allegiance to the British crown, embracing in their number many persons of consequence and influence, among them being Samuel Tucker, of Trenton, who had been a delegate to and president of the Provincial Congress. His defection was a cruel blow. The people felt that one of their earliest and most trusted leaders had abandoned them, and knew not who next would follow.

MUSKET, SWORD, OUTLASS, AND BULLET-MOULD.

A close view of the condition to which the patriots of New Jersey were reduced at this period of the war—the counterpart of which existed throughout all the colonies—is afforded by a curious relic, to which public attention has never been invited hitherto, and which is of great historical value, not only as exhibiting the outrages to which our ancestors were subjected and the hardships they endured, but also as illustrating their social surroundings with conspicuous minuteness and fidelity. This venerable relic is a “Record of the Damages done by the British and their Adherents to the Inhabitants of Middlesex County,” in New Jersey, which is preserved in the New Jersey State Library. It is in the form of a bound folio manuscript volume, of between three and four hundred pages, and it contains the inventories rendered by over six hundred and fifty persons, whose property was plundered or destroyed by the British from 1776 to 1782 inclusive, but mainly during the six and a half months beginning with December 2, 1776, and ending with June 22, 1777. Each inventory is entered in this volume in detail, with the valuation of every article annexed, and is certified to under oath or affirmation by the person damaged or his representative, before one of the appraisers appointed by the State for that purpose. The authority for these inventories was an act of the Legislature—the bill having been originally offered March 8, 1780, when it was lost—which was passed December 20, 1781; and they were made, as the preamble to the act recites, in the expectation that the losses would be reimbursed by the State, as they afterward were in some of the other colonies. In New Jersey the losses never were reimbursed; and the only fruit of the labor is a microscopic record of the injuries sustained by its patriotic sons, and a vivid picture of their sufferings, their social manners, their dress, furniture, household utensils, luxuries,

etc. By the act under which these inventories were made, two separate “Registers of Inventories” were ordered; one of the “property damaged or destroyed by the Enemy and their Adherents,” and the other of “the property damaged or destroyed by the Continental Army, or by the Militia of this or of the neighboring States.” It was further provided that there should be three appraisers for each county, whose duty it would be to value and appraise the articles inventoried at the prices current in 1775; that the inventories should be certified to on oath or affirmation; that nothing was

to be admitted in the inventories for which “any restitution had been made or satisfaction received;” that no inventory should be received from persons of a suspicious character, or who failed to substantiate that they had been “friends of the government established under the authority of the People;” that forged or feigned inventories would render their utterers liable to severe penalties; that the losses sustained by “Privateers or Vessels of War, Merchant Ships, or Trading Vessels, their tackle, furniture, or Cargo, from the Enemy,” were not to be admitted to inventory; and that the appraisers should each receive as compensation for his services “seven shillings and sixpence by the day.”

In conformity with the act the inventories that were presented were sworn to by the claimants before at least one of the appraisers, the usual form of the affidavit being, “John Doe declares on oath that the above inventory is just and true to the best of his knowledge. That he has not received any satisfaction for any of the articles therein contained. And that he hath good reason to believe that the above articles were taken, carried off, and destroyed by the Enemy.” When *personal* property only had been plundered or destroyed, the affidavit of the party injured, or of his representatives if he were dead, was all that was required. But when a claim was made for *real* property burned or damaged, in addition to the oath of the claimant another was required from one or more carpenters who had “viewed” the premises and estimated the loss, and was usually in this form, “John Doe and Richard Roe, being carpenters, declare on their oaths, that they knew the buildings of John Smith, which were destroyed by the Enemy, and do adjudge the damages to the amount of £235.0.0, to the best of their knowledge.” Ordinarily, when *several* buildings were destroyed, the affidavit of the expert comprised

a detailed valuation, as follows: "John Doe, being a carpenter, declares on oath that he knew the buildings of Richard Roe, as destroyed by the Enemy, and Judge the value of them as follows, to wit, Grist Mill £200. Saw Mill £50. House, Slaughter do., and Smith Shop £30, and y^e other House and Barn £110." If a building was only damaged in part, the form varied, as follows: "John Doe being sworn saith that he in conjunction with Richard Roe, being called upon to view the damages done the buildings of John Smith, and having viewed the same, do adjudge the said

damages done to said buildings to y^e am^t of £19.0.0, to the best of their knowledge." Where woodland was destroyed, a third party was called in to estimate the loss, and his affidavit was annexed to the inventory. When valuable horses were carried off with other property, the oath of the claimant was supplemented by the affidavit of a neighbor, which almost invariably ran in the following form: "John Doe declares on oath that he was knowing to the Enemies taking and destroying the articles contained in the above inventory of John Smith. And that he personally knew the said horse, and do adjudge he was worth £15."

During the time when the depredations recorded in this old MS. were made the sufferings of the Jersey Blues in the vicinity of New Brunswick were intense, and their destitution deplorable. A cold and boisterous winter, which had set in with unusual rigor, lingered in the lap of May. Numbers were forced to flee from their homes during this inclement season, leaving their families without protection or support, and were either in hiding or wanderers in a desolated country. A hostile and insolent soldiery occupied their towns and villages, and harried their houses and farms with oppressive exactions. Their horses and cattle, their flocks and herds, were stolen; their stores of hay, flour, corn, bacon, and provisions were plundered; their houses, stores, mills, barns, and fields, and even their churches,

OLD FIRE-PLACE.

were burned or devastated; their household goods were spoliated and carried away; their wives were maltreated and insulted, and they were despoiled of their clothing, rings, trinkets, and even of the cradles in which they rocked their infants to sleep. Nowhere was there to be found any alleviation of their distress, nor could any prospect of its termination be descried. And yet, amidst all this desolation, rapine, and insult, and perhaps because of them, the people of Middlesex County and of the town of New Brunswick remained steadfast to their apparently ruined cause. Here and there a few became "adherents of the enemy," as they were opprobriously styled, but the great body were stanch "patriots." The journals of the "Committee of Safety" and of its successor, the "Council of Safety," give the names of over one thousand persons in New Jersey who were disaffected, and were required to give bonds and take the "oath of allegiance" to the Revolutionary authorities; but of this number, notwithstanding the overshadowing influence of the British army, which was quartered on it nearly seven months, only twenty-six were inhabitants of Middlesex County. Besides, it furnished over fifteen hundred soldiers to the State and Continental military establishments. And on a subsequent occasion, when Sir Henry Clinton was about to march through the State just before the battle of Monmouth, and needed guides for his army, he applied for them to Colonel Simcoe, whose "Ran-

gers" were largely made up of "refugee" Jersey men. But although this dashing partisan had a book in which "was inserted the names of every soldier in his corps, the counties in which they were born and where they had lived, so that he was seldom at a loss for guides," he was obliged to reply to Sir Henry that "he had none who knew any of the roads to New Brunswick," which could not have been the case if he had had any from Middlesex County in his corps. In his "Journal" Colonel Simcoe on several occasions refers to the "vindictive spirit" uniformly exhibited by the people of this county toward the British, and describes them as "most virulent in their principles," and as "attacking from their coverts the British foraging parties in 1776, and insulting their very outposts," adding that they had thus "acquired a great degree of self-confidence and activity."

The British occupied the town of New Brunswick and its vicinity (including Six-mile Run, Middlebush, Piscataway, Bonhamton, and Woodbridge) from December 2, 1776, till June 22, 1777. During their stay they levied severe contributions upon all who espoused, or were in any way connected with those who espoused, the side of independence; and their outposts and foraging parties pillaged the people without mercy. Within this brief period of six and a half months the old book of inventories shows that the British spoliated 664 persons, and burned over 100 dwellings, mills, and other buildings within the limits of Middlesex County; and it is probable there were others that are not recorded. The assessed value of the property thus destroyed, as given in the old relic we are considering, was £86,214, which, counting eight shillings to the dollar, and considering that one dollar in 1775 was equivalent to three dollars at this day, was equal to a total of \$646,605 of our present currency. The severity of this loss may be more clearly estimated if it is borne in mind that the total population of the county in 1775 was about 12,000. If from this number are deducted 1300 negroes, and 700 adult white males who were not heads of families, the population over whom all this devastation was distributed did not exceed 10,000, of whom only one-fifth, or 2000, were householders. So that one out of every three householders was pillaged, and one in twenty had a house burned.

We are shown by this old record that in the forays which were made by the British during this time the dinner prepared by the family was often ravished from the table, especially by their auxiliaries, the Hessians, whose avidity for plunder and brutal outrage drew upon them the execrations of the people. No regard was paid to age or sex. Even articles of female wear—indeed every thing, however minute, which had any val-

ue—were swept into the capacious maw of these rapacious mercenaries. Again and again the people were required to furnish meals for large parties of Hessians and forage for their horses, and the demand was enforced at the point of the bayonet. On one occasion a party of thirty of these marauders quartered themselves upon a single family in the town of Woodbridge, demanding breakfast and supper. The cowardly plunderers usurped the seats of the family at table, forced them to wait upon them, and not content with this indignity, drank or stole twenty gallons of rum, five gallons of brandy, and a barrel of cider which the goodman of the house had stored in his cellar in brighter days; and when they departed they robbed his wife of her store of stockings and the blaukets from her beds, and drove off his three cows and his "fine eight-year-old mare."

Some of the affidavits annexed to these inventories afford us familiar glimpses of the people of that period, their personal characteristics, their vicissitudes, and the straits to which they were reduced, and present sharply outlined pictures of the dismay that attended the inroads of the enemy. One of the plundered patriots testified that he was away from home at the time, and on his return he "found his wife in great distress, who is since dead, and who told this deponent that about forty Hessians had the night before quartered in their house, and had gone away very early in the morning, which was December 7, 1776, and that all her bedding and sundry other things had been plundered and taken away by them." Another prominent and wealthy patriot, a merchant named John Dennis, had distributed a large part of his property among various persons in New Brunswick and the adjacent country, in the hope that it might escape the notice of the enemy. Among other things he sent "sundry trunks, barrels, etc.," containing valuable goods, to the farm-houses of some friends in Piscataway, who secreted a part of them in their cellars and barns, and a part they buried beneath a stack of buckwheat; but the enemy, guided by some sure intelligence, discovered and conveyed away or destroyed the whole. This gentleman presented ten different inventories of as many different lots of valuables, amounting to a large sum in the aggregate, which had been distributed in different places, and all of which were plundered. Among his other losses were several sloops and schooners, one of which, the *General Lee*, was taken by the British, and her master "was compelled to carry her to New York." Mr. Dennis's affidavit concerning this vessel contains a touch of grim humor, and is as follows: "John Dennis declareth on oath that the above schooner was taken by the Enemy and their Adherents, and that he this deponent saw said schooner in the hands of the Enemy, in

Perth Amboy harbour, when he was put on board a boat as a prisoner to be conveyed to the Provost Gaol in New York. He further declareth that he never hath received one farthing as a recompense for no part of the same, excepting one year's close confinement in a loathsome Gaol, and further saith not."

The march of the British through Woodbridge and Piscataway to New Brunswick in November, 1776, and on their retreat through both to Perth Amboy in June, 1777, was marked by devastated and burned dwellings and other buildings, two hundred and forty-four persons having been plundered, and forty houses, mills, barns, etc., burned in Woodbridge, and one hundred and thirty-one persons plundered and thirty-one buildings burned in Piscataway. The affidavits accompanying the inventories fairly place us in the light of these burning houses. Thus Thomas Edgar bears witness "that on or about the last of June, 1777, he saw the house late of Samuel Parker as above mentioned, in flames, a-burning, immediately after the enemy passed it, and that he verily believes they set it on fire." Hiram Frazee testifies "that he saw the house of Thomas Force on fire, and see at the same time a number of people at the said house, which he took to be British troops, as they then [November, 1776] was a-passing along the road." And, again, Phineas Randolph testifies that in December, 1776, he saw "the new, two-story, well-finished house of Justus Dunn a-burning, and at the same time a number of the enemy around it, and have good reason to believe they set it on fire and burnt it." Numerous instances of this kind might be cited, but these will suffice. One notable fact runs through them all, namely, that those whose property was the most ruthlessly pillaged or devastated were the most confirmed and active patriots.

The plundering of their horses and cattle entailed heavy losses upon the men of "Seventy-six," the number carried away or killed within the limits of the single county of Middlesex having been over 1800; and the affidavits accompanying the inventories show that in many cases this particular business was inspired or conducted by refugees and Tories, who knew where to lay their hands on the most valuable and serviceable animals, and who could thus wreak their revenge or retaliate their wrongs on their old neighbors and acquaintances. The enormous destruction of fencing and of growing or gathered crops was another serious item. In numerous cases not a panel of fence was left standing, and every rail and post was consumed for fuel by the pickets and outlying parties of the enemy, while the entire crop of grain and hay was carried off, fruit trees and orchards were hacked down, the woodland was ravaged, and the thriftiest

farms were converted into a ruin of desolation, some of the latter having been revisited and plundered six or eight times. To add to the indignities that were heaped upon them, the people were often "pressed" by the British into the work of carting away the property and valuables of their neighbors, and many were taken captive, and, together with their horses, were held to ransom by the enemy.

A very clear view is afforded by these inventories of the honest exactitude of the men of that period; and, as we have before remarked, their infinity of details furnishes a faithful illustration of the social surroundings, the dress, food, and the household goods, the elegances, conveniences, and necessities, the implements and ornaments and the manner of life, of those times. A few examples of the most curious of these, selected from among more than two hundred whose losses are noteworthy for some peculiarity, are herewith presented:

Thus Moses Bloomfield, of Woodbridge, who was a private soldier in the New Jersey militia, was plundered on five different occasions, and among his losses he recounts "32 shirts, part homespun and part bought linen," together with "2 pair of silver knee-buckles, a silver stock-buckle, and 3 large new silver spoons." Cornelius Baker, of the same place, chronicles the loss of "a new pair of velvet breeches, three large silver shoe-buckles and one silver knee-buckle, forty gallons of rum, brandy, and gin, and £10 in cash, the greatest part hard." Isaac Cotheal, another Woodbridge patriot, was not only carried off himself, together with his "negro boy, 12 years of age," but the marauders stole his silver watch, which he declares was "good and cost £8.10," and, in addition, a "new pare of Leather Britches and 6 pare of Ankeen and Drilling ditto, new; a dozen new shirts, a dozen pare of stockings, and 6 Wastcoats of Ankeen and Striped Silk, good." John Chamberlain, of Windsor (a township in which Princeton was situate), is one of the very few who are dignified in these old inventories by the title "esquire." Nevertheless he was only a private in the Middlesex militia. He was twice plundered, the first time of "cash and a watch," and the second time of "£1000 Continental money (appraised at £15.13.4), 3 Silver Shoe Buckles and 3 do. Stock do., $\frac{1}{2}$ dozen Teaspoons and 3 pair of silver Sleeve buttons," besides "1 Gun and Bayonet, 1 pound of powder, and 1 or 2 pounds of shot and 2 powder horns," and "21 Shirts." Perhaps this last item caused him to rank with the squirearchy of the day. John Conger, of Woodbridge, another private in the Middlesex militia, is another of those marked by the rare title "esquire," although there is no evidence in the book of inventories that he had ever been the possessor of as many

shirts as his brother patriot Chamberlain. He was, however, a well-to-do person, and had stored in his cellar "4 Hogsheads of Cider, $\frac{1}{2}$ Pipe Madeira Wine, 10 Gallons Brandy, 7 Gallons Jamaica Spirits, $\frac{1}{2}$ Barrel of Cherry Rum, and $\frac{1}{2}$ of a Barrel of Porter." These were sufficient, perhaps, to entitle him to rank as an "esquire," unless he derived the title from the exercise of the then dignified and eminently respectable calling of an innkeeper. Be this as it may, the enemy imbibed or carried away his liquors, and then gave evidence of their potency by destroying his barn, damaging his house, tearing down and burning the fencing around his garden and farm, and finally by smashing "50 panes of glass" in his windows. Benjamin Dunn, of Piscataway, another patriotic private, was a very heavy loser, his inventory footing up over £700. Besides his horses, many head of cattle, and a great store of grain and hay carried off, "650 Trees and Saplings cut down, 200 acres of land mowed and pastured, Firewood cut and drawn for 2 large fires and one small one for 5 months, and 5378 rails and stakes destroyed," he recounts the loss of "1 Stout Negro Man 30 years of age £100, 1 Large Looking Glass 3 by 2 feet broke £8," his "gun, cartouch box, bayonet, and 3 cutlasses," and his valuable library consisting of "2 Books—Salman's Gazetteer and Harry." Jonathan Deare, of Princeton, a lieutenant-colonel and a prominent lawyer, suffered a full sweep of his household goods, orchards, and cellars. Among the former were a "number of Law and other books value of £40," and among the latter "one hamper of wine in bottles, 6 dozen," evincing that his pillagers were of a studious as well as of a convivial turn of mind. John Platt, of Woodbridge, was very thoroughly despoiled, special attention having been paid by the enemy to his store of women's clothing and bedding. Amidst a multitude of caps, aprons, gowns, and other articles of female wear, he laments the loss of "one pair of stays, as good as new," and of "one common Bible, one good Rifle, and a Bullet-mould"—an odd admixture of weapons spiritual and carnal. William French, of Piscataway, was a Middlesex militia-man, and was completely "cleaned out." The enemy burned his two dwelling-houses, store-house, barn, and smoke-house, carried off his horses, cattle, sheep, wagons, sleds, pleasure sleds, grain, and hay, and robbed him of his household goods and farming utensils. From the massive character of many of the articles in his inventory, which could have proved only useless impediments to the marauders, it is inferred that they must have been wantonly consumed with his buildings. Of this character was that favorite article of furniture with our ancestors in the Middle States, "three Cupboards of Dutch make, equal to new." In this inventory were also "three

swords and one gun and bayonet good," and "three Bibles, one large dutch, y^e other English worth £2.11.6"—so that this patriot had a Bible for each sword, and was doubtless equally a man of prayer and of war. Henry Guest, of New Brunswick, was a tanner, and was effectually carried by the enemy. In his inventory is an item of "122 Slaughter Hides from Fort Lee," which just afterward capitulated to the British. This item revives the recollection of an incident of the Revolution which I have heard related by my grandfather. The British had erected a fort on the east bank of the Raritan, opposite New Brunswick, hard by the county bridge, which overlooked and commanded the town. From this fort they were expecting the approach of a body of American troops by way of the road from Trenton and Princeton, and were vigilantly on the look-out. One night Mr. Guest, whose tannery was on the extreme westerly bounds of the town, at the intersection of what is now Livingston Avenue and New Street, put out a large number of hides to dry—possibly the identical ones above named—hanging them on his fences. When the sun rose next morning, the British mistook these hides for the long-expected "rebels," and opened a brisk cannonade across the river upon them. But the fire made no impression on the foe, who held their position with the greatest firmness and good order. No British veterans were more unflinching than they, and the matter began to wear a serious aspect. It was not until spy-glasses were brought to bear upon them that it was discovered they had been spending the fire of their batteries for several hours upon a lot of "recreant" skins. When this was ascertained there was a sudden cessation of hostilities, and the joke becoming widely known, caused great merriment at the expense of the "red-coats" among all good patriots in the town.

The inventory of David Harriott, a private in the Middlesex militia, who was literally stripped by the enemy in November, 1776, gives us a glimpse of the household finery of some of the substantial men who made up the patriot army. Among the innumerable articles belonging to him which they appropriated were a "Set of Homespun curtains wove with damask flowers, one ditto of White in large damask flowers, and one ditto of double dimons." Also an abundant store of napkins, quilts, bed-spreads, sheets, "large flowered damask table-cloths," and sundry linen articles. They plundered his wife of her "long gowns" and "short gowns;" of her "shifts of 5-hundred linen;" of her "petticoats, one of them flannel besides one of damask, new;" of her "handkerchiefs of lawn, gauze, and silk;" of her "aprons of new flowered lawn, striped muslin, fine linen, and homespun;" of her "eight caps of cambric and lawn all new;" and even of "two

diaper bibs for a child." Finally, they stole his boots, his "broad cloth coat," his "velvet Jacket and breeches," and other "unmentionables" innumerable; besides "Cash £6.4.0, his silver teaspoons, silver stock-buckle, and silver sleeve buttons." They smashed his windows and doors, tore up his floors, broke down his partitions, destroyed his grain and fencing, ran off his cattle, and did not leave him so much as a bed, a piggin, a trammel, or a gridiron. John Hampton, an ensign in the patriot army, was another heavy sufferer. Apparently he also was an innkeeper, since among his losses were "60 Galls. Spirits, 40 Galls. Rum, 30 ditto Cherry Rum, 30 ditto Brandy, 15 ditto Cherry Brandy, 60 ditto Madeira Wine, 40 ditto Teneriffe Wine, 40 ditto Country Gin, and 200 pounds of Tobacco." Jacob Hyer, of Princeton, was a colonel, and must also have been either an innkeeper or a fine old gentleman of the olden time, for he notes (and if he were an innkeeper doubtless his guests sorely bemoaned) the loss of "60 Galls. Madeira Wine, 65 ditto Best Claret, 8 Barrels of Hores Best Porter, 30 Galls. Cherry Whiskey, 6 Groce Black Bottles, and 20 Gin Cases and flasks," besides spits, saucepans, bake-ovens, etc., innumerable. Among his multitudinous losses were "5 fluted brass candlesticks, best kind, 2 pair comon ditto, 1 Dozen Iron ditto, and 10 pair of Snuffers, 11 feather beds with bolsters and pillows, 6 pair new slippers," and a great variety of other things betokening a well-to-do and amply furnished household. The enemy left him literally nothing, carrying away even his "Iron Chain for Smoke Jack," and the trammels appertaining. Colonel Hyer seems to have exercised a care for the outer as well as inner man, and was probably a hatter as well as a landlord and a soldier, there being recited among his losses "50 pounds of hatter's wool, carded, 14 Caster and 20 Wool Hats, and a new hat press." The Martin family, in Piscataway, had nineteen of their number in the patriot army, and twenty of that name were more or less severely pillaged. One of them, named William, was the greatest sufferer, having been visited five times by the enemy between February, 1777, and April, 1781. Each time they carried off two or three horses, besides, at their several calls, "7 Geese, 10 fowls, 4 ducks, 3 Guinea fowls, 55 sheep and lambs, and 8 Cows." He makes mournful mention in one entry of two of the luxuries of which he had been rifled, namely, "6 pounds of Tobacco, and 6 pounds of sashes." Another of the Martins records the loss of "one pair of Everlasting Breeches;" and still another, John, laments the loss of his literary collection, consisting of "one Book called the London Art, seventeen shillings and sixpence." John Noe, a neighbor of the Martins, was only a private, but was as ruthlessly harried as if he had been a brigadier.

The British pillaged him on twelve different occasions, taking John himself away at one of their visits, together with every article of clothing belonging to himself or his family, and "One Negro Man named Fenox [query, Phoenix?], aged 30 years, £80."

Samuel Parker, of Woodbridge, was a printer, as was also his father, James Parker, who printed the *Votes and Proceedings of Assembly* from 1768, and perhaps earlier, until 1770. Samuel's widow presented an inventory, one of the items of which is "Part of a printing office and various articles of furniture for the same £25." His "dwelling-house, well furnished," was burned, and a number of things of unusual elegance for the period were destroyed or stolen, among them being "one large Silver Bowl would hold two quarts £20, 1 large Silver Tankard £20, 1 pair of gold sleeve buttons fifteen shillings, 1 ditto garnet ring twenty shillings, 1 Silver Nitten Sheath five shillings, and 1 Silver Whistle for a child to play with seven shillings and sixpence." Thomson Stelle, of Piscataway, was a captain and paymaster of the Middlesex militia. Among other articles, he was robbed of his horses, one of which he describes as a "half-blooded Mare with foal by true Britain £37.10.0." His house was thoroughly plundered, the marauding party which visited him evincing a truly catholic taste, and stickling at nothing from an ox chain to "two pair of leather breeches, one of them half worn." Some of their number must have been addicted to literary pursuits also, as they carried away Mr. Stelle's library, which consisted of "Phillipses Dictionary, Harris Ditto in 2 volumes, and 1 Bound Book of New Jersey Laws." His neighbor, Samuel Walker, a private, was apparently in the tobacco trade, as he inventories among his losses "One Hogshead of Tobacco of 1000 pounds weight £12.10.0, and One Barrel Cut ditto 100 pounds £2.1.8."

An examination of the inventories from which these few selections have been made places us in the midst of the people of those times, introduces us to their houses and fire-sides, and enables us to inspect their social life and manners. From the evidence which they afford it is plain that the men of "Seventy-six" were substantial, thrifty, provident housekeepers, frugal, careful in the sense that Martha was, and believers in the maxims then current—"Many a little makes a meikle," and "A penny saved is twopence clear." As to wealth, theirs was the day of small things, and the solicitude which they showed for articles of little intrinsic value was due to the fact that their possessions were largely composed of such. We are not surprised, therefore, at the frequent record of articles damaged, destroyed, or stolen the worth of which was measured by a sixpence, a ninepence, or a shilling. A paper of pins, a delf bowl, or a pewter dish or platter

KNOT REEL.

was a prime necessary not easily replaced, the want of which we can not duly estimate in our day of lavish and cheap comforts and conveniences. Still a silver thread of honesty and simple integrity runs conspicuously through all the tokens of their provident solicitude. This is apparent in their precise characterization of their several losses, and their evident desire that while they should be appraised at their full worth, they should not be estimated above their value. Hence the frequent recurrence of such qualifying phrases as "new," "most new," "nearly new;" "half worn," "three-quarters worn," "part worn," "little worn," and "much worn;" "the worse for wear," "but little the worse for wear," and "none the worse

WHEEL, CARD, AND REEL.

WOOL WHEEL.

for wear," etc. If a horse or cow was "valuable," they said so; if old or of inferior value, they frankly stated the fact. Nowhere can any purpose be discerned to trick a bargain at the public expense; but their aim seems to have been to exhibit the exact loss they had suffered, and to secure that they should be made whole—no more, no less. Their careful exactitude and honest truthfulness are marked features of all these inventories, and are in refreshing contrast with the unscrupulous disregard of those virtues which signalize kindred documents of our own times.

These inventories reveal that the men of "Seventy-six" were liberal providers, so far as the creature comforts, food and drink and clothing, were concerned. Barrels of pork and beef, "sides" of beef, "flitches" and "sides" of bacon, carcasses of venison

WOOL WHEEL.

and mutton, and dozens of "gammons" and "shoulders" frequently appear as items, in quantities of which we have no experience in these days of abundant shops and markets. The great number of roasting pigs, fowls, turkeys, and geese which are shown to have been pillaged by the British on their advent into New Jersey in November and December, 1776, indicates not only the lavish supply of these that was maintained by our ancestors, but also that they must have been put on short allowance for their Christmas and New-Year dinners in that calamitous year. Besides the meats already mentioned they had pickled and smoked beef and pork, veal, sausages, wild fowl in abundance, and luscious tidbits of 'coon and bear. Shad and herring were plentiful in their season, and were "laid down" by the barrel and even hogshead for winter use. Every household was supplied with butter, lard, molasses, sugar, and honey—the last-mentioned being so common that almost every farmer had his hive or more of bees. Wheat, rye, buckwheat, Indian corn, potatoes, beans, turnips, and beets abounded; and there was a great wealth of apples, cherries, peaches, plums, and pears. For beverages they had tea, coffee, cocoa, and chocolate; also cider and metheglin—the former by the barrel, and even by one, two, and ten hogsheads, and the latter by the keg or barrel; while for those who were not content with these there were brandy, cider spirits, gin, whisky, and rum in all their varieties, anise-seed cordial, cherry-brandy, and wines of all kinds. Nearly every gentleman had in his cellar a liberal supply of these, wine especially being stored by the barrel, or in cases, each containing six or twelve long and high-backed flasks. Tobacco and snuff, too, were in general use, the last-named being greatly affected by the gentry. Tobacco was smoked in pipes or chewed, but was not manufactured into cigars—not a solitary instance appearing in all these inventories of a cigar forming any part of the losses sustained.

The people of those times were respectably clad. Their store of clothing was abundant, many of the fabrics used were elegant, and the fashion of their dress was frequently very stately. Pantaloon were not yet in vogue, but instead there were breeches of leather, buckskin, worsted, homespun, stockinet, black and brown broadcloth, plush, and velvet for winter; and for summer of linen, cotton, nankeen, white dimity, and drilling. Dress-coats, surtouts, and great-coats were made of bear-skin, buckskin, homespun, denim, wilton, broadcloth, velvet, and sagathy (a kind of serge); and cloaks of camlet, broadcloth, and kersey. Their vests were of linen, twilled cotton, diaper, white dimity, serge, broadcloth, and velvet; their gloves of leather and yarn; their hats of felt, castor, and velvet; their shirts of linen,

cotton, homespun, and tow; their stockings of woolen, cotton, and linen. For boots and shoes almost every householder had in his house whole dressed calf-skins and sides of sole and other leather. Such were the materials of which the garments of the men of "Seventy-six" were made; and they bespeak comfort in every case, and dignified respectability in most.

The apparel of the ladies was still more varied, and exhibits their characteristic love of gay colors and delicate fabrics. The assortment presented in these old inventories is fairly bewildering. Judging by them, the ladies of those days must all have considered caps and aprons indispensable to their toilets, the humblest among them having been the possessors of an indefinite number of each, the former having been made for the most part of cambric, taffeta, millinet, gauze, and linen, and the latter of lawn, holland-linen, taffeta, muslin, millinet, down through the gamut to check, homespun, and tow. Their hats, bonnets, and hoods were of beaver, satin, and bright-colored silks and velvets; their cloaks of worsted, broadcloth, camlet, gay-colored silks, white and black satin, purple and black and blue velvet, and especially of brilliant scarlet flannel or cloth. Their dresses were formed of an endless variety of materials. The common short gown, which seems to have been generally affected when they were not in full toilet, was of kersey, holland-linen, worsted, wilton, calamanco (a stuff resembling prunella), check, homespun, and linsey-woolsey. Their long gowns were of check, striped cotton, worsted, striped homespun, calico, "boughten" calico, muslin, chintz, outside chintz lined with calico, white holland, blue and striped holland, black and blue durant (the fabric known as "everlasting"), grosset, bombazine, blue and black russel (a species of linsey-woolsey), moreen, poplin, French tabby, velvet, and of lutestring, white, crimson, and other colored silks and satins. For the hands they wore gloves of thread, knit stuffs, silk, and leather; their stockings were of thread, cotton, muslin, yarn, linen, worsted, and silk; and their shoes were of cloth, prunella, calamanco, leather, and silk. Shawls were of cloth, cashmere, and taffeta; handkerchiefs and kerchiefs abounded in their wardrobes, and were of linen, cambric, taffeta, muslin, gauze, and Barcelona and other thin silks. Of shifts and petticoats their supply was nearly inexhaustible, some ladies recounting the loss of twelve, fifteen, and twenty of each, the former having been constructed of homespun and muslin, but chiefly of fine five and six hundred linen, and the latter of linsey, tow, flannel, kersey, dimity, bombazine, and calamanco.

Equally abundant, various, and serviceable were the articles of household wear of our Revolutionary ancestors. The bed and

HOUSEHOLD GOODS.

all that appertained to it were the pride of the mistress of the house. It was almost invariably of sweet, soft, and downy feathers; its sheets were of fine "homespun," or "five or six hundred linen;" the bed-spreads were mainly of calico, chintz, and "blue-and-white stuff;" the quilts of calico, calamanco, black and blue durant, "green and blue persian," and lutestring; the blankets and rugs of "spotted woolen" and flannel; and the towering posts at either corner of the bed were garnished with snowy curtains of dimity, or with warmer-colored ones of damask, calico, chintz, diaper, "blue-and-white stuff," "homespun striped and wove with damask flowers," and silk. For table use they had napkins of linen and table-cloths of diaper, "diaper-wove huckaback," kersey, and "damask plain and flowered."

The household goods and furniture of those simple times were in strong contrast with those now in use. China was as rare as gold, and as highly prized, most commonly three china cups and saucers comprising the entire outfit of a respectable family, though the number rose sometimes to six, but seldom to a dozen. Cups and saucers and bowls were usually of delf or "queen's-ware." Plates were equally seldom of china, but, to-

gether with servers, dishes, platters, spoons, tea and coffee pots, and tankards, were of pewter, brilliantly polished, and rivaling the richest silver in lustre. Pewter and copper were the ornamental, and iron, then as now, was the serviceable metal. Of the two former were made basins, ewers, mugs, porringers, ladles, and tea and coffee kettles. There was little glass-ware in use, and the few "jelly-glasses," "half-pint and gill glasses," salt-cellars, punch goblets, and tumblers of glass which are enumerated were considered unusual elegancies. Clocks and looking-glasses embellished the houses of the wealthy and genteel, and the size of the latter corresponded with the degree of its own-

er's social standing. Stoves were not in general use, and coal was unknown except for blacksmithing purposes; wood, charcoal, and turf were the only fuel. Wood was just beginning to be burned in "franklins," but generally was used in fire-places, which were provided with dogs and andirons, and in kitchens were huge caverns, garnished with a forest of chains, pot-hooks, and trammels, swinging on iron cranes or "smoke-jacks" over fires that were fed by great logs from four to six feet in length.

The articles of furniture in the ante-Revolutionary households were not numerous. Mahogany was the most costly and aristocratic material; and of it were made their choice chairs, straight and high backed, bedsteads, chests, drawers, stands, tables, and buffets. Few families were without a "dresser" and a "corner cupboard," and the wealthier ones adorned their houses with the stately "Dutch cupboard," made of costly wood, often imported from abroad, and almost capacious enough for a town-meeting. The ordinary furniture of the houses was usually made of bilsted, gnm, pine, walnut, cherry, or red cedar. This last was the favorite, and was applied to every possible use—for pails, tubs, piggins, lye-casks, ta-

PUNCH GOBLET.

bles, stands, cupboards, slawbanks,* churns; and, because of its fragrant odor, as well as from the belief that it was never infested with vermin, was especially appropriated to bureaus, clothes-presses, and linen chests. If few families were without a cupboard, as few were without the large and small wheel for spinning wool, linen, cotton, and homespun, together with the loom for weaving cloth for the various needs of the household. These are rarely absent from any extended inventory.

The men and women of the Revolution had few books, but what they had they valued highly, and mastered thoroughly. Out of the six or seven hundred persons whose losses are inventoried in the old volume from which the above facts have been drawn, only forty-three presented any claims for books that were pillaged or destroyed. This may be due in part to the fact that the British and Hessian marauders attached slight value to books, especially the kind which formed the literary treasures of our ancestors, or that they found them too cumbersome to carry off. The most probable reason, however, was that books were as rare as rubies, and were possessed by a few only. Wherever there were collections of books, a Bible or a psalm-book was almost invariably found in the number, and, indeed, frequently constituted the entire library. As a matter of literary curiosity, the titles of all the books mentioned in the old inventory are here

* A "slawbank" or "slabank" was an indispensable article to every housekeeper in olden times. The name is derived from the Dutch *sloap bank*, or sleeping bench. It was sometimes constructed in the shape of a cupboard, with closing doors, and contained a bed. More commonly it was a box holding the bedding, and was attached to the wall by strap hinges. By day, to economize room, it was folded up against the wall, and at night was let down to the floor to serve as a bed. Occasionally it took the shape of a bench or sofa to sit on during the day, opening by hinges to form a bed at night.

given as recorded, *verbatim*, the quotation marks indicating the library of each separate owner: "One Bound Book of John Milton's Works;" "Two Bibles and 10 other Books;" "One Bible, 1 hymn-book, and some other books;" "1 Small new Bible, 1 Psalm Book;" "The Whole Volumes of the Spectator, Barket on the New Testament;" "2 Bibles and 1 new Dictionary;" "1 Small Bible;" "1 Bible and some other Books;" "1 Book bound with Silver and Silver Clasps and a Silver Chain;" "1 Bible, 2 Sermon books, 1 large;" "2 Common bibles, 1 Testament, 1 psalm book;" "2 Books—Salman's Gazetteer and Harry;" "1 Bible and Sermon Book;" "A number of Law and other books value of £40;" "Several fine books;" "1 Common Bible;" "1 Small Bible, 1 psalm book, and 3 other books;" "3 bibles, 1 large dutch, y^e other English;" "1 Large note-book, 1 Testament, and 1 Spelling Book;" "2 Volumes of Laws Bound;" "1 dutch Bible Silver Mounted;" "1 large chest of Valuable Books of different kinds;" "1 large new Bible;" "1 new Bible;" "Several Valuable books;" "1 Book call^d the London Art;" "1 Case of Books worth £60;" "1 Bible, 2 Small Books;" "1 Very Elegant Bible 4^{to};" "1 Large Bible;" "Considerable part of my Library which contained upwards of 150 Volumes;" "1 Small Bible;" "Phillipses Dictionary, Harris Do. in 2 Vols., 1 Bound Book of New Jersey Laws;" "1 Bible;" "1 Bible, 1 Testament and Spelling Book;" "2 dutch books, 1 day^s psalms y^e other a prayer;" "1 Sclait, 1 Small bible, 1 book y^e y^s mans Com^s, 1 Psalter and Psalm book;" "2 English Bibles, 5 Testaments and 1 Psalm Book, a large quantity of other books;" "1 Psalm book with Silver hooks and clasps;" "1 large Dutch Bible, 1 Testament Silver Bound, Harris's Travels, Builder's Diction^y 2 Vols.;" "A parcel of dutch and English Books;" "5 maps of 4 Quarters of World and Globe;" "1 Bible."

PARLOR CHAIR OF MAHOGANY.

The precious metals, and articles for ornament or use made of them, were as scarce as books. Silver tea-spoons were very rare, and our "Record" shows that not more than three or six were possessed by substantial farmers or mechanics, and very commonly they could boast of one only. Silver table-spoons were yet rarer; it was seldom that even the wealthy owned them or any other household article of that precious metal. Occasionally, however, we find families who counted among their valuables such heir-looms as a huge "Tankard," or a "Quart Bowl," or a "Pint Mug," or salt-cellar of silver. In one instance a "Silver Salver weighing 59½ ounces" is mentioned, and a "dozen Silver-handled knives and forks." Silver knee-buckles, shoe-buckles, and stock-buckles were largely worn by our ancestors when arrayed in their best breeches of broad-cloth, plush, nankeen, or velvet; as also silver vest and breeches buttons. Sleeve-buttons of gold and silver adorned their shirts, and often had lockets attached containing relics or miniatures. Watches and snuff-boxes of gold or silver formed an essential part of every well-bred gentleman's outfit, and the ladies wore finger and ear rings of gold, chains of gold with pendent trinkets and lockets, and in some cases necklaces, solitaires, stars, and other ornaments of garnet and gold, or gold and brilliants. But beyond the ownership of a plain gold ring these were rare and exceptional cases.

The modes of locomotion were widely different in those days from those with which

we are familiar. There were no turnpikes nor macadamized roads or railways. The travel was tedious, and the country roads were few and rugged. Journeys were mostly undertaken on horseback, and it was thus the men and women went to church, to mill, to market, and to town. Side-saddles and riding coats and habits for women were, therefore, in universal use. The vehicles, outside of the lumbering heavy wagon, were riding-chairs, chaises, and gigs, the bodies sunk down between high wheels and swung on wooden springs which were a prolongation of the shafts or thills. In the winter sleds were used as now; and besides these nearly every one had his pleasure sleigh for family use. It must have been a picturesque sight to see these when laden with ladies clad in their many-colored silks, satins, and velvets; and especially pleasant must have been the contrast of their brilliant scarlet cloaks and hoods with the snow-white mantle which covered the earth.

The men of "Seventy-six" studied brevity. This is apparent in all their manuscript writings, not so much perhaps in the expression of their ideas as in their use of words. Their abbreviations were numerous, and perplexing from their peculiarity, and some of them require almost as much patience for their interpretation as a cuneiform inscription. These were not confined to particular or much-used technical words or terminals, but were applied indiscriminately. "The" was abbreviated to "y^e," "your" to "y^r," "that" to "y^t," "companion" to "comp^a," "hundred" to "hn^d," "young" to "y^s," "Fitz" to "F^z," and so on indefinitely. When two consonants came together one was often dropped, and a circumflex was used to denote the elision. Thus "wagon," according to the established usage of those days, was correctly spelled with two g's, and when spelled with one only the writer signified that he *knew* better by placing a circumflex over it. So also with such words as "common," "trammel," "cellar," "pillow," "committee,"

BIBLE AND IRON SPECS.

etc., one of the doublets was often dropped, and its absence denoted by the circumflex. The use of capitals was also very peculiar, and yet systematic in its peculiarity. The most significant or emphatic words, such as a writer of that day describes as "the more eminent Words in a Sentence," were almost invariably capitalized, as also were all such as derived a certain gravity or solemnity from their legal, religious, moral, or other associations, and "Names of Arts, Sciences, and Trades." In this, however, they followed a usage which had long prevailed among good writers in the mother country, and which continued here some years after it had become obsolete there. As an illustration of their style, I am tempted to note some very odd collocations which occur in these old inventories, in which the most incongruous things are jumbled into strange companionship. They will provoke a smile by their quaint simplicity. For instance, among the entries are such as these: "Two fine white shirts and a pepper mill," "fifteen pounds of butter and pot and six shifts," "one pillow case with seven pounds of sugar," "one silk camlet vest and two pewter plates," "twenty four pounds of cheese and one pair of common gloves," "one large hog and one good tea-kettle," "one tankard and one pair of new sheets," "one large Bible and one new silk bonnet," "one pair of striped trowsers and one pewter teapot," "one looking-glass, one Bible, one handsaw, and twenty five fowls," "one heifer three years old and two new shirts," "one cradle and a large bake trough," "one good bedstead and sixteen bushels of turnips," "one new fine shirt and one sheep," "one tea-kettle and grindstone," "sett of Chaney and good Bible," "one English Bible and one smoothing iron," "one musket and one mare seven years old," "one yearling calf and one iron pot," "one psalm book and two bushels hard salt."

It is impossible to make a cursory examination of these inventories without being impressed by the great number of guns that were in the possession of the men of that day. The great abundance of deer, bears, foxes, wolves, and other wild animals does not entirely account for this. In New Jersey their universal distribution was largely due to the policy of the original "proprietors" to whom the colony was granted, and who made the ownership of a musket and suitable ammunition one of the conditions of their patents of land to settlers. In order that the "planting of the province may be more speedily promoted," they stipulated to grant land on the following terms: "Unto all persons who had already adventured to the province, or who shall transport themselves or servants before January 1, 1665, to every Freeman who shall go with the first

Governor.....armed with a good Musket, bore twelve bullets to the pound, with ten pounds of Powder and 20 pounds of Bullets, with Bandeliers and Match convenient..... 150 acres; and for every able servant that he shall carry with him, armed and provided as aforesaid, 150 acres." The same stipulations were extended to those who should go in two successive years thereafter; and the policy was kept up by the proprietors to a much later date. Whatever was the cause of the general supply which existed in 1776, it was most fortunate for our ancestors and their cause, since all the soldiers in the Revolutionary armies were required to furnish themselves with arms—the resolution of the Continental Congress being, "that each of the privates be allowed, instead of a bounty, one felt hat, a pair of yarn stockings, and a pair of shoes: the men to find their own arms."

The study of our ancestors of the Revolutionary period which these old inventories have invited has been a brief but tolerably close one, and the glimpses of their social condition which we have been enabled to steal have been minute. We have crossed their thresholds and inspected the interiors of their households—their parlors, kitchens, cellars, and wardrobes. We have passed in review their comforts, their few elegancies and luxuries, and have been made familiar with the simple things that made up the sum of their common necessities. Their food, raiment, and furniture have been exhibited to us, and have afforded suggestive glimpses of their manners, customs, and peculiarities. We have been witnesses of their prevalent thrift and substantial well-being at the opening of the war, and of the privations they endured and the indignity and outrage to which they were subjected when the British soldiery occupied their farms, villages, and towns, and burned or devastated their crops and dwellings. Their patient endurance, their zealous patriotism, their unconquerable devotion, their thrift, frugality, simplicity, rectitude, and fortitude, have arrested our attention and extorted our admiration. And the result has been to lift these men to a higher level. In all the qualities which contribute to genuine manhood and to enduring national character they were rich beyond any precedent; and they remain at this day the best models for our imitation in those solid and unobtrusive virtues which make a people vigorous and great. Their entire record may be scanned with reverential pride by those who are the inheritors of the liberty for which they toiled. May their memory remain green and their example influential among us as long as freedom is worth privations, sacrifices, suffering, wounds, and death!

MY MOTHER AND I.

A Love-Story for Girls.

BY THE AUTHOR OF "JOHN HALIFAX, GENTLEMAN."

CHAPTER XIII.

"SLEEPING for sorrow." Some people know what that is, especially when they are young; they know, also, how terrible is the waking.

About midnight I had thrown myself on the bed in my clothes. Just before dawn a twittering swallow outside woke me, shivering with cold, wondering where I was, and why I was still dressed. Then the whole truth poured upon me like a flood.

After a while I gathered strength and confidence enough to get up and listen. All was quiet in the next room, dead quiet. Even the faint, slow stirring of the fire, the last sound I had caught before falling asleep, had ceased. Who was there? What was happening? I opened my door noiselessly—the other door stood ajar, so that I could look in. Every thing was half dark; the fire had dropped into red embers; the nurse sat beside it, asleep in her chair. The bed I could not see, but I heard from it faint breathing, and now and then a slight moan.

Oh, my mother! my mother!

She was saying her prayers—all alone, in the middle of the night, with not a creature to love her or comfort her; sick, dying perhaps—dying without one sight of me. She was saying to herself the words which, she once told me, had been her consolation her whole life through—"Our Father," and "Thy will be done."

My heart felt like to burst. But the self-control which she had tried vainly to teach me, until God taught me in a different way, stood me in good stead now. Hiding behind the door, I succeeded in keeping myself perfectly quiet.

By-and-by she called feebly for "some water to drink," but getting no answer, turned over again with a patient sigh.

What should I do? wake the nurse, or go to my mother myself—I who had been so cruelly shut out from her? But what if, as they said, I did her harm? I had had no experience whatever of sickness or sick-nursing. Suppose at the mere sight of me she should get startled, excited? And then I remembered, almost with relief, that she could not see me. The small-pox had, as often happens, for the time being made her totally blind.

She called again upon the stupid, sleeping nurse—well, poor woman, she had not been to bed for eight nights!—and called in vain. Then I determined to risk it. Stepping stealthily forward, I came beside the bed, and looked at my darling mother. Oh, what a sight!

Once I heard a poor lady say, threatened with heart-complaint, "Thank God, it is a clean disease to die of!" and the horror of so many of those illnesses which we have to fight with and suffer from is that they are just the contrary—so terribly painful both to the sick and those about them. Small-pox is one of these.

My mother had it in a comparatively mild form; that is, the eruption had not extended beyond the face and head. Yet there she lay—she, once so sweet and pure that kissing her was, I sometimes said, like kissing a bunch of violets—one mass of unpleasantness, soreness, and pain.

Wearily she moved her head from side to side, evidently not knowing where to lay it for ease, talking to herself between whiles in a helpless, patient way, "Oh, the long, long night!—Oh, I wish it was morning!—Nurse! nurse! Isn't there any body to give me a drink of water?"

Then I hesitated no more. Ignorant as I was, and half stupid with misery besides, I managed to lift her up in the bed, and hold the glass to her lips with a perfectly steady hand, afterward re-arranging her pillows, and making her, she said, "so comfortable." This I did not once, but several times. Yet she never found me out. She said, "Thank you, nurse," and seemed a little surprised at not being answered; but that was all. Sickness was too heavy upon her to take much

notice of any thing. And then the nursing she had had was mere mechanical doing of what was necessary, not caressingly, not what a daughter's would have been. Poor darling! as she lay back again in her patient darkness, not seeming even to expect any thing—not one soothing word or touch—her poor hands folded themselves in the same meek resignation.

"Pray go to your bed, nurse. I will try to go to sleep again."

I kept silence. It was for her sake, and I did it; but it was one of the hardest things I ever had to do in all my life. Until morning I sat beside my mother, she utterly unconscious of my presence, and I thinking of nothing and nobody but her.

Yes; it was so. The sight of her poor face blotted out entirely every other face—even his. This was the real life—the dream-life was gone. As I sat there, quite quiet now, not even crying silently, as at first I had done, all I said to myself was that vow which another girl made, not to her own mother, only her mother-in-law, "God do so to me, and more also, if aught but death part thee and me."

I think I could have restrained myself, and managed so cleverly that for hours my mother might never have found me out, had not Mrs. Golding suddenly entered the room with a flash of daylight, waking up the nurse, and coming face to face with me as I sat keeping watch in her stead.

"Bless my soul! you here! Go away directly."

I said in a whisper, but with a resolution she could not mistake, "I shall not go away. I have been here half the night. No one shall nurse my mother but me."

Sick people often take things much more quietly than we expect. All things come alike to them; they are surprised at nothing. My mother only said—

"Mrs. Golding, who is it that you want to send away? Who says she has been sitting with me half the night? Was it my child?"

"Yes, mother darling, and you'll let me stay! I'll be such a good nurse—and, I'll never go to sleep at all."

She laughed, a little, low, contented laugh, and put out her hand; then suddenly seemed to recollect herself, and drew it back.

"You ought not to have come—I told you not to come."

"It is too late now, for I have been here, as I said, half the night; and didn't I make you comfortable?"

"Oh, so comfortable! Oh, how glad I am to have my child!"

This was all she said, or I. People do not talk much under such circumstances. Even Mrs. Golding forbore to blame or scold, but stood with the tea-cup in her hand until a large tear dropped into it. Then she gave it up to me, and disappeared.

The nurse followed her, a little vexed perhaps; but they both recovered themselves in time, and allowed me to take my place beside my mother without much opposition. Truly I was, as they said, "a young, ignorant, helpless thing," but they saw I tried to do my best, and it was my right to do it.

So I did it, making a few mistakes, no doubt, out of utter inexperience; but out of carelessness, never. My whole mind was set upon one thing—how I could best take care of my mother. Of those words which, when uttered, had shot through me with such a sense of joy, "Take care of yourself," I never once thought again, or of him who had said them. For the first time in my life I learned the utter absorption of a sick-room—how every thing seems to centre within its four narrow walls, and every thing in the world without seems to fade away and grow dim in the distance. No fear of my forgetting my mother now.

It was very painful sick-nursing, the most painful, I think, I ever knew, and I have known much in my lifetime. The mere physical occupation of it put out every other thought, leaving no single minute for either hopes or fears. To keep stolidly on, doing every thing that could be done, day by day, and hour by hour—that was all. As for dread of infection, or anxiety as to what would happen next, to her or to me, I do not remember even thinking of these things. Except that it was just her and me, my mother and I, as heretofore, shut up together in that one room, with the eye of God looking upon us—we uncertain what it would be His will to do, whether, in any way, either by taking her and leaving me, or healing her and smiting me—I deserved it! oh, how intensely I sometimes felt that I deserved it!—He would part mother and child.

He did it not. She slowly recovered, and by one of those mysterious chances which now and then occur with small-pox, I, though running every danger of it, never took the disease. They all watched me—I could see how they watched me, with a kind of anxious pity that I never felt for myself; but day after day went by, and still I kept perfectly well, able for all that I had to do, never once breaking down either in body or mind. My mother sometimes followed me about the room with a tender content in her eyes.

"I used to wonder what sort of woman my child would grow up—now I know."

We had "turned the tables," she and I; she was weak, I strong. Naturally, illness made her a little restless and querulous; I was always calm. In fact, as I told her, laughing, once, she was the baby, and I the old woman. Yes; that was the greatest change in me—I began to feel so very old.

COUSIN CONRAD PUT HIS HAND A MOMENT LIGHTLY ON MY SHOULDER.—[SEE PAGE 254.]

That did not matter: Heaven had preserved my mother, and me too, though I had taken my life in my hand to save or lose. It was saved. I was kept to fight on and labor on all these years, and at last, I suppose, to be laid in my coffin with the same face which, even to this day, those who love me are pleased to call beautiful.

But my mother's face was changed; though she recovered, and when she really began to mend, more rapidly than any one expected, still the disease left its mark upon her soft cheeks, her pretty neck and throat, round which, when I was quite a big girl, my sleepy hand loved to creep in babyish fashion. The expression of her dear face could not alter, but her complexion, once fresh as a child's, totally faded. When I left her—that day she stood at the door, and watched the carriage drive away—she had still looked

young; when she rose up from her sick-bed, she was almost an elderly woman.

Still, this also did not matter. People do not love their mothers as knights their lady-loves, or husbands their wives, for the sake of their youth and beauty; though I have known of chivalric devotion to a very plain woman, and tender love to a wife both feeble and old. When I got my mother once more down stairs, and had her in my arms safe and sound, warm and alive, I think no lover ever wept over his mistress more passionate, more joyful tears. Her poor faded face counted for nothing. Only to think, as I say, that she was safe and alive!—that I had fought for her with Death, and beaten him—that is, God had given me the victory. For I was so young still, so full of life: I could not accept death, as we afterward learn to do, as coming also from God's hand. The

first day that my mother came down stairs, I sang my jubilate all over the house, and ran about, half laughing, half crying like a child.

Only for one day. Then began the weary time of convalescence, sometimes better, sometimes worse—the reaction of the household from the excitement of a dangerous illness, which is always trying, and apt to leave folks rather cross. Besides, there were all the purifications to begin at once, with us still in the house. Poor Mrs. Golding! she was very good, more especially when we considered she had lost through us her summer lodgers; for it was now June. Yet for them to come in was as impracticable as for my mother and me to turn out.

"We must make it up to her in some way," said my mother, with a sigh, beginning already to trouble herself with domestic and financial anxieties, until she saw that I would not allow it. I threatened her, if she still persisted in considering me a child, incapable of managing any thing, that I would take the law into my own hands, and treat her like a captive princess; bound in silken chains, but firmly bound. At which she laughed and said I was "growing clever," besides tyrannical. But I think when Mrs. Golding assured her I really had some sense, and was managing matters almost as well as she herself could, my mother was rather proud than otherwise.

Other things she also, from the feebleness of illness, seemed to have let slip entirely. She scarcely made a single inquiry about my grandfather, or any of them in Bath. This was well, since it might have hurt her to find out—as I accidentally did—that none of them had sent to inquire, not even to the garden gate. But perhaps, on every account, this was best. And yet I could not choose but think it rather strange.

Gradually we passed out of the mysterious unnatural half life of the sick-room into the full clear daylight of common existence. Then we found out what two changed creatures we were in many respects, but still, ever and always, my mother and I.

We were sitting together in the parlor, that is, I was sitting, busy at work, and she lying idle, as was our way now. I had taken very much to my needle—the girl's dislike, the woman's consolation. The doctor had just been and said our invalid was much better—quite able to see any body, only people were afraid of infection still; and besides there was nobody to come. But he said half the village had inquired for us, and to one person in particular he had had to give, or send, a bulletin every day.

Only after the doctor had gone there darted into my mind the possibility as to who that person was. To let go of one's friends is one thing, but to be forced to feel that they have let you go, in an unkind way, and that you can not think quite so well of them

as you used to do, is another and a much harder trial. As I said my prayers that night, I added, earnestly, "Thank God!"—For what, He knew.

But neither that day nor the next did I let my mind wander one minute from my darling mother, given back to me from the very jaws of the grave. Oh, what a girl can be to a mother—a grown-up girl who is gaining the sense and usefulness of womanhood! And oh, what a mother is to a daughter, who now learns fully to feel her value, and gives her all the devotion of a lover, and all the duty of a child! More especially if no duty is exacted. My mother and I never even mentioned the word. But I loved her—God knows how I loved her—even then and through it all.

My needle-work done, I took to balancing our weekly accounts, which cost me as much trouble as if I had been Chancellor of the Exchequer, and when they were done, began to tell my mother of a good suggestion of Mrs. Golding's—that we should go to some sea-side lodging she knew of for a week or two, while she got the rooms cleaned and repapered; then we could come back and remain here the whole summer.

"She does not want to part with us; she has grown so fond of you, mother."

"But she will want more rent, and how can we pay?"

"I can pay!" said I, with pride. "I could not tell you till now, darling, but the doctor wants me to teach his children as soon as ever we are out of quarantine. He says, politely, such a good nurse will make a good governess, which does not follow. But I'll try. Do you consent?"

She sighed. She too might have had other dreams; but they had passed away like mine. She accepted the fact that I must be a governess, after all.

We kissed one another, and then, to prevent her dwelling on the subject, I began the innocent caressing nonsense which one gets into the habit of during sickness, when the patient's mind is too feeble, and the nurse's too full, to take in aught beyond the small interests close at hand. We were silly enough, no doubt, but happy—when I heard a step come up the garden, a step I knew.

My first thought—I can not well tell what it was; my second, that we were still an infected household.

"Stop him!" cried I, starting up and running to the door. "Somebody must stop him. Mrs. Golding, tell that gentleman he is not to come in."

"Why not?" And I saw him stand there, with his kind, smiling face. "Why not, Cousin Elma?"

"Because it is not safe—we are in quarantine still, you know."

"Of course I know—that and every thing else. But I have taken all precautions.

Your doctor and I are the best of friends. He sent me here. Mrs. Picardy, may I come in?"

"Certainly," she answered, looking quite pleased; so without more ado he entered. Though he took no notice, I perceived that he saw the change in her—saw it and was very sorry, both for her and me. Appropriating my chair, he sat down beside her and began talking to her, giving small attention to me, beyond a nod and smile. But that was enough; it felt like windows opened and sunshine coming into a long-shut-up room.

"General Picardy sends all sorts of kind messages to you. He left Bath almost directly after your daughter went. He said he could not bear the dullness of the house. But I have kept him almost daily informed of you both."

"Then we were not forsaken by you all," said my mother, gently, by which I guessed she had thought more of the matter than I supposed.

Cousin Conrad shook his head gayly. "Elma, tell your mother she does not quite know us yet—not so well as you do."

She looked up quickly, this dear mother of mine, first at him and then at me; but there was nothing to see. In him, of course, nothing; in me— But I had learned to accept his kindness as he meant it, the frank familiar friendship which implied nothing more. I answered Cousin Conrad as I would have answered any other friend whom I warmly liked and respected, and in whom I entirely believed.

Then I took my sewing again, and left him to his chat with my mother, which she evidently enjoyed. He had come to see her so often while I was in Bath that they were better friends than I knew. My only wonder was that all this long time she had never praised him—scarcely spoken of him to me at all.

He took tea with us, and we were very happy in his company; so happy that I almost forgot to be afraid for him. At last I thankfully heard him tell my mother that he had had small-pox very severely as a boy, and since then had gone in the way of it many times with perfect impunity.

"Not that I should ever run useless risks—one's self is not the only person to think of; and before I go home I mean to change my clothes and do a deal of fumigation. You need not have the slightest uneasiness about me, Mrs. Picardy. I may come again?"

"We shall be very happy to see you."

There was a little stiffness in my mother's manner, but she looked at him as if she liked him. I knew her face so well.

"Not that I shall burden you with many visits, as I am still going to India, though not just yet. Would you like to hear how things are settled?"

Without any apologies, but telling us as naturally as if we belonged to him, he explained that the hill-station to which he had been ordered was so healthy that the doctor said he would be as well there as in England, perhaps better. Two or three years might re-establish his strength entirely.

"And I should be thankful for that. Though when I first came home I did not much care. At five-and-twenty even, I thought my life was done."

"Mine is not, even at seven-and-forty," said my mother, smiling.

"But then you have your child."

"Ay, I have my child."

My mother looked at me—such a look! As I knelt beside her sofa, laughing, yet within an inch of crying, Cousin Conrad leaned over us and touched my hand. I felt all the blood rush into my face, and my mother saw it.

He staid but a minute or two longer; I let him out at the gate, and listened to the clatter of his horse's hoofs up the village, then came back into the parlor at once.

My mother lay quite still, looking straight before her. In her eyes was a curious expression—not exactly sad, but pensive, as if her mind had wandered far away, and a letter which Cousin Conrad had just given her, saying it was from the General, and he hoped would please her as it had pleased the sender, lay untouched on her lap.

"Shall I open it?" said I, glad to say and do something.

It was a very kind letter, signed by him with his feeble, shaky signature, though the body of it was in another handwriting, one which we both recognized. And it inclosed a hundred-pound note, begging our acceptance of the "trifle," to defray the expenses of her illness "until I can make permanent provision for my daughter-in-law and her child."

"Your child, you see, mother. He puts us both together, he does not want to take me from you now; and if he did, ever so much, I would not go. I will never leave you again—never, darling mother!"

She smiled, but not a word said she—not a single word.

I had expected she would say something of our visitor and his visit, but she did not, until just as we were going to bed, when she asked me to give her my grandfather's letter, as she would like to read it over again.

"It is very kind of him; but I suppose Major Picardy, who seems almost like a son to him, is at the root of it all."

"I suppose so."

"He too is very kind. Indeed, I never met any man who seemed to me so thoroughly good, so entirely unselfish, reliable, and true. No one could know him without loving him."

She looked at me, a keen, steady, half-smiling, half-pensive look. From that moment I was quite certain that my mother had found out all.

CHAPTER XIV.

ALL my life I have been the recipient of countless love-stories, the confidante both of young men and maidens, and I always found the benefit of that sage proverb, "Least said, soonest mended." On my side certainly, because many a silly fancy is fanned into a misplaced love by talking it over with a foolish sympathizer; on theirs, because I have generally found that those who felt the most said the least. Happiness is sometimes loquacious; but to pain—and there is so much pain always mixed up in love affairs—the safest and best panacea is silence.

My mother and I were silent to one another, perfectly silent, though we must have read one another's hearts as clear as a book, day by day; still, neither spoke. What was there to speak about? He had never said a word to me that all the world might not hear, and I—I would not think of myself or of my future. Indeed, I seemed to have no future at all after the 18th of September, the day on which the ship was to sail from Southampton.

Between now and then our life was full enough, even though outside it was as quiet and lonely as before I went to Bath, except for one friend who came to see us now and then, like any ordinary friend, to whom our interests were dear, as his to us. He came generally on a Sunday, being so occupied during the week, and he used to call us his "Sunday rest," saying that when he was abroad he would try to console himself for the loss of it by writing regularly "Dominical letters."

He was very cheerful about his departure, and very certain as to his return, which he meant to be, at the latest, within four years.

"Elma will then be one-and-twenty, and you not quite a septuagenarian, Mrs. Picardy, and the General will be only seventy-five. As I told him the other day, when he spoke of my being one day master at Broadlands, it is likely to be a good many years yet before that time arrives."

But he would be master there some time, as of course he and we both knew. Occasionally we all took a dip into the far-away future, planning what he was to do with his wealth and influence—schemes all for others, none for himself. Not a thought of luxury, or ease, or worldly position, only how he should best use all the good things that might fall to him so as to do the widest good.

How proud I was of him, and am still!

My mother, I could see, enjoyed his society

very much. She told me once there was in him a charm of manner that she had never seen in any man, except one. "Only," she added, "in nothing else does he at all resemble your father."

Though she said this with a sigh, it was not a sigh of pain. She was in no way unhappy, I think—quite the contrary—only a little meditative and grave, but that chiefly when we were alone. When Cousin Conrad came she received him warmly, and exerted herself to make all things as pleasant to him as possible; the more so because sometimes I was hardly able to speak a word.

What long still Sunday afternoons we used to spend, all three together, in our little parlor! What twilight walks we had across the Tynning and over the fields! Cousin Conrad always gave my mother his arm, and I followed after, watching the two, and noticing his exceeding tenderness over her; but I was not jealous of him—not at all.

At first I could see she was a little nervous in his company, inclined to be irritable, and quick to mark any little peculiarities he had—and he had a few; but she never criticised him, only watched him; and gradually I could perceive that she grew satisfied, and neither criticised nor watched him any more.

I had leisure to observe and think over these two, because I dared not think for a moment of myself—how it would be with me when he ceased to come, when we missed him out of our life, and the seas rolled between us, and his familiar presence was only a remembrance and a dream. Many a time when I could not sleep of nights—when all these things came upon me in such a tide that I could have wrung my hands and screamed, or got up and paced the room in the darkness, like a wild creature in its cage, only for fear of disturbing my mother—she would put out her hand and feel for me, "Child, are you wide awake still?" and take me silently into her arms.

Her tenderness over me in those last weeks—those last days—I can not describe, but have never ceased to remember. She kept me constantly employed: in fact, I was nervously eager after work, though I often left it half finished. But, whatever I did or left undone, she never blamed me. She treated me a little like a sick child, but without telling me I was ill. For I was ill—sick unto death at times with misery, with bitter, bitter humiliation—and then by fits unutterably happy; but of the happiness or the misery we neither of us spoke at all.

Only once I remember her telling me, as if by accident, the history of a friend of hers, a girl no older than myself, who, when one day coming into a room, saw a face which she had never seen before, yet from that moment she loved it—loved it in one way or other all her life.

"And he deserved her love; he was a noble and good man," said my mother.

"Did she marry him?"

"No."

We were silent a little, and then my mother continued, sewing busily as she spoke: "The world might say it was a rather sad story, but I do not. I never blamed her; I scarcely even pitied her. Love comes to us, as all other things come, by the will of God; but whether it does good or harm depends, also like other things apparently, upon our own will. There are such things as broken hearts and blighted lives, but these are generally feeble hearts and selfish lives. The really noble, of men or women, are those who have strength to love, and strength also to endure."

I said nothing, but I never forgot those healing words; and often, when most inclined to despise myself, it was balm to my heart to know that, reading it, as I was quite sure she did, my mother did not despise me; and so I made up my mind, as she had said, to "endure."

What *she* must have endured for me and through me—often, alas! from me, for I was very irritable at times—no tongue can tell. Mothers only, I think, can understand how vicarious suffering is sometimes the sharpest of all. During those days I used to pity myself; now, looking back upon them, I pity my mother. Yet I have no recollection of her ever changing from that sweet motherly calmness which was the only thing that soothed my pain.

Her pain, the anguish of seeing herself no longer able to make the entire happiness of her child, of watching the power slip out of her hands, and for a while perhaps feeling, with unutterable bitterness, a vague dread that the love is slipping away too—of this I never once thought then; I did afterward.

Well, somehow or other, the time went by and brought us to the last week, the last day, which Cousin Conrad asked if he might spend with us, both because "we were the dearest friends he had," and because he had a somewhat important message to bring from my grandfather, with whom he had been staying at Broadlands.

"And a charming place it is," he wrote, "and a very well managed estate too, though it is in Ireland." It was always a pet joke of his against my mother that she disliked every thing Irish, and distrusted him because he was just a little bit of an Irishman. She used to laugh, saying it was quite true he had all the Irish virtues, the warm, generous heart, the gay spirits, the quick sympathy, the sweet courtesy which would always rather say a kind thing than an unkind one. As for his Irish faults, she declined to pass judgment upon them. Time would show. "Ah, yes," he would some-

times answer gravely, "if Heaven grants me time."

But these passing sadnesses of his I never noticed much; the mere sight of him was enough to make any one glad; and when he came, even though it was his last time of coming, and I knew it, the joy of seeing him after a week's absence was as great as if he had been absent a year, and we had all three forgotten that he was ever to leave us again.

He and my mother fell at once to talking, discussing the proposition of which my grandfather had made him the bearer. This was that she and I should come at once to live at Broadlands, not, as I at first feared, in the characters of Miss Picardy and Miss Picardy's mother, but that she should take her position as his son's widow and the mistress of his house so long as the General lived.

"That may be many years or few," said Cousin Conrad, "and after his death he promises nothing; but," with a smile, "I think you need not be afraid."

And then he went on to explain that it was my grandfather's wish to spend half the year at Broadlands and the other half in Dublin or London, according as was convenient, especially with reference to me and the completion of my education, so as to fit me for whatever position in society I might be called upon to fill.

"Not that she is ill educated, or unaccomplished. We know what she is, do we not, Mrs. Picardy? Still her grandfather wishes her to be quite perfect, doubtless with the idea that she shall one day be—" He stopped. "I have no right to say any more, for I know nothing of the General's intentions. All I entreat is—accept his kindness. It will prove a blessing to himself and to you also. Elma rich will be a much more useful woman than Elma poor. This, whether she marries or not. If she should marry, and I hope she will one day—"

Here my mother looked up sharply. There was in her face a slight shade of annoyance, even displeasure; but it met his, so sad, so calm, so resolute, and passed away. She said nothing, only sighed.

"Forgive my referring to this subject, Mrs. Picardy; but it is one upon which the General feels very strongly; indeed, he bade me speak of it, both to relieve your mind and your daughter's. There was once a gentleman, a Sir Thomas Appleton—Elma may have told you about him."

No. Elma had not. I felt I was expected to speak; so I said, with a strange composure, and yet not strange, for it seemed as if I were past feeling any thing now, "that I had not thought it worth while to trouble my mother with my trouble about Sir Thomas Appleton."

"Trouble is an odd word for a young lady

to use when a young man falls in love with her," said Cousin Conrad, smiling; "but she really was very miserable. She looked the picture of despair for days. Never mind! as Mercutio says, 'Men have died and worms have eaten them, but not for love.' Sir Thomas is not dead yet—not likely to die. And your grandfather bade me assure you, Elma, that if half a dozen Sir Thomases should appear, he will not urge you to marry one of them unless you choose."

"That is right," said my mother, "and Elma was quite right too. If she does not love a man, she must never marry him, however her friends might wish it. She will not be unhappy even if she never marries at all. My dear child!"

"Yes, you say truly," answered Cousin Conrad, after a long pause, "and truly, also, you call her a 'child.' Therefore, as I told the General, before she marries, or is even engaged, she ought to have plenty of opportunity of seeing all kinds of men—good men—and of choosing deliberately, when she does choose, so that she may never regret it afterward. Sometimes in their twenties girls feel differently from what they do in their teens, and if after being bound they wake up and wish themselves free again—God forbid such a misfortune should happen to her."

"It never will, I think," said my mother.

"It never must," said Cousin Conrad, decisively. "We will guard against the remotest chance of such a thing. She shall be left quite free; her mother will be constantly beside her; she will have every opportunity of choice; and when she does choose, among the many who are sure to love her, she will do it with her eyes open. You understand me, do you not—you at least?" added he, very earnestly.

"I think I do."

"And you forgive me? Remember, I am going away."

"I do remember. I am not likely ever to forget," replied my mother, visibly affected, and offering him her hand. He clasped it warmly, and turned away, not saying another word.

For me, I sat apart, thinking not much of what either of them said or did, though afterward I recalled it all: thinking, indeed, very little about any thing beyond the one fact—that he was going away, that after this day I should see him no more for days and weeks and months and years.

I sat apart, taking no share in the conversation, only watching him by stealth—him to whom I was nothing at all, and he nothing to me, except just my cousin Conrad. Yet then, ay, and at any time in my life, I could have died for him! said not a word, but just quietly died! I sat, trying to lay up in my heart every trick of his manner, every line of his face, as a sort of memorial

store-house to live upon during the dark famine days that were coming.

"Well, then, that business is settled," said he, with a sigh of relief. "You will go to Broadlands as soon as you can—perhaps even next week;" and he proceeded to give minute directions for our journey, saying it would be a comfort to him to know that all was arranged as easily as possible, and he would think of us safe in my grandfather's beautiful home, while he was tossing on the Bay of Biscay. He could not hear of us for many months. There was no overland route to India then.

"But I can wait. I have learned to wait, and yet it sometimes seems a little hard, at thirty-six years old. But it is right, it is right," he added, half to himself. Years after how thankful I was to remember his words!

Then, rising, he suggested that we should sit talking no longer; but all three go out together into the pleasant afternoon sunshine and "enjoy ourselves."

"Enjoy" seemed a strange word to use, and yet it was a true one. When friends are all at peace together, with entire trust and content in one another, there is no bitterness even in the midst of parting pain. And such was his sweet nature, and the influence it had upon those about him, that this fact was especially remarkable. I have now not a single recollection of that day which is not pleasant as well as dear.

We spent part of it at a place where my mother and I had often talked of going, the abbey which we had started to see that afternoon when the bleak wind made me resolve to buy her a Paisley shawl. As we again crossed the Tynning, I overheard her telling Cousin Conrad the whole story.

"Just like her—just like Elma!" said he, turning round to look at me, and then told how, on his side, he remembered the General's calling him into his room to write a letter concerning the possible granddaughter which he thought he had found.

"It is strange upon what small chances great things seem to hang. We go on and on, year after year, and nothing happens, and we think nothing ever will happen; and then suddenly turning a corner, we come upon our destiny. Is it not so, Mrs. Picardy?"

I do not remember what my mother answered, or if she answered at all. She was exceedingly kind, even tender to him; but she was also exceedingly grave.

Thus we wandered on till we reached the old abbey—a mere ruin, and little cared for by the owners of the house in whose grounds it stood. The refectory was used as a woodshed, the chapel as a stable, and above it, ascended by a broken stair, were two large rooms, still in good preservation, said to have been the monks' library and their dovecot.

"You can still see the holes in the stone walls, I am told, where the pigeons built their nests," said my mother. "Go up and look at them, if you like, you two; I will rest here."

She sat down on a heap of hay, and we went on without her. Only once she called after us that the stair was dangerous, and he must take care of "the child."

"Ah, yes!" he said, with such a smile! It made me quite cheerful, and we began examining every thing and discussing every thing quite after the old way. Then we rested a while, and stood looking out through the narrow slits of windows on to the pleasant country beyond.

"What a comfortable life those old monks must have made for themselves! And how curious it must have been, as they sat poring over their manuscript-writing or illuminating in this very room, to hear close by the innocent little pigeons cooing in their nests! I wonder if they ever thought that the poor little birds were, in some things, happier far than they."

"How?" said I, and then instinctively guessed, and wished I had not said it.

"Very jolly old fellows, though, they must have been, with a great idea of making themselves comfortable. See, Elma, that must be the remains of their orchard—these gnarled apple-trees, so very old, yet trying to bear a few apples still; and there are their fish-ponds—undoubtedly you always find fish-ponds near monasteries; and look, what a splendid avenue of walnut-trees! No doubt they had all the good things of this life; except one, the best thing of all—home; a married home."

It was only a word—but oh, the tone in which he said it! he who, he once told me, had never had a home in all his life. Did he regret it? Was he, as I always fancied when he looked sad—was he thinking of Agnes? Only Agnes?

I was not clever, and I was very young; but I believe, even then, if any one had wanted it, I could have learned how to make a home, a real home, as only a loving woman can. Not a wealthy home, maybe, and one that might have had its fair proportion of cares and anxieties; but I would have struggled through them all. I would not have been afraid of any thing. I would have fought with and conquered, please God, all remediable evils; and those I could not conquer I would have sat down and endured without complaining. No one need have been afraid that I had not strength enough to bear my own burden, perhaps the burden of two. Nay, it would have made me happier. I never wished to have an easy life; only a life with love in it—love and trust. Oh, how happy I could have been, however difficult my lot, if only I had had some one always beside me, some one whom I could

at once look up to and take care of, cherish and adore! How we could have spent our lives together, have passed through poverty if need be, and risen joyfully to prosperity, still together! have shared our prime and our decline, always together! Instead of this—

No! Silence, my heart! What am I that I should fight against God? It was His will. With Him there are no such words as "might have been."

One thing I remember vividly—that as we stood there, looking out, Gousin Conrad put his hand a moment lightly on my shoulder.

"Keep as you are a minute. Sometimes as you stand thus, with your profile turned away, you look so very like her—so like Agnes—that I could fancy it was she herself come back again, young as ever, while I have grown quite old. Yes, compared with you, Elma, I am quite old."

I said nothing. If I had said any thing—if I could have told him that those we love to us never seem old, that, even had it been as he said, he with his gray hair was more to me, and would be down to the most helpless old age, than all the young men in the world! But how could I have said it? And if I had, it would have made no difference. Years afterward I recalled his look—firm and sweet, never wavering in a purpose which he thought right. No; nothing would have made any difference.

We staid a few minutes longer, and then came back, he helping me tenderly down the broken stairs, to my mother's side. She gave a start, and a sudden, eager, anxious look at us both; but when Cousin Conrad said, in his usual voice, that it was time for us to go home, she looked down again and—sighed.

We went home, rather silently now, and took a hasty tea, for he had to be back in Bath by a certain hour, and, besides, the mists were gathering, and my mother urged him to avoid the risk of a cold night ride.

"We must say good-by at last, and perhaps it is best after all to say it quickly," I heard her tell him, in an under-tone. Her voice trembled, the tears stood in her eyes. For me, I never stirred or wept. I was as still as a stone.

"You are right," answered he, rising. "Good-by, and God bless you. That is all one needs to say." Taking her hand, he kissed it. Then glancing at me, he asked her—my mother only—"May I?"

She bent her head in assent. Crossing the room, he came and kissed me, once on my forehead, and once—oh, thank God! just that once!—on my mouth. Where I keep it—that kiss of his—till I can give it back to him in Paradise.

For in this world I never saw my cousin Conrad more.

We had a very happy three years—my mother and I—as happy as we had ever

known. For after Cousin Conrad's departure we seemed to close up together—she and I—in one another's loving arms; understanding one another thoroughly, though still, as ever, we did not speak one word about him that all the world might not have heard.

Outwardly, our life was wholly free from care. We had as much of each other's society, or nearly as much, as we had ever had, with the cares of poverty entirely removed. My grandfather proved as good as his word, and all that Cousin Conrad had said of him he justified to the full. He received my mother with cordial welcome, and treated her from first to last with unfailing respect and consideration. She had every luxury that I could desire for her, and she needed luxuries, for after her illness she was never her strong, active self again. But she was her dear self always—the sweetest, brightest little mother in all the world.

To the world itself, however, we were two very grand people—Mrs. and Miss Picardy of Broadlands. At which we often laughed between ourselves, knowing that we were in reality exactly the same as in our shut-up poverty days—just “my mother and I.”

Cousin Conrad's letters were our great enjoyment. He never missed a single mail. Generally he wrote to her, with a little note inside for me, inquiring about my studies and amusements, and telling me of his own, though of himself personally he said very little. Whether he were well or ill, happy or miserable, we could guess only by indirect evidence. But one thing was clear enough—his intense longing to be at home.

“Not a day shall I wait,” he said in a letter to my grandfather—“not a single day after the term of absence I have prescribed to myself is ended.” And my grandfather coughed, saying, mysteriously, “that Conrad always had his crotchets; he hoped this would be the last of them; it was not so very long to look forward.”

Did I look forward? Had I any dreams of a possible future? I can not tell. My life was so full and busy—my mother seemed obstinately determined to keep it busy—that I had little time for dreams.

She took me out into society, and I think both she and my grandfather enjoyed society's receiving me well. I believe I made what is called a “sensation” in both Dublin and London. I was even presented at court, and the young Queen said a kind word or two about me, in her Majesty's own pleasant way. Well, well, all that is gone by now; but at the time I enjoyed it. It was good to be worth something—even to look at—and I liked to be liked very much, until some few did rather more than like me, and then I was sometimes very unhappy. But my grandfather kept his promise; he never urged upon me any offer of marriage. And my mother too—my tender mother—

asked me not a single question as to the why and the wherefore, though, one after another, I persistently refused them all.

“When she is one-and-twenty, my dear, we may hope she will decide. By then she will have time to know her own mind. Conrad said so, and Conrad is always right.”

Thus said my grandfather to my mother, and they both smiled at one another: they were the best of friends now, and so they remained to the last.

The last came sooner than any of us had thought—for Cousin Conrad's prophecies were not realized. When we had had only three years in which to make him happy—and I know we did make him happy—my dear grandfather died; suddenly, painlessly, without even having had time to bid us good-by. It was a great shock, and we mourned for him as if we had loved him all our lives. Ay, even though, to the great surprise of our affectionate friends—a large circle now—he left us only a small annuity—the rest of his fortune going, as the will proved he had always meant it to go, to Cousin Conrad. I was so glad!

Cousin Conrad was now obliged to come home. We had only one line from him, when he got the sad news, begging my mother to remain mistress at Broadlands until he arrived there, and adding that, if it did not trouble us very much, he should be grateful could we manage to meet him at Southampton, he being “rather an invalid.”

So we went. I need not say any thing about the journey. When it ended, my mother, just at the last minute, proposed that I should remain in the carriage, at the dock gates, while she went forward to the ship's side, where we could dimly perceive a crowd disembarking.

They disembarked. I saw them land in happy groups, with equally happy friends to greet them, laughing and crying and kissing one another. They all came home, safe and sound, all but one—my one. Deep in the Red Sea, where the busy ships sail over him, and the warm waves rock him in his sleep, they had left him—as much as could die of him—my Cousin Conrad.

* * * * *

He had died of the fatal family disease which he knew he was doomed to, though the warm climate of the East and the pure air of the hills kept it dormant for a long time. But some accidental exposure brought on inflammation of his lungs; after which he began to sink rapidly. The doctors told him he would never reach England alive; but he was determined to try. I heard it was wonderful how long the brave spirit upbore the feeble body. He did not suffer much, but just lay every day on deck; alone, quite alone, as far as near friends went—yet watched and tended by all the passengers, as if he had belonged to them for years. In

the midst of them all, these kind strange faces, he one day suddenly, when no one expected it, "fell on sleep." For he looked as if asleep—they said—with the sun shining on his face, and his hands folded, as quiet as a child.

All that was his became mine. He left it me—and it was a large fortune—in a brief will, made hastily the very day after he had received the tidings of my grandfather's death. He gave me every thing absolutely, both "because it was my right," and "because he had always loved me."

He had always loved me. Then, why grieve?

In course of years I think I have almost ceased to grieve. If, long ago, merely because I loved him, I had felt as if already married, how much more so now, when nothing could ever happen to change this feeling, or make my love for him a sin?

I do not say there was not an intermediate and terrible time, a time of utter blankness and darkness, when I "walked through the valley of the shadow of death;" alone, quite alone. But by-and-by I came out of it into the safe twilight—we came out of it,

I should say, for she had been close beside me all the while, my dearest mother!

She helped me to carry out my life, as like his as I could make it, in the way I knew he would most approve. And, so doing, it has not been by any means an unhappy life. I have had his wealth to accomplish all his schemes of benevolence; I have sought out his friends and made them mine, and been as true to them as he would have been. In short, I have tried to do all that he was obliged to leave undone, and to make myself contented in the doing of it.

"Contented," I think, was the word people most often used concerning us during the many peaceful years we spent together, my mother and I. Now it is only I. But I am, I think, a contented old woman yet. My own are still my own—perhaps the more so as I approach the time of reunion. For even here, to those who live in it and understand what it means, there is, both for us and for our dead, both in this life and in the life to come, the same "kingdom of heaven."

Of course I have always remained Elma Picardy.

THE END.

ONE OF MANY.

THE world just now is full of heroes, for the wars of the late decade are resplendent with actions well fulfilling the poet's prophecy of the period when

"Many a darkness into the light shall leap,
And shine in the sudden making of splendid names."

But among all the laureled number it has not been our fortune to hear of any whose exploits eclipse in brilliancy and *élan* those of one of our young naval officers who entered the lists a stripling, and whom the close of the war found, at the age of twenty-two, with the rank of lieutenant-commander, and with the engrossed thanks of Congress and of the Navy Department in his possession, together with countless testimonials, medals, and acknowledgments from generals of division, Union Leagues, and corporate bodies in all parts of the country: tributes to deeds which bring back to us a remembrance of those of the old heroic days—deeds so great that men became great through the mere recital of them. And certainly he who so often and so gallantly risked life and fame for his country as Lieutenant-Commander William B. Cushing did deserves some other record than the disjointed and fragmentary one hidden away in the archives of the Bureau of State; and it is a task full of interest to gather one rumor and another, sift their truth, and put official statement by statement, till the story

of those five glorious years of his service stands complete.

Midshipman Cushing sailed from Boston in the frigate *Minnesota*, and reached Hampton Roads in May, 1861—a lad then scarcely seventeen years old, but fully determined upon playing a great part in the great events to come. The *Cumberland*, the *Quaker City*, and the *Monticello*, men-of-war, all lay in the roads, and the latter of them, which has the honor of having been the first ship under fire in the rebellion, young Cushing subsequently commanded. The fleet had not been at anchor a single day when five schooners, loaded with tobacco, were captured; and that night the young midshipman took into port the *Delaware Farmer*, the first prize of the war. During the next month he was on duty with the blockading squadron on the Carolina coast; but in August he was again in Hampton Roads, and was in the first launch with those sent to storm a battery and burn some small vessels; and in the same month he sailed in the *Minnesota* to the assault of the Hatteras forts, the squadron consisting of the flagship with six other men-of-war and some steam-transports, and being the largest that had ever sailed together under the American flag. The waters to which Hatteras Inlet gave entrance at that time swarmed with privateers and blockade-runners, and its possession was an object of importance, and was guarded by the two forts, Clark and

Hatteras. As the squadron moved into line, and the first shot fired by the *Wabash* was answered by the rebel guns instantaneously, and every ship seemed suddenly sheeted in flame, the scene heightened by the contrast of perfect peace otherwise on sea and sky during all the bright summer day, we can easily imagine what an experience it was to the boy for the first time under the fire of one of those engagements to which his fancy had thrilled a thousand times, and his enjoyment of it may be known by the eagerness with which from that moment he plunged into every thing affording any promise of the same excitement and danger.

During the following winter Midshipman Cushing did blockading duty on the *Cambridge*, and saw some hot work with a party "cutting out" a schooner up a narrow stream, being attacked by and defeating a large body of infantry and artillery. He was often in this stormy season out in open boats for hours together, with the sea breaking over him, till it was sometimes necessary to hoist him on board, too stiff with ice and sleet to bend a joint. But it was at this time that the great *Merrimac* fight came off, a part of which he was—a part of the Saturday's black despondency that saw the *Cumberland* go down and the white flag flutter from the peak of the *Congress*, of the Sunday's superb confidence, when the rebel giant, with the sun glistening on her iron shields, bore down on her grounded antagonist, and never seeming to see an idle mote in the distance till a 200-pounder came from it, crashing through her consort, which turned and fled, a wreck, while shot after shot beat and brayed her own sides till the skies rang with the echoes, and the fate of the old navies, with their snowy billows of canvas, was settled by the victory of the little black iron turret.

Of course the young sailor had, as time went on, the usual number of the escapades that seem to be the peculiar properties of his class, one, not the least, of which happened after the fight at Malvern Hill, when, being ashore with his admiral, and fired, by the account of his valiant brother, with the desire of sharing in an affair that might be similar to the seven days' battle, he boldly made off in search of adventure, and rode to review the army on President Lincoln's staff, finding himself under arrest on his return, though presently, with the proverbial luck of the middy, released from duress. He was destined, however, soon to leave that fortunate and irresponsible condition, and in July, 1862, was promoted to a lieutenantancy, the intermediate grades being overlooked, and was ordered to the sounds of North Carolina; and, having turned to account the year's stern schooling, there the career that has rendered his name remarkable really began. And it may be mentioned

here that it was not only in the art of the sea-fight that he had accomplished himself, but in the more difficult art of attaching men to him in such wise that they would hazard life and fortune to follow him, a thing absolutely indispensable to his undertakings. Of this attachment of his companions and subordinates an instance may be cited to the purpose, though so trifling. This occurred once when the lieutenant went to Washington with dispatches, and when, chancing to look over the hotel register, he found the names just above his own were those of the officers who had ventured with him on that terrible night of the affair of the *Albemarle*, and whom he had supposed to be gone to their long home. He had worn on the coat which he had thrown off that night upon taking to the water a ribbon with a gold chain and locket of some value; and on springing into the room where were the officers, in the sorry guise of their prison habiliments, after the first greetings were over he saw one take from under the collar of his blouse some of the buttons of that coat, one the locket, one the chain, and another the ribbon, the men having carried these articles, unsuspected and untouched, through all the want and privations of four months in rebel prisons.

It having been decided not long subsequently to Lieutenant Cushing's promotion to make a combined movement of army and navy against the town of Franklin—afterward destroyed by the army—an agreement was entered into for the army to open the attack, and the navy to send three vessels up the Blackwater in order to intercept the retreat of the seven thousand rebels. For some reason or other the plan was changed, but the messenger dispatched by the commanding officer with the account of the change did not reach his destination in season; and presuming that all was to be as arranged, three vessels moved up the Blackwater at the appointed hour, and were presently engaged, with a couple of hundred men and a few cannon, by all the strength of the enemy, in a stream exceedingly narrow, and so crooked that lines had constantly to be taken from the ships and wound about the trees on the shore, to obtain purchase and haul the bows round the bend. At last, on working past a sharp angle of the shore, they came upon an impassable barricade, an abatis formed of the great trees felled from both banks directly across the stream, at a point where the force of the angry current drifted them strongly in toward the left side; and at the moment every object on the bank became alive, and blazed with a deadly fire, and such a yell burst forth from every quarter that it seemed to belong to the universal air. Captain Flusser instantly ordered all hands into shelter, since it would have been the merest bravado to at-

tempt fighting his few men on an open deck; but Lieutenant Cushing, chancing to glance over the side, saw a mass of infantry rushing down under cover of this fire to board the vessel that lay in such a cruel ambush, and calling for volunteers, he dashed out, cast loose the howitzer, and by the aid of half a dozen men and an officer, wheeled it to the other side of the deck. Before the piece could be leveled the seven men lay dead and dying around him, and, alone on the deck, he sent the death-dealing canister flying into the assailants with a will. It had the effect of magic, making such havoc that the enemy fled in terror—all save the leader, a man of noble appearance, who, unaware of the faltering of his troops, advanced, brandishing his sword, his long hair streaming behind him, a shining mark for death to lay low. Upon this all hands were called to the scene, the guns were worked with grape and canister, and the marines, protected by the hammocks, watched the tree-tops for a puff of smoke, and picked off the sharpshooters, who fell every moment through the breaking branches with wild cries. After that nothing was left but retreat, and there followed half a day of furious assault and repulse, of fighting for every point, in order to send the lines ashore there, and so to round the curves of the river; of struggling on the enemy's part to keep the ships in the toils, of barricades at every bend, of rifle-pits on every bluff. Of course the ship that had been in the rear of the advance now led the retreat, and received the concealed fire of a thousand infantry at every exposed spot, while the *Commodore Perry*, bringing up the rear at some distance behind, was in almost every instance unexpected by the rebels, and coming on their flank, threw into them such volleys of grape and shrapnel that those on board could distinctly see the bloody havoc that they wrought. At length, completely exhausted, the three brave vessels were in open water once more, decks wet with blood and heaped with dead and wounded, and sides fairly riddled with bullets. It was probably owing to the report of this affair, in which Lieutenant Cushing was highly complimented, that he was ordered to his first command, the gun-boat *Ellis*, a craft of a hundred tons, mounting two guns, and drawing so little water that, in Western parlance, she could float on a heavy dew; and in her the young officer, aged nineteen, resolved upon noble achievements.

After capturing the town of Swansborough, taking and being obliged to burn the *Adelaide*, with a cargo worth a hundred thousand dollars, and destroying many important salt-works, Lieutenant Cushing made a dash for the county seat of Onslow Court House, about twenty miles from the mouth of New River, where the wide and

deep waters afforded an excellent harbor for Nassau vessels. The following is his official report of the affair to his senior officer, and his demand for an investigation, which was denied him, because, as Mr. Fox said, "We don't care for the loss of a vessel when fought so gallantly as that."

"U. S. S. 'HATTEL,' November 26, 1862.

"SIR,—I have the honor to report that I entered New River Inlet on the 23d of this month, with the United States steamer *Ellis* under my command, succeeded in passing the narrow and shallow place called the Rocks, and started up the river. My object was to sweep the river, capture any vessels there, capture the town of Jacksonville, or Onslow Court House, take the Wilmington mail, and destroy any salt-works that I might find on the banks. I expected to surprise the enemy in going up, and then to fight my way out. Five miles from the mouth I came in sight of a vessel bound outward, with a load of cotton and turpentine. The enemy fired her to prevent her falling into our hands. I ran alongside, made sure that they could not extinguish the flames, and again steamed up the river. At 1 p.m. I reached the town of Jacksonville, landed, threw out my pickets, and placed guards over the public buildings. This place is the county seat of Onslow County, and quite an important town. It is situated on the right bank of the river going up, and is thirty-five or forty miles from the mouth. I captured twenty-five stand of public arms in the courthouse and post-office, quite a large mall, and two schooners. I also confiscated the negroes of the Confederate postmaster. I forgot to mention that the town is situated upon the main turnpike-road from Wilmington. Several rebel officers escaped as I neared the town, and carried the news to that city.

"At 2.30 p.m. I started down the river, and at 5 p.m. came in sight of a camp on the bank, which I thoroughly shelled. At the point where the schooner captured in the morning was still burning the enemy opened fire on the *Ellis* with rifles, but were soon silenced by our guns. I had two pilots on board, both of whom informed me that it would be impossible to take the steamer from the river that night. High water and daylight were two things absolutely essential in order to take her out. I therefore came to anchor about five miles from the outer bar, took my prizes alongside, and made every preparation to repel an attack. All night long the signal-fires of the enemy could be seen upon the banks. At daylight I got under way, and had nearly reached the worst place in the channel, when the enemy opened on us with two pieces of artillery. I placed the vessel in position, at once hoisted the battle-flag at the fore, the crew gave it three cheers, and we went into action. In one hour we had driven the enemy from his guns and from the bluff, and passed within a hundred yards of their position without receiving fire. Up to this time I had been in every way successful, but was here destined to meet with an accident that changed the fortunes of the day, and resulted in the destruction of my vessel. About five hundred yards from the bluffs, the pilots, mistaking the channel, ran the *Ellis* hard and fast aground. All hands went to work at once to lighten her, and anchors and steam were used to get her afloat, but without success. The headway of the steamer had forced her over a shoal, and into a position where, as the centre of a circle, we had a circumference of shoal all around. When the tide fell I sent a party ashore to take possession of the artillery abandoned in the morning, but when they reached the field it was discovered that it had been removed while we were at work upon the vessel. If I had secured this, I proposed to construct a shore battery to assist in the defense of my vessel by keeping the rebels from placing their battery in position. At dark I took one of my prize schooners alongside, and proceeded to take every thing out of the *Ellis* excepting the pivot-gun, some ammunition, two tons of coal, and a few small-arms. Steam and anchor again failed to get my vessel afloat. I felt confident that the Con-

federates would come on me in overwhelming force, and it now became my duty to save my men. So all hands were called to muster, and the crew told that they could go aboard the schooner. I called for six volunteers to remain with me on board and fight the remaining gun. Knowing that it was almost certain death,* the men came forward, and two master's mates, Valentine and Barton, were among the number. These gentlemen subsequently behaved with coolness and bravery. I ordered the schooner to drop down the channel out of range from the bluffs, and there to wait for the termination of the impending engagement, and if we were destroyed, to proceed to sea. Early in the morning the enemy opened upon us from four points with heavy rifled guns (one a Whitworth). It was a cross-fire, and very destructive. I replied as best I could, but in a short time the engine was disabled, and she was much cut up in every part, and the only alternatives left were surrender or a pull of one and a half miles under their fire in my small boat. The first of these was not, of course, to be thought of; the second I resolved to attempt. I fired the *Ellis* in five places, and having seen that the battle-flag was still flying, trained the gun upon the enemy, so that the vessel might fight herself after we had left, and started down the river, reached the schooner, and made sail for sea. It was low water on the bar, and a heavy surf was rolling in, but the wind forced us through after striking several times. We were just in time, for about six hundred yards down the beach were several companies of cavalry trying to reach the mouth of the inlet in time to cut us off. We hoisted our flag, gave three cheers, and were off. In four hours I reached Beaufort. I brought away all my men, my rifled howitzer and ammunition, the ship's stores and clothing, the men's bags and hammocks, and a portion of the small-arms. I retained on board the *Ellis* a few muskets, pikes, and pistols to repel boarders. I neglected to state that when I took possession of the enemy's ground on the 24th a salt-work was destroyed, and ten boats rendered useless that were to have been used for boarding.

"At 9 A.M. the United States steamer *Ellis* was blown in pieces by the explosion of the magazine. Officers and men behaved nobly, obeying orders strictly under the most trying circumstances.

"I respectfully request that a court of inquiry may be ordered to investigate the facts of the case, and to see if the honor of the flag has suffered in my hands."

This report was indorsed in commendatory terms by the senior officer to whom it was addressed, and was further indorsed by Admiral Lee with the expression of his "admiration for Lieutenant Cushing's coolness, courage, and conduct."

Shortly after this affair, there being need of pilots for the harbor of Wilmington, upon which place an attack was meditated, Lieutenant Cushing undertook to make prisoners of some; and in the course of his adventure, at night, a couple of miles up a narrow shadowy stream, he was suddenly saluted by a volley of musketry. Without losing a moment he turned his boats to shore, and crying to his men to follow him—there were but twenty in all—he had them, yelling and shouting, up a bluff and charging an earth-work, over ditch and parapet, and, through the might of sheer boldness, driving the garrison from the fort with so firm a conviction that they were surprised by a much superior body that arms and valua-

bles, and even supper, were left at the mercy of the conquerors, who, enjoying the supper, and possessing themselves of every thing portable, soon destroyed the earth-work and returned to the little prize schooner in which they had disguised their approach, and which was already rolling in the heavy swell of an advancing storm. Inside of the angle made with the coast by Cape Fear and Frying-pan Shoals, which jut out into the Atlantic for some thirty miles, and where every southwest gale heaps up the sea in a fearful manner, in a vessel of forty tons, with one anchor, a few fathoms of chain, and a lee shore alive with an angry and alert enemy—this is a situation certainly not to be coveted; and though the *Hope* ran under close-reefed canvas, it soon became apparent that, making as much leeway as headway, there was no possibility of her weathering the shoals at all. Meanwhile a tempest of rain abated in some degree the great height and power of the waves, but it was accompanied by a dense fog that in-folded the little schooner like a fleece, and shut her off from all the world of raging waters round them. At this juncture one of two things must at once be decided upon—either to go ashore and surrender vessel and crew as prisoners of war, or to put boldly out across the thirty miles of stormy space between the shore and the shoals, and, allowing for all the leeway made, endeavor to strike the mere vein of a channel that was known to streak them like a hair. Of course Lieutenant Cushing chose the latter, although, in such a gale, he was aware that the breakers must be very high even in that narrow channel. It was, in fact, a magnificent game of chance, for should they veer to the right or the left the distance of a dozen rods, not one plank of the schooner would be left upon another. Accordingly he fixed his course, placed Mr. Valentine—the same master's mate who acted so gallantly at the loss of the *Ellis*—at the helm, and told him alone of the danger.

"All at once," says Lieutenant Cushing, in relating the affair, "I saw the old quartermaster at the lead turn deathly pale as he sang out, 'Breakers ahead! For God's sake, Sir, go about!' In an instant the cry was, 'Breakers on the lee bow!' then, 'Breakers on the weather bow!' and we were into them. All seemed over now; but we stood at the helm, determined to control our boat to the last. A shock—she had struck. But it was only for a second, and she still fairly flew through the great white breakers. Again and again she struck, but never hard. She had found the channel, and in twenty minutes we were safe, and scudding for Beaufort."

Lieutenant Cushing now took command of a steamer mounting five 100-pounder smooth-bore guns, one 100-pounder Parrott rifle, and

* The magazine, as Lieutenant Cushing does not mention in his report, being entirely exposed.

a 12-pound howitzer, with a crew of one hundred and fifty men—preferring this command in Hampton Roads, with a good prospect of engagement, to that of the fast blockader *Violet* and a prospect of many rich prizes. And fighting being what he wanted, he had, one might suppose, a plenty of it, being engaged continuously for three weeks, and never once defeated: taking earth-works and bringing off the guns; pulling in his gig from ship to ship under the muzzles of the enemy's guns in full blast; taking, with ninety sailors and a howitzer, the town of Chuckatuck four hours after it had been occupied by Longstreet's left wing; making important reconnaissances, constantly exposed to danger—bullets grazing his skin, and one shearing a lock of hair from his head close to the crown—but never meeting with any injury. At the close of this duty he received a letter of congratulation and thanks from the Secretary of the Navy, and being ordered into dock for repairs, he was sent for by the President, who complimented him with enthusiasm in an hour's interview.

After being put in condition again Lieutenant Cushing's ship proceeded on an expedition up the York River, in which Brigadier-General Lee, the son of General Robert E. Lee, was made prisoner; and before long he was ordered to the defense of the capital, which the advance of the rebels had endangered. It was while he was stationed at Washington that the battle of Gettysburg took place, where his brother fell fighting in command of a battery of the Fourth United States Artillery, and Lieutenant Cushing at once proceeded to the field with the double purpose of procuring his brother's remains and of working his guns, if permitted to do so; but the army had already moved on, leaving its terrible débris of horses and cannon and caissons, of countless wounded men and unburied dead, beneath the burning sky. "As I write this," says Lieutenant Cushing, some years later—"as I write this, rocked on the long swell of the Pacific, under the warmth of an equatorial sun, my mind goes back in review of the many sad scenes in those bloody years of rebellion, but fails to bring up any picture that is so grand, or solemn, or mournful as that great theatre of death."

In the following August—that of 1863—the lieutenant went on board the *Shoboken*, which was a ferry-boat with the hull built out, fitted for work in all manner of shallow creeks, but eminently unseaworthy. In her he destroyed the blockade-runner *Hebe*, after a contest with a rebel battery; and being refused permission to do as much for another vessel in New Topsail Inlet, soon undertook the task without permission. Anchoring the *Shoboken* near the land late in the afternoon, he led the enemy to suppose that an expedi-

tion in boats was intended six miles up the river to the wharf where the prize lay; and accordingly one gun was detached from the rebel battery of six at the mouth of the inlet, carried up to the wharf, and pointed so as to command the deck of the prize, in case the remaining guns had not already annihilated the party attempting entrance; and a watch having been set, things seemed as safe as strength and vigilance could make them. But the rebels had a foe to deal with of whose strategic powers they made no calculation, and it did not enter their heads to observe that the *Shoboken* was anchored four miles up the beach, and to draw any inference from such anchorage. So, with the night, taking ashore two boats' crews in a single boat, the lieutenant had them shoulder the dingy and carry it across the narrow neck of land, and launch it on the other side, four miles inside the inlet, and entirely out of range of the battery at the mouth. A night surprise is apt to be a successful thing, for it has to aid it all the doubt and magnitude and awe of the night, which increases the attacking force to infinity, and bewilders the judgment of the assailed with darkness; but even with knowledge of this the rebels might have been amazed if they had ever learned that they were surprised, charged, and routed in the night by six sailors, their artillery and ten prisoners captured, the vessel burned, and some valuable salt-works destroyed, two sailors acting as pickets, two guarding the prisoners, and two, assisted by the ever-ready plantation hands, burning the vessel and buildings. Of course the ten prisoners would have been entirely too much for the six men if they had only known there were but six, but three of them being stowed in the dingy, while a great amount of ordering and answering passed between supposititious boats on the stream, the remainder were directed to go some furlongs up the bank and report to an officer there, and not to go too far out unless they wished to be shot by the pickets of their captors; and that being done, the lieutenant and his party glided away in the darkness and regained the *Shoboken* in safety.

But not to rest. It was only from one thing to another with this daring spirit. Finding the next day, on regaining the squadron, that it was engaged with a battery on the shore, he threw himself with twenty men into boats, assaulted the battery, and took two rifled guns, which he got aboard his ship; and immediately afterward, no other enemy being at hand, entered into a tussle with a northeast gale, which so nearly had the better of him that when he came in sight of the fleet again he learned that all had supposed him at the bottom of the sea; but he had, in truth, a curious way of always coming to the surface again,

and of frequently being taken for his own ghost, as was evident, indeed, on the night succeeding the destruction of the *Albemarle*. Immediately after this gale he was detached from the *Shoboken* and ordered to the *Monticello*, the command being given him, said Mr. Fox, "for distinguished services rendered," and it is not a little amusing to find him, hot-headed as ever, while on shore awaiting his outfit, administering summary chastisement to some men who had dared to speak disrespectfully of his uniform.

In the winter of 1862 he was again blockading off the Carolina coast. This service must have been on many accounts an interesting one—the ships by day lying at their anchorage out of the enemy's range, by night drawing together in one long line across the bar in order that none of the leaden hulls of the runners, so skillfully mingling with the tints of mist and twilight, might elude them, and always on guard against shoal and reef and the coming out of the moon to show them "close under a hundred rebel cannon," pointed at different altitudes, so that one might do what another failed to do. There were also cruisers stationed farther out, whose duty it was to determine what ought to be the whereabouts of the richly laden escaping steamers, taking into account the probable time of escape, moon and tide and speed, a look-out being always aloft to give the cry, and start the chase that would presently overhaul a million dollars for prize. Such work, however, was not adventurous enough for Lieutenant Cushing's fancy, and he determined to celebrate Washington's birthday in a more exciting manner, and by taking and holding Smith's Island, close to the enemy, one of the outlets of Cape Fear River, which would have been an event of great importance. Failing to obtain permission, through his senior officer's fear of assuming responsibility, although the undertaking proceeded on the assumption of such complete security in the strength of their position on the part of the enemy that every precaution which could stand in the way of a surprise was most probably omitted, and indignant with what seemed to him a lack of dash and spirit where it could be of any service, the young man at once proceeded to act for himself, and we have never heard of any instance since the days of windy Troy to compare with that night's adventure; for as he was not allowed the means to carry out his original proposition, Lieutenant Cushing had gravely assured his senior that in order to prove to him how completely feasible it was, he would have the honor of bringing off the Confederate commanding officer to breakfast with him in the morning. All lovers of heroism will remember the passage of the *Iliad* where Ulysses and Diomed leave the circle of old kings sitting around the field fire in the dead of the night, and exploring the hostile camps,

take the spy Dolon and destroy Rhesus in his tent, and bring off the

"steeds
More white than snow, huge and well shaped, whose
fiery pace exceeds
The winds in swiftness."

It was quite as daring a thing which Lieutenant Cushing now proposed to do.

He had already on a reconnaissance found that the rebel confidence was so great that when grazing the very face of the forts he had received no challenge, and therefore on this night he took twenty men, entered the Cape Fear River, and pulled directly up to Smithville, the rebel head-quarters, landing before the hotel, perhaps twenty-five yards from the fort, and hiding his men on the shore. Obtaining from a negro at a salt-work on the bank the requisite information, with two of his officers he crept at midnight, when not a sound disturbed the air, up the principal street to the commanding general's residence, a large house, with verandas, opposite the barracks, where, about fifteen yards off, lay twelve hundred men without a dream of danger. There had been a gay gathering, apparently, in the house that evening, and delaying till after the guests had gone and the occupants might be supposed to sleep, Lieutenant Cushing noiselessly tried the unbolted door, entered the hall, glanced into a mess-room, and then ascended the stairs. But at the moment of softly opening the door of a sleeping-room he heard a crash and the whispered call of his officer below, and quickly springing to answer it, he found that his other companion, whom he had left on the veranda, had, in a sublime confidence that the place was already taken, gone strutting up and down, awaking the Confederate adjutant-general, who, throwing up a window, found himself suddenly looking into the muzzle of a navy revolver, upon which the sash had been dropped with a clang, and the adjutant, escaping through a back-door, had made for the brush. In an instant the lieutenant was in the room, had struck a wax match, had floored the remaining occupant, the chief engineer of the forces there, and with his pistol at the head of the man, still half dazed with sleep, threatening to blow out his brains if he spoke, had made him put on some clothes, had learned from him that the commanding general had gone that day to Wilmington, had possessed himself of the adjutant-general's papers and plans, and was in his boat again and in the middle of the stream before the outraged rebels had gained their senses, or had begun to swarm out and fill the air with cries and calls; and while the signal-lights were flashing to the forts below, and the long roll calling to arms, he was pulling quietly aboard his ship, and carrying the chief engineer of the enemy, snatched from the very teeth of that enemy,

to breakfast with his commander—if not exactly what he had promised, at least the next best thing. There being occasion on the following day to send in a flag of truce, a note was dispatched by it, of which a copy is given below :

"MY DEAR GENERAL,—I deeply regret that you were not at home when I called. I inclose my card.

"Very respectfully, W. B. CUSHING."

Of course, after the first burst of indignation, the matter was taken very good-naturedly by the offended party, but this note was declared to be the very climax of impudence, and Lieutenant Cushing was given very distinctly to understand that his experiment could not be repeated—a gage which he had no opportunity to take up until the following June.

Having been undergoing repairs at Norfolk, in June Lieutenant Cushing returned to Beaufort, his coaling station, and there learned that a rebel iron-clad, the *Raleigh*, had been defying the fleet after wanton fashion, and, conscious of her strength, had not only convoyed blockade-runners through the intimidated squadron, but had remained out of harbor for several hours, only returning at her leisure after daybreak. Of course the younger officers of the navy were burning with resentment, and Lieutenant Cushing, in the *Monticello*, accompanied by the *Vicksburg*, immediately started in pursuit, though unsuccessfully, as she had taken harbor; and it was not until a letter came from Admiral Lee himself that Lieutenant Cushing was allowed the men and boats that he desired to go upon an expedition inside the bar, and to avenge the insult the navy had received by boarding and taking possession of the *Raleigh* where she lay. After dark, then, one night late in June, with fifteen men and two officers—Mr. Howorth and Mr. Martin—he slipped into the harbor, passing Forts Caswell and Holmes and the other batteries, and pulled up the river with muffled oars, just escaping being run down by a tug, and passing the town of Smithville—the scene of his capture of the chief engineer—in safety. His object was to determine the whereabouts of the *Raleigh*, and then to return and bring back a hundred men to board her. The *Raleigh*, however, was not to be seen any where either inside the bar or at quarantine, and he accordingly pursued his course up stream, although a strong current made it best for him to hazard pulling on the side where the moon lay. Just as the boat reached Fort Anderson, there came a sentry's hail, followed by the shouting of a dozen other voices and a quick volley of musketry. Immediately the lieutenant put the boat about and pointed her head down stream, and giving the helm a turn so as to present the least possible surface to the moon's rays, he cut across into the shadow

of the other bank, where he once more made his way up the river, leaving the enemy to pursue an imaginary foe in the opposite direction.

When within four miles of the city, it being nearly daylight, the crew went ashore, and drawing the boat by means of their united strength into a patch of swamp, they masked her with branches of trees, and disposed of themselves in the growth along the bank. Here during the long summer's day they saw several steamers going unobtrusively up and down the river, with the rebel commodore's flag-ship and many smaller craft, but there was no sign of the iron-clad to be seen. At twilight, however, fancying that an approaching party of fishermen in a couple of boats was a discovery and an attack, Lieutenant Cushing stepped from his hiding-place, hailed them, and boldly ordered them to surrender, which the gentle creatures did upon the spot. From these prisoners he ascertained that there was very good reason for his not finding the *Raleigh* at her anchorage, nature having taken the matter quite out of the lieutenant's hands; for having run upon a sand-bar some time previously, the iron-clad, with the falling of the tide, had broken in two by her own weight, and was now an utter wreck. Being satisfied that this was really the case, Lieutenant Cushing resolved, before returning, to obtain all the information possible concerning the batteries and obstructions of the place, knowing that a movement upon it was already in contemplation. Having mastered all the facts of the forts and channels, he at last stationed himself with eight men at a junction of the main turnpike with two other roads, hardly two miles from the city and all its swarms of soldiery and lines of fortifications. The first thing done was to capture the army mail-carrier, with his mail of between four and five hundred letters, among which were those containing plans of the rebel defenses, and other important documents; and the adventurers being by this time rather hungry, and having taken prisoner a wandering store-keeper, Mr. Howorth put on the coat and cap of the mail-carrier, mounted his horse, and started for the town to procure provisions, his pocket being well lined with the Confederate money taken from the mail; and he presently returned from his dangerous errand—one on which detection would have twisted a rope round his neck, with a very short shrift—bringing in good refreshments, and having mingled freely with the enemy, for whom he had been obliged to exert his inventive faculties after a manner that would have done justice to the best romancer living. In the mean time the lieutenant and his men had not been idle, and they were now guarding twenty-six prisoners under the most excellent discipline, since

a shout from any one of them would have brought an army about their ears; and he was now only waiting for the evening courier with the Richmond mail before rejoining the remainder of his party and putting off for sea. He decided, however, to send his prisoners to the boat, and it was just as they were crossing the road that the mail-carrier came in sight, accompanied by a Confederate officer, who, drawing a swift conclusion, turned about to flee. Being mounted on the horse of one of the prisoners, the lieutenant instantly gave chase, but to no purpose, as his horse was neither of the best nor freshest; and thereupon, cutting the telegraph wires in two places, he hastened to his boat, which now lay moored in a little creek, put the prisoners into the canoes which had been picked up, and dropped down toward the river, which was reached exactly as the shadows of night darkened it pleasantly. It had been the lieutenant's intention to leave the greater part of his prisoners on the light-house island in the river, having captured them merely for the sake of securing their silence; but just as he was putting in under the bank for that purpose the steamer *Virginia* came puffing close upon him. In a breath the order was given for every man to jump overboard and push the boats into the marsh grass, and the prisoners were promised instant death upon the first sign; and while every head was held under the gunwale for a moment, the steamer plowed by without suspicion. Having eluded this danger, Lieutenant Cushing now removed the oars and sails from the canoes, and set twenty of his prisoners adrift in the tide-way, knowing they would knock about safely there till morning, when they would be seen and cared for from shore; and attaching to a buoy, where it could not fail to be seen and taken off, a note, in which he happily recalled to the memory of the authorities their declaration that he would not again enter their harbor, he made all haste for sea, intending to pass through the upper outlet, and having Forts Anderson and Fisher to pass, together with the island and outer batteries. It was a little below Fort Anderson that, encountering a boat-load of soldiers, he captured them without ado, and learned that a guard-boat containing seventy-five men awaited him on the bar. This was not unexpected; and the fresh prisoners having been menaced with assurance of their due deserts if they attempted aid or comfort to the enemy at the critical time, it was resolved by the lieutenant and his officers to pull for the bar, the tide setting down strongly, lay themselves alongside the guard-boat in the bright moonlight, and, while engaging the men there with cutlasses and revolvers, drift with them by the batteries, which, since they could not destroy them without firing on their own men, would be likely to let

them pass. It was no great while before glimpses were caught of a boat rocking on the tide below them, and they eagerly made for it, quite confident of their ability to occupy many times their own number of land-lubbers until they should be out of range of the batteries, when it would be just as easy to leave their foe behind. But when still some yards distant from the boat, and just preparing to open a broadside upon it, suddenly four other boats darted out from behind a neighboring point, and five from the opposite island, and formed a line across the bar, completely entrapping the lieutenant and his men, while at the same time, going short round, a large sail-boat was discovered to windward. Misfortune could hardly have seemed more imminent and absolute, and if any thing could be done it must be done on the instant. The river, as it chanced, divided at that point round an island, making two channels, one that up which they had passed on the preceding night from Fort Caswell, now lying seven miles below, and which it would have been madness to try, since it would have brought them opposite Smithville and the forts by broad daylight, even if the southwest gale had not been blowing there, and making breakers in which the boat would have been crushed like a bubble. Of course, then, their only hope was to circumvent the enemy, so that the other and shorter channel might be gained, at whose entrance no such dangerous sea was to be encountered. Quickly giving the word to his men, the lieutenant darted off with his boat as if for Smithville, passing the large sail-boat; then suddenly sheering, so as to escape the full moonlight (as in going by Fort Anderson the night before), he was for one moment invisible in the swell, and the whole ten boats were after him on the way to Smithville—boats manned by soldiers instead of sailors, who were, therefore, totally unaware of the impossibility of exit by that channel. Seizing the opportunity, the lieutenant boldly turned about, and when he came in sight again was making for the sail-boat as if he intended to board her. Of course the crew of the sail-boat, unused to such contests, hesitated, and started to tack, but missed stays, and drifted away on the tide before they could recover themselves, while the crew of the lieutenant's boat, bending all their strength to the oars, darted round in a broad curve astern the line of boats, and were in the desired channel, a hundred yards in advance of all the rest, before their object was fairly understood; and heading for the breakers on Carolina Shoals, lest on another course the batteries should blow them to atoms—breakers which the boats rowed by soldiers could not dare dream of attempting—they took the great waves safely, and were presently past all pursuit. The results of this expedition

were so important, and the conduct of it so remarkable, that we are not surprised to find its leader again receiving the formal thanks of the Navy Department. Indeed, these official congratulations became apparently quite a matter of course; and in the following October he was earning them again, together not only with the engrossed thanks of the Congress of the United States, and addresses from chambers of commerce, boards of trade, municipalities, and clubs without number, but with the more substantial reward of a promotion to the grade of lieutenant-commander, at the age of twenty-one, all in recognition of his destruction of the rebel ram *Albemarle*, an iron-clad of the same model as the *Merrimac*, which had done great damage, and met the fire of hundred-pounder Dahlgrens and Parrotts at ten yards range without injury.

Directly upon his promotion the young hero took command of the flag-ship *Malvern*, bearing the broad pennant of the rear-admiral, and in December was part of the force operating against Fort Fisher. Here Commander Cushing performed what, with the exception of the *Albemarle* affair, was in reality the most dangerous exploit in all his term of service, and one requiring a more steady courage, being nothing less than the buoying of a channel in an open skiff—a skiff rivaling the famous little boat of the battle of Lake Erie—in the midst of a shower of round shot, shell, and shrapnel, the work continuing for six hours, the skiff frequently half filled with water by the plunging shot, and its companion being sunk.

During the brief cessation of more active operations against the Wilmington forts, Commander Cushing offered battle to the *Chickamauga*, a rebel privateer carrying an extra crew; but the challenge being declined, he drove a large blockade-runner ashore under her nose, and returned to the fleet, which on the 12th of January resumed the attack upon the forts, the ships being sixty in number, comprising iron-clads, frigates, sloops of war, and gun-boats. An assault being ordered after a three days' bombardment, Commander Cushing, with other officers, accompanied the force of sailors and marines about to storm the sea front of Fort Fisher. Marching to within a few hundred yards of the embrasures, the entire body threw themselves down under the slope of the beach, waiting for the signal of attack, the whole fire of the navy passing with a deafening noise just over their heads. Springing to their feet at the word of command, they moved forward steadily over the soft white sand, which the sunshine made dazzling, and the relief of which rendered every officer in his uniform of blue and gold-lace—and, indeed, every man—a conspicuous target, the rebels meanwhile pouring forth an unceasing fire that cut down their foes in windrows.

Finding himself alone at last, just after reaching the palisades, Commander Cushing turned to rally his men, and was obliged to cross a hundred yards of the bare sand with the bullets pattering about him in such wise that it seems as if he must have borne a charmed life. Most of the ranking officers were either dead or badly wounded by that time, or else remaining under shelter of the palisades till night-fall—more fortunate than their comrades, who, dropping on the beach, were swept out to sea by the rising and falling tide—he therefore assumed the command himself, and gathering some hundreds of men with great effort, he was again proceeding to the assault, when requested to relieve with them a regiment which went to the assistance of the army on the other side, which was operating to such effect under the gallant General Ames that before midnight the works had surrendered.

The first important action of Commander Cushing after the surrender was the seizure of the pilots who had so many times safely steered the blockade-runners into port; and when his preparations to hang them had thoroughly frightened them into obedience, he agreed to spare their lives on condition of their erecting the customary signal-lights on Oak Island by which the blockade-running steamers came in and out. Accordingly, some four or five days after the capture of the forts, the large blockade-running steamer *Charlotte*, trusting to the lights, came over the bar and made her private signals to Fort Caswell, and being hailed and told that the signal corps had been withdrawn to Smithville, came confidently up to her anchorage. She was commanded by a British ex-naval officer, and she carried among her other passengers two officers of the British army coming over to see the Confederate sport, and the owners of her costly cargo of arms and munitions—all of whom, in great glee at the successful termination of their hazardous enterprise, had just sat down to a sumptuous banquet, and were toasting their safe arrival in Champagne. Suddenly the door opened, a light form stepped in, a hand was laid upon the captain's chair, and every one looked up in amazement to meet the gaze of those dauntless eagle eyes of Commander Cushing, which no one who has once seen him is likely to forget. "Gentlemen," said he, "you are my prisoners. Allow me the pleasure of joining in your toast. Steward, another bottle of Champagne!" Of course there was nothing but submission, for his men were already disposed about the deck, and the *Charlotte* was his prize. There was a moment or two of sullen silence on the part of the discomfited passengers; then one of the British officers looked at his *vis-à-vis*, and exclaimed, in noble rage, "I say—beastly luck!" To which his comrade pres-

ently replied, in a voice proceeding from the depths of his disgust, "Unmitigated sell!" After which disembarassment a better feeling prevailed, and the banquet was proceeding as gayly as the circumstances allowed, when Commander Cushing was summoned on deck with the announcement that another steamer, the *Stag*, was coming up the river, upon which he bade adieu to the festive scene, and proceeded to make prize of the second steamer.

It would be easy to go on enumerating the days of this young officer by his valiant deeds; to tell of the capture of small towns, of great store-houses of cotton, corn, and bacon; of his examining the obstructions before Fort Anderson, and going so close in that one night, exasperated by the speech-making and carousal there, he sent a bullet whistling through the astonished merry-makers, and in consequence very nearly robbed the navy of one of its brightest ornaments by the storm of grape that instantly scattered the water about him; of his constructing a mock-monitor out of an old flat-boat and some painted canvas, and sending her past the fort on the night tide, so that the commandant, knowing the army to be in his rear, and seeing the gun-boats gaining the stream above, abandoned his fortifications without spiking the guns. But an account has not yet been given of the greatest of his achievements, and it is perhaps enough to close with the story of his destruction of the *Albemarle*—a more daring and spirited act than we can call to mind out of the records of any navy.

The *Albemarle*, as it has been mentioned, was an iron-clad of tremendous strength, which had already defeated the whole Federal fleet, sunk the *Southfield*, exploded the boiler of the *Sassacus*, engaged nine foes at once without danger to herself, forced the surrender of a brigade, and the abandonment of the whole region of the Roanoke by the Federal forces. The government having no iron-clads capable of crossing Hatteras bar and encountering her, all its operations in that section were rendered practically useless by the *Albemarle's* presence there, and the expense of the squadron necessary to keep watch upon her movements was something enormous. In this emergency Lieutenant Cushing submitted two plans to Admiral Lee for the ram's destruction. The admiral approved of one of them, and sent its projector to Washington to lay it before the Secretary of the Navy, and the latter, though at first a little doubtful of its merit, finally authorized him to procure the means to carry it into execution; and he immediately purchased in New York two open launches, each about thirty feet long, fitted with a small engine and propelled by a screw, carrying a howitzer, and provided with a long boom that swung by a hinge, which could be raised or

lowered at will, and which had a torpedo in the groove at its further extremity. These boats were taken down through the canals to the Chesapeake, one of them being lost on the way, and the other reaching the sounds at last through cuts and creeks and an infinitude of toils, hinderances, and ruses. Joining the fleet, which lay at the mouth of the river, the lieutenant disclosed his object to his men, assuring them that they not only must not expect, but they must not hope, to return, for death was almost inevitable, and then called for volunteers. They all stood by him, and six others presently joined them, Assistant-Paymaster Frank Swan and Mr. Howorth, who had often accompanied him on his most reckless adventures, being of the number. The *Albemarle* lay moored at the Plymouth wharf, eight miles up the river, both banks of which were lined with batteries, and held by several thousand soldiers, while, at some distance up, that portion of the wreck of the *Southfield* which still lay above water was occupied by a picket-guard, whose duty it was to throw up rockets on the first alarm, for, unknown to the attacking party, rumor of the intended endeavor had in some mysterious way already reached the Plymouth authorities, and every provision had been made for their reception. However, on the night of the 27th of October, the little launch entered the Roanoke River, her engine at low pressure, to make the least noise possible, left behind all obstructions, passed within thirty feet of the unsuspecting picket on the *Southfield*, and approached the wharf where the ram lay, a vast black mass in the darkness. Greatly emboldened by this success, the lieutenant for a moment resolved to change his plan, and, knowing the town perfectly, to put in shore and trust to the effect of a night surprise, with which he was so well acquainted, overpower those on board, get her into the stream before the forts could be aroused, and fight the batteries with her on her way down. But just as he was about to carry his sudden plan into execution, a cry from the ram rang out sharply on the night, repeated on every side, followed by the instantaneous booming of the great guns from ship and shore; and returning no answer, the lieutenant put on all steam and made for her. At the same moment an immense bonfire of pine-knots and turpentine blazed up on the bank, most fortunately for him, since it revealed directly the untoward fact that a boom of logs extended around the ram in all directions to guard her from torpedoes, which for one second seemed an insurmountable obstacle. Only for one second, though. With the next the lieutenant had given orders to sheer off across the stream, so as to get room for acquiring headway and carrying his launch by the force of its own impetus straight across the boom, though it never could get out again,

he knew. As they turned, a volley of buck-shot tore away the whole back of his coat and the sole of his shoe, and the man by his side fell lifeless. Before the volley could be repeated the launch had struck the boom, was over, and was forging up under the *Albemarle's* quarter, directly beneath the mouth of a rifle-gun, and so close that the merest whisper on board the ram, where they were endeavoring to bring the gun to bear, could be distinctly heard.

That must have been a terrifically exciting moment to those on that little launch, with the vast mountain of iron towering above them, the fire-lit mass of foes upon the shore, and triumph and eternity in the next moment. Lieutenant Cushing stood at the bows of the launch, with several lines before him: one of these lines was attached to the howitzer, one to the ankle of the engineer; one to the officer who was to lower the boom carrying the torpedo, one was that by means of which the torpedo was to be slid under the ram, another was the exploding-line, which should pull away a pin and let a grape-shot drop on the percussion-cap beneath. The howitzer had already been discharged. The line attached to the engineer was pulled: the engine stopped. The boom was lowered, the torpedo slid slowly off and under, the air-chamber at top bringing it up in position beneath the ram. The last line was pulled, the grape-shot fell, just as the rifle-gun went off—and the rebel ram and the launch blew up together, and columns of water shot up and fell again, heavy with dead and dying. But just as Lieutenant Cushing pulled the exploding line he had cried out to his men to save themselves, and throwing off arms and heavy garments, had struck out into the water. The surface was being ripped up with shot, boats were already out picking up the wounded, and dying men were going down with gurgling groans around him; but he boldly made for the other bank, and was just reaching it, when he heard the voice of one of his own men in a sinking state, and turned to relieve, if possible, one who had shared such peril with him. Finding the man, he supported him with one arm and kept him afloat for several minutes, when all at once he went down, leaving the lieutenant alone on the water, swimming with faint strokes, with what seemed interminable distances before him, but so firmly resolved to escape that, perhaps, after voluntary power was expended, the muscular motion still continued mechanically, and carried him at last to shore, where he fell, with his feet still in the water, and lay, not more than half conscious, till morning, when the bright, invigorating sunshine showed him that he had gained a piece of swamp not far from one of the forts, and from whence he could see the angry and excited town, with a curious sense of power

in the midst of all his weakness. The sentinel, meanwhile, was walking his round on the parapet, and in order to make any shelter it was necessary to rise and run for it the moment his back was turned. Doing so, he was obliged, at the instant the sentinel turned about again, to drop where he was, between two paths of the tall grass, which partially sheltered him, since, being covered with mud from head to foot, he was hardly distinguishable from the soil, as he presently found when a party of men came down one of the paths and passed so near him as almost to tread on his arm without discovering him. Knowing it would be impossible to remain there safely for any length of time, he lay on his back, planted his elbow and his heel firmly in the ground, and thus hitched himself slowly along till he gained the cypress swamp, a mass of bog and brier, through which, barefooted, bare-headed, and bare-handed, he had to force a path till the blood flowed from his innumerable wounds and bruises. Entering at last a clearing, a fresh danger appeared, in the shape of a group of soldiers, behind whom he had to pass at a distance of twenty yards, creeping through a corn furrow. He was now in the outskirts of a wood, and encountering an old negro, he gave him a piece of money which had chanced to remain about him, and sent him back to town to bring him news of what had happened there overnight; for he wished to be sure that he had done the work there thoroughly before making any more effort to get back to his ship; and famished, exhausted, and with every nerve strung to its utmost tension, it seemed to him that if he had failed he did not care to get back at all. Vibrating, in his suspense, between a fear that the man might betray him and a confidence that he would not, he rested there till the messenger came back, bringing him news of the complete destruction of the rebel ram, and he plunged gayly into another swamp, so dense that he could only direct himself by the sun, emerging from its tall reeds and brambles, a couple of hours past noon, upon one of the deep and narrow creeks that wind in and out through all those regions, exactly opposite a fresh detachment of soldiers on the other bank, and who, as fate willed it, had a little skiff made of four or five rough boards, with the seams pitched with tar, "toggled to the root of an old cypress-tree that squirmed like a snake into the inky water," as he described it. Lying in wait in the dense greenery and shade till the men went back to their rude meal, he gently slipped between the reeds and slid into the water, swimming softly till he reached the skiff, loosened it, pushed it before him round the first curve, when he clambered in and paddled away for dear life: paddled all day, into sunset, into twi-

light, into starlight—such starlight as sifted down through the great shadows of the swamp and the cypress-lined and moss-hung banks of the creek. At last he was in the Roanoke, at last in the open water of the sound, where a swell would have swamped the frail skiff, but where the night was singularly still and soft—though, as it was, he was obliged to paddle all upon one side to keep his boat on the course which he laid for himself by the stars. When he came, after a weary while, in sight of the picket vessel of the fleet, and, after what seemed a longer and still wearier while, within hail, he gave his “Ship ahoy!” and dropped, gasping, benumbed, and half dead, into the bottom of the boat. But immediately on his hail the vessel had slipped her cable, and had got out her boats to take measures against infernal machines, firmly convinced that the skiff was a piece of retaliation on the part of the rebels, and, in response to his assertion that he was Lieutenant Cushing, loudly assuring him that Lieutenant Cushing was no longer in existence; and it was still some time before he found himself on board, refreshed, clothed, and in his right mind, and on the way to the flag-ship, where, in honor of his return, rockets were thrown up and all hands called to cheer ship, even before the success of his expedition was announced. And for once valor had its due acknowledgment and reward.

JOHN AND I.

“COME, John,” said I, cheerfully, “it really is time to go; if you stay any longer I shall be afraid to come down and lock the door after you.”

My visitor rose—a proceeding that always reminded me of the genius emerging from the copper vessel, as he measured six feet three—and stood looking reproachfully down upon me.

“You are in a great hurry to get rid of me,” he replied.

Now I didn’t agree with him, for he had made his usual call of two hours and a half: having, in country phrase, taken to “sitting up” with me so literally that I was frequently at my wit’s end to suppress the yawn that I knew would bring a troop rushing after it.

He was a fine, manly-looking fellow, this John Cranford, old for his age—which was the rather boyish period of twenty-two—and every way worthy of being loved. But I didn’t love him. I was seven years his senior; and when, instead of letting the worm of concealment prey on his damask cheek, he ventured to tell his love for my mature self, I remorselessly seized an English Prayer-book, and pointed sternly to the clause, “A man may not marry his grandmother.” That was three years ago; and I added, encouragingly, “Besides, John, you

are a child, and don’t know your own mind.”

“If a man of nineteen doesn’t know his own mind,” remonstrated my lover, “I would like to know who should. But I will wait for you seven years, if you say so—fourteen, as Jacob did for Rachel.”

“You forget,” I replied, laughing at his way of mending matters, “that a woman does not, like wine, improve with age. But seriously, John, this is absurd; you are a nice boy, and I like you—but my feelings toward you are more those of a mother than a wife.”

The boy’s eyes flashed indignantly; and before I could divine his intention he had lifted me from the spot where I stood, and carried me, infant fashion, to the sofa at the other end of the room.

“I could almost find it in my heart to shake you!” he muttered, as he set me down with emphasis.

This was rather like the courtship of William of Normandy, and matters promised to be quite exciting.

“Don’t do that again,” said I, with dignity, when I had recovered my breath.

“Will you marry me?” asked John, somewhat threateningly.

“Not just at present,” I replied.

“The great, handsome fellow,” I thought, as he paced the floor restlessly, “why couldn’t he fall in love with some girl of fifteen, instead of setting his affections on an old maid like me? I don’t want the boy on my hands, and I won’t have him!”

“As to your being twenty-six,” pursued John, in answer to my thoughts, “you say it’s down in the family Bible, and I suppose it must be so; but no one would believe it; and I don’t care if you’re *forty*. You look like a girl of sixteen, and you are the only woman I shall ever love.”

Oh, John, John! at least five millions of men have said that same thing before in every known language. Nevertheless, when you fairly break down and cry, I relent—for I am disgracefully soft-hearted—and weakly promise then and there that I will either keep my own name or take yours. For love is a very dog in the manger, and John looked radiant at this concession. It was a comfort to know that if he could not gather the flower himself, no one else would.

A sort of family shipwreck had wafted John to my threshold. Our own household was sadly broken up, and I found myself comparatively young in years, with a half-invalid father, a large house, and very little money. What more natural than to take boarders? And among the first were Mr. Cranford, and his son, and sister, who had just been wrecked themselves by the death of the wife and mother in a foreign land—one of those sudden, unexpected deaths that leave the survivors in a dazed condition, be-

cause it is so difficult to imagine the gay worldling who has been called hence in another state of being.

Mr. Cranford was one of my admirations from the first. Tall, pale, with dark hair and eyes, he reminded me of Dante, only that he was handsomer; and he had such a general air of knowing every thing worth knowing (without the least pedantry, however) that I was quite afraid of him. He was evidently wrapped up in John, and patient with his sister—which was asking quite enough of Christian charity under the sun, for Mrs. Shellgrove was an unmitigated nuisance. *Such* a talker! babbling of her own and her brother's affairs with equal indiscretion, and treating the latter as though he were an incapable infant.

They staid with us three years, and during that time I was fairly persecuted about John. Mrs. Shellgrove wrote me a letter on the subject, in which she informed me that the whole family were ready to receive me with open arms—a prospect that I did not find at all alluring. They seemed to have set their hearts upon me as a person peculiarly fitted to train John in the way he should go. Every thing, I was told, depended on his getting the right kind of wife.

A special interview with Mr. Cranford, at his particular request, touched me considerably.

"I hope," said he, "that you will not refuse my boy, Miss Edna. He has set his heart so fully upon you, and you are every thing that I could desire in a daughter. I want some one to pet. I feel sadly lonely at times, and I am sure that you would just fill the vacant niche."

I drew my hand away from his caress, and almost felt like hating John Cranford. Life with him would be one of ease and luxury; but I decided that I had rather keep boarders.

Not long after this the Cranfords concluded to go to housekeeping, and Mrs. Shellgrove was in her glory. She always came to luncheon now in her bonnet, and gave us minute details of all that had been done and talked of about the house in the last twenty-four hours.

"It is really magnificent," said she, lengthening out each syllable. "Brother has such perfect taste; and he is actually furnishing the library, Miss Edna, after your suggestion. You see, we look upon you quite as one of the family."

"That is very good of you," I replied, shortly; "but I certainly have no expectation of ever belonging to it."

Mrs. Shellgrove laughed as though I had perpetrated an excellent joke.

"Young ladies always deny these things, of course; but John tells a different story."

I rattled the cups and saucers angrily;

and my thoughts floated off not to John, but to John's father, sitting lonely in the library furnished after my suggestion. Wasn't it, after all, my duty to marry the family generally?

The house was finished and moved into, and John spent his evenings with me. I used to get dreadfully tired of him. He was really too devoted to be at all interesting, and I had reached that state of feeling that, if summarily ordered to take my choice between him and the gallows, I would have prepared myself for hanging with a sort of cheerful alacrity.

I locked the door upon John on the evening in question, when I had finally gotten rid of him, with these feelings in full force; and I meditated while undressing on some desperate move that should bring matters to a crisis.

But the boy had become roused at last. He too had reflected in the watches of the night; and next day I received quite a dignified letter from him, telling me that business called him from the city for two or three weeks, and that possibly on his return I might appreciate his devotion better. I felt inexpressibly relieved. It appeared to me the most sensible move that John had made in the whole course of our acquaintance, and I began to breathe with more freedom.

Time flew, however, and the three weeks lengthened to six without John's return. He wrote to me, but his letters became somewhat constrained; and I scarcely knew what to make of him. If he would only give me up, I thought; but I felt sure that he would hold me to that weak promise of mine, that I should either become Edna Cranford or remain Edna Carrington.

"Mr. Cranford" was announced one evening, and I entered the parlor fully prepared for an overdose of John, but found myself confronted by his father.

He looked very grave; and instantly I imagined all sorts of things, and reproached myself for my coldness.

"John is well?" I gasped, finally.

"Quite well," was the reply, in such kind tones that I felt sure there was *something* wrong.

What it was I cared not, but poured forth my feelings impetuously to my astonished visitor.

"He must not come here again!" I exclaimed. "I do not wish to see him. Tell him so, Mr. Cranford! tell him that I had rather remain Edna Carrington, as he made me promise, than to become Edna Cranford."

"And he made you promise this?" was the reply. "The selfish fellow! But, Edna, what am I to do without the little girl I have been expecting? I am very lonely—so lonely that I do not see how I can give her up."

I glanced at him, and the room seemed swimming round—every thing was dreadfully unreal. I tried to sit down, and was carried tenderly to the sofa.

"Shall it be Edna Carrington or Edna Cranford?" he whispered. "You need not break your promise to John."

"Edna Cranford," I replied, feeling that I had left the world entirely, and was in another sphere of existence.

If the thought crossed my mind that Mr. Cranford had rather cheerfully supplanted his son, the proceeding was fully justified during the visit which I soon received from that young gentleman. I tried to make it plain to him that I did him no wrong, as I had never professed to love him, though not at all sure that I wouldn't receive the shaking threatened on a previous occasion, and I endeavored to be as tender as possible, for I felt really sorry for him.

To my great surprise, John laughed.

"Well, this is jolly!" he exclaimed. "And I'm not a villain, after all. What do you think of her, Edna?"

He produced an ivorytype in a rich velvet case—a pretty, little, blue-eyed simpleton; she looked like astat seventeen.

"Rose," he continued—"Rose Darling: the name suits her, doesn't it? She was staying at my uncle's in Maryland—that's where I've been visiting, you know—and she's such a dear little confiding thing that a fellow couldn't help falling in love with her. And she thinks no end of me, you see—says she's quite afraid of me, and all that."

John knew that I wasn't a bit afraid of him; but I felt an elder sisterly sort of interest in his happiness, and had never liked him so well as at that moment. And this was the dreadful news that his father had come to break to me, when his narrative was nipped in the bud by my revelations, and the interview ended in a far more satisfactory manner than either of us had anticipated.

So I kept my promise to John, after all, and as Miss Rose kept hers, he is now a steady married man, and a very agreeable son-in-law.

FALSEHOOD IN THE DAILY PRESS.

By JAMES PARTON.

IN the early days of journalism there was of necessity a very large ingredient in it of falsehood, because both writers and readers were ignorant and credulous. A London paragraphist of the year 1653 favored his readers with this item:

"A perfect Mermaid was by the last great wind driven ashore near Greenwich, with her comb in one hand and her looking-glass in the other. She seemed to be of the countenance of a most fair and beautiful woman, with her arms crossed, weeping out many pearly drops of salt tears; and afterward, she gently turning herself upon her back, swam away without being seen any more."

Probably the writer believed the substance of this paragraph, and only exercised his journalistic talent in decorating his fact with tender and romantic incidents. Men could believe any thing then, except the demonstrable truths of science. The writer of that mermaid item had seen from his childhood occasional advertisements in the gazettes announcing when and where a gracious king would next cure his subjects of scrofula by a touch of his royal finger. Here is one of them, issued by command of Charles I.:

"Whitehall, May 14, 1644.—His Sacred Majesty having declared it to be his Royal will and purpose to continue the healing of his people for the Evil during the month of May, and then to give over till Michaelmas next, I am commanded to give notice thereof, that the people may not come up to town in the interim, and lose their labor."

What were mermaids and men-fish to this? But Charles II. touched ninety-two thousand

people for the king's-evil—twenty a day for his whole reign—and even poor Louis XVI., at his coronation in 1774, was so good as to touch twenty-four hundred. So, at least, Voltaire informed King Frederick. The word "touching" gives us a most inadequate idea of the deliberate solemnity of this ceremonial in the days of the Stuarts. Imagine the king seated in a chair of state upon his throne, under a rich canopy, in a spacious hall of the palace. Each surgeon leads his patients in turn to the foot of the throne, where they kneel, and while a chaplain in full canonicals intones the words, "He put his hands upon them and healed them," the king strokes their faces with both hands at once. When all have been thus "touched," they come up to the throne again in the same order, and the king hangs about the neck of each by a blue ribbon a golden coin, while the chaplain chants, "This is the true Light who came into the world." And the whole concludes with the reading of the epistle for the day and prayers for the sick. Such was the credulity of our ancestors of yesterday! Such was the public which the press addressed in the first century of its existence!

In the early time, too, it was a thing of most imminent and deadly peril to have to do with printer's ink. In the reign of the same Charles a respectable father of a family, John Gwyn by name, was hanged, cut down while still alive, disemboweled, beheaded, and quartered, for merely *printing* a

piece disagreeable to the royalists. Editors took the hint. The great fire of London, which swept over four hundred and thirty-six acres, was chronicled in two short paragraphs, but the narrator devoted several lines of the same in assigning the glory of putting out the fire to the king, and to his brother, who was to be king. Amidst the hush of all thoughtful England a deed was done in the same reign which the timorous journalism of the time recorded thus:

"This day Algernon Sidney, Esq., was brought from the Tower to the place appointed for his execution on Tower Hill, where he was beheaded on a scaffold erected for the purpose."

No details, no comments. The monarchy, which was not strong enough to bear the simplest true narrative of heroic Sidney's murder, was strong enough to disembowel a printer and set up his head over Temple Bar. It were vain to expect much truth from newspapers when a paragraph might cost the writer his estate, the printer his entrails, and the carrier his ears.

And long after the brutal Stuarts had fled from the kingdom which they had polluted, editors were denied access to the sources of important news, while remaining always subject to the iron necessity of being interesting. Hence writers for the press resorted to inventions more or less innocent. Defoe would never have written fictitious accounts of the London fire and the great plague if the newspapers had supplied true ones; and Benjamin Franklin would not have amused the readers of the *Pennsylvania Gazette* with the "Speech of Polly Baker" if winds and tides had not retarded vessels bringing later news from over the sea. "To amuse our customers," Franklin once said, "I used to fill up our vacant columns with anecdotes and fables and fancies of my own." But, like Defoe, he gave his fables and fancies such an air of truth as to deceive. The Abbé Raynal quoted "Polly Baker" in his *History of the Indies* as an illustration of the advanced and enlightened justice of Massachusetts courts; and as to Franklin's descriptive catalogue of the packages of scalps taken by the British Indians during the Revolutionary war, it was done with such particularity and naturalness that to-day it will deceive nine readers in ten who do not know the secret. So, in our own day, the first letter in the *Cleveland Plaindealer* that was signed "Artemus Ward" was accepted as the genuine epistle of a coming moral showman.

The "local" editor in a quiet interior city often finds himself in the situation of a writer for the press in the infancy of the art. Journalism deals in the extraordinary, but nothing extraordinary has happened. Not the less—nay, all the more—is his public hungry for local news; and if he permits his readers to suffer the pangs of inanition, it is either because he is less or more than

editor. And here we have the origin of that new school of "American humor" which for ten years past has enlivened the newspapers of all lands, even to the remotest islands of the sea. Franklin began it a hundred and forty years ago, between arrivals of ships, in the *Pennsylvania Gazette*; wherein, besides such tales as "Polly Baker," he would write fictitious letters to himself (the editor), and in following numbers insert fictitious and comic replies. Artemus Ward only gave the practice a new impulse and a wider celebrity through the happiness of his conception of the moral showman, and the remarkable fertility of resource which he displayed in carrying it out. There are now afloat in the newspapers many thousands of amusing three-line fictions which had no other origin than the invention of a local itemizer, within whose sphere of observation nothing unusual had happened.

What we to-day think of as journalism began when young Samuel Johnson first composed Parliamentary speeches for *Cave's Magazine*, in 1740, which is equivalent to saying that it began in systematic falsehood. Johnson avowed the fact a few years later at Foote's table, and avowed it with a feeling that seemed nearer akin to exultation than shame. A certain speech, attributed to the elder Pitt, being highly commended, one of the guests took down the magazine and read it aloud. When the company had given full vent to their admiration, Johnson, who had sat silent during the scene, startled them all by saying, "That speech I wrote in a garret in Exeter Street." Responding to their amazement, he explained: "I never was in the gallery of the House of Commons but once in my life. Cave had interest with the door-keepers. He and the persons employed under him had admittance. They brought away the subject of discussion, the names of the speakers, the side they took, and the order in which they rose, together with notes of the various arguments adduced in the course of debate. The whole was afterward communicated to me, and I composed the speeches in the form they now have." Here, perhaps, we have the origin of Dr. Johnson's aversion to newspapers; for we all abhor our sins when another commits them. He wrote in one of his *Idlers* for 1758 that if an ambassador may be defined as a person who lies abroad for his country's good, an editor is one who lies at home for his own.

It was in Johnson's day, too, that ministers began to think writers for the press worth buying; and curious it is to note the vast difference between the emoluments of corruption and the wages of honesty. It is so in the politics of the present time. In the good old times when George III. was a young king there were still newspapers that bought items at sixpence a dozen. Journalism was a vagabond, and had been a vaga-

bond always. "All Grub Street is dead and gone," wrote Swift, when the first half-penny stamp was imposed. "No more ghosts or murders for love or money." Almost within the memory of living persons Lamb supplied amusing paragraphs at sixpence each; Campbell received two guineas for a poem in the poet's corner of a newspaper; Hazlitt wrote criticism that is still enjoyed at five shillings for a closely printed column; and Burns refused an engagement upon the *Morning Post* at a guinea a week. That Burns should decline this offer appeared to the proprietor a piece of "insolence." This proprietor was the individual who once said to a writer, "I wish I had you in a garret without a coat to your back, as I once had Coleridge." But Coleridge did not enjoy the situation, in which, however, he expended his best years, his manhood's prime, and all that we now like to think of in connection with his name.

But it was during that long reign of bigotry and ignorance that a single article of fulsome flattery of the king or reckless defense of the Prince of Wales could get a rake a rich living in the church, and when a pamphlet was often rewarded with a valuable place or liberal pension. A pleasant thing it was, and a comfortable, to be an English editor during the American Revolution, if you were discerning enough to be on the side of the king and mob. The infuriate zeal of the Tory papers betrays their imperfect sincerity. An extra of 1777, which chronicled the retreat of General Washington from the Harlem River, flamed with extravagant headings denouncing "the most wicked, daring, and unnatural rebellion that ever disgraced the annals of history, fomented and abetted by a junto of republicans on this side of the Atlantic." The exultant editor appended a little lying gossip to his news:

"Mr. Washington, notwithstanding his amour with Mrs. Gibbons, is, we hear, married to a very amiable lady, but, it is said, Mrs. Washington, being a warm loyalist, has been separated from the General since the commencement of the present troubles, and lives very much respected in the city of New York."

Thus early in the life of journalism began the exploits of those twin calumniators, "*It is said*" and "*They say*." They have worn various disguises since, only to become more mischievous. "It is perfectly notorious;" "It was stated at the time, and not denied;" "No one here doubts;" "At first we were inclined to question the story, but we have had it from so many sources that really;" "This is only the gossip of the street, but where there is so much smoke"—are only variations of the old familiar "*They say*," which in the most ancient known languages played precisely the same part it does in ours.

Journalism had no chance in the early

day, and its sins are not to be laid at its own door. It was not until within the memory of living men that Defoe's famous utterance ceased to be strictly applicable to the case of writers for the press: "If a writer tells the crimes of great men, they fall upon him with the iron hands of the law; if he tells their virtues, when they have any, then the mob attacks him with slander. But if he regards truth, let him expect martyrdom on both sides." I am not sure that these words have even yet lost all their meaning. Let any one to-day presume to defend in public any of the persons whom a considerable number of writers for the press regard in the light of established targets for vituperation, he will be likely to become a target himself. Mr. G. W. Curtis, in the columns of *Harper's Weekly*, ventured a few months ago to defend a Senator from an accusation. He was promptly warned off the premises: "If Mr. Curtis keeps this up, he will be suspected of being an accomplice."

Until the development of the telegraph had completed the resources of the daily press, the mere tumult of haste in which the vital part of its work was done was the cause of numberless errors. The exploits of the special-express riders thirty years ago were wonderful indeed; but what they gained in time the newspaper often lost in correctness. A trifling accident would delay a rider long enough to deprive the editor of the most momentary opportunity of revision. In a file of the *New York Tribune* of 1841 we read of a noted rider of that day, named Enoch Ward, who used to accomplish the distance between New Haven and New York, seventy-four miles, in four hours and a half. This was creditable enterprise, but the system kept an editorial corps in a whirl of excitement, and accustomed writers to headlong haste. The news was written as fast as the pen could be driven over the paper, and in many instances editorial comments were executed not less rapidly. I have heard the late Horace Greeley say that, in the earlier years of the *Tribune*, he thought nothing of writing a column in an hour, and that often he had kept on at this furious rate so long that he was obliged at last to wind a wet bandage round his arm to reduce the swelling and the ache to the bearable point. His excitement at the reception of news by special express is inconceivable by those who never witnessed it. Mr. Augustus Maverick has recorded the events of an evening when one of the primitive locomotives brought to New York special election returns from Patchogue, or Quogue, or some other queer place on Long Island. The cry of joy which the enthusiastic editor uttered when he saw the returns "might have been heard a quarter of a mile."

But the necessity for this tumultuous and exciting haste has ceased to exist. The an-

nihilation of distance by the telegraph, and the numerous mechanical improvements by which copies can be printed at any desired rate—a million copies an hour if it should ever be necessary—have made it possible for nearly all the work done upon newspapers to be executed with a considerable degree of deliberation. Seven-tenths of it is cool routine, and the rest may usually be done at a pace not incompatible with the exclusion of the more egregious and pernicious errors. In two countries, also, the press is now sufficiently free. In them all the old sources of intelligence are open to the press, and a new one has been added of great value, interviewing, which is founded on the principle of applying to the source of information, instead of putting trust in that ancient gossip-monger, *They say*. After two centuries and a half of struggle, more or less heroic, the daily press is free from artificial and external necessity of uttering falsehood or suppressing truth, and finds itself face to face with those difficulties of its task which are natural and unavoidable.

And yet it has not purged its columns of falsehood. There are several persons in the United States besides members of Congress who feel deeply aggrieved by its misconceptions and perversions, and there have been rumors or threats of an Anti-press Association of some kind in the city of New York. At this period of reaction it is not uncommon to hear American citizens denounce an "unbridled press" along with the other incidents of freedom, and express a wish for some measure of restraint. Nothing could be more absurd or short-sighted than such a desire. The daily press, being a human institution, is a great sinner, of course. But we might as well rail at the Hudson River because of the drainage that pours continually into it from two hundred and fifty miles of inhabited country, as to condemn the daily press on account of its perversions, exaggerations, and falsehoods. The pollution of a dozen large cities mingles with the Hudson's clear and sparkling tide, only to stain the edges of the stream, not to lessen its utility, nor much diminish its refreshing charm; for a living stream is at once a receptacle and a disinfectant. So is it with this flowing tide of publicity, the daily press, whose office is not to lead or reform the world, but chiefly to receive and carry the tidings, day by day, of what our busy race has done and thought, and, by the mere fact of publicity, preserve and distribute whatever is valuable, while letting the unclean and false sink out of sight, or drift to the ocean of oblivion.

And, as I am to descant upon the falsehoods of the daily press, it is but fair to admit that every important newspaper is conducted on the general plan of giving correct intelligence. The chief business of an editor

is to keep lies out of his journal. *His* labor is to fill the waste-paper basket, while other men fill the paper. The hasty reader glances at a page of news, consisting, perhaps, of fifty items—no great show of matter—and he thinks it an easy thing to have them all true. But those fifty may be but the residue of a thousand, and it was the examination and rejection of the nine hundred and fifty that tired out the responsible head of the department, and added another gray hair to his beard. "The average reader," as the *Springfield Republican* truly remarked the other day, "has, and can have, no conception of the flood of information that continually pours from all directions, and from all sorts of sources, into the office of a leading newspaper." The same average reader is equally unaware of the strenuous efforts made in all respectable newspaper offices to get falsehoods safely stuffed into the basket, instead of setting them afloat upon the tide of journalism, it being an axiom with all journalists who know the rudiments of their profession that falsehood, in a matter of news, hurts nothing half so much as it hurts the newspaper in which it originates.

Why, then, are there so many errors in the daily press?

It is chiefly because the task which the daily press attempts to perform is among the most difficult that man ever undertook; being no less than the gathering, writing, and publishing of the history of the world for one day in one day, a task which requires the co-operation of several hundred individuals scattered widely over the earth, many of them far beyond the reach of supervision. In the present condition of the arts and sciences this is only beginning to be a possible thing, and demands a liberality of expenditure which only a very few existing journals can sustain. If we are often offended at the calumnies and misinterpretations of the press, we oftener have reason to stand amazed at the rapid advances it makes toward actually doing what it attempts. It is but right that we should judge the unintentional errors of the press with abundant allowance for the difficulties of its work, and hail its triumphs with generous applause.

"As easy as lying," says Hamlet. This is one of those happy touches of Shakspeare that seem slight and accidental, while furnishing a fruitful text to all after-time. Self-observant persons are aware of the ease with which exaggeration and other varieties of falsehood slip from the tongue, and the extreme difficulty of giving an *exact* account of the simplest matter. And this difficulty is greatest to ardent and imaginative persons, who naturally take to writing. The very qualities of mind which give them their power to interest other minds are, in many instances, the qualities that incline them to picturesque and effective exaggeration. Tell-

ing the simple truth is the hardest thing done either by tongue or pen. How easy it was to represent Napoleon Bonaparte galloping over the Alps on a robust charger, gorgeously caparisoned, his cloak flying in the breeze, and compact legions pressing up the steep acclivity! This lie was imagined in a moment; but it cost M. Thiers much painful toil and long travel to ascertain that his conqueror crossed the Alps on a mule, muffled to the eyes in his cloak, and attended by one guide on foot.

In the press, as in literature, falsehood has the additional advantage over truth of being much the less expensive. Your raw hand will bring you in an account of a finance meeting which shall be of necessity a mere tissue of misconceptions and misstatements. To get an approximately true narrative of what occurred, without verbatim reports, you must send three persons of trained intelligence; but a full and exact report, with the requisite descriptive matter, demands the intense labor of twelve trained men. Now the account stands thus: tissue of green falsehood, two dollars; vivid narrative strongly resembling the truth, thirty dollars; verbatim report, eighty dollars. In every department of a newspaper, from the most commonplace reporting to the most important criticism, we find that lies are very cheap and truth is very dear.

We must also bear in mind that if lying is easy, it may also be for the moment highly effective. That tawdry falsehood of Bonaparte bounding over the mountains adorns at this hour hundreds of barber shops in all countries, as the tale, equally groundless, of Lincoln and the Scotch cap figures in many histories of the late war. Some men of very ordinary abilities do succeed, after long practice, in purging their conversation of the usual exaggerations and credulities; but even this negative part of a difficult virtue is apt to be purchased by the loss of vivacity. Their conversation is as dull as it is correct. But the journalist lies under an inexorable necessity of *not* being dull. Incorrect he may be, to a certain extent, and live; but if he is dull, he dies.

And, unhappily, there are three ways open to the journalist of avoiding dullness; two wrong, and one right. The right way is vigilance, tact, and hard labor in the gathering and utterance of truth proper to be told. The two wrong ways demand vastly inferior powers. One is the invention or repetition of falsehood, and the other the revelation of matters not proper to be told. A fertile and sympathetic mind, capable of public spirit, finds the material for stirring and delightful journalism in a village; but there are dull dogs that, even when posted in Washington, the most interesting capital in the world, are compelled to eke out their daily dole of routine by calumnious inven-

tion. Mr. E. J. Huling, of Saratoga, has recently described the exploits of some of those young gentlemen who are dispatched every summer to write Saratoga letters—a task demanding knowledge of the world, knowledge of human nature, a very extensive knowledge of America, and a mind capable of discriminating between what may and what may not be printed. Bewildered by the pageant, not knowing a soul in the place, having access to no circle, they soon exhaust the reputable topics, and have no resource but to dilate upon the imaginary splendors of a gambling-house. Most readers, as Mr. Huling remarks, know nothing whatever of this branch of industry, and hence a writer is safe in giving free play to his inventive powers. “I must send *something*,” says the young journalist, “that something must go to-day, and it must be interesting.” We must all allow that here is sore temptation to a young man of the best intentions, unless he has an exceptionally endowed mind. It is far from an ordinary intellect to feel the superior interest of the simple truth, and perhaps it is still farther from his inclination to take the prodigious amount of trouble which the presentation of truth compels.

Hazlitt, who lived in the iron age of journalism, used to lay the blame of newspaper falsehoods to the Editor, who was then a mysterious and awful being, despotic and capricious. He had his satellites, his court, his favorites, who flattered his whims and intrigued for his favor. A sensitive and brilliant writer like Hazlitt had no rights which this dull potentate felt himself bound to respect. He erased the contributor's happy epithets, and converted his strongest passages into prudent inanity. “There are editors,” said Hazlitt, “who, if you insert the name of a popular actor, strike it out, and in virtue of their authority insert a favorite of their own—as a dextrous attorney substitutes the name of a friend in a will.” Some editors, he adds, will let you praise nobody, others will let you blame nobody. Some dine with lords, and scrutinize every contribution with a view to its possible effect on the flow of invitations. “An editor,” he continues, “takes a turn in St. James's Street, and is congratulated by the successive literary or political groups on all he does *not* write, and when the mistake is found out, the true Simon Pure is dismissed.”

Editors are still human; but it is safe to say that no Hazlitt of the present time could be subjected to such treatment as this. A potentate has taken the place of the capricious editor in some newspaper offices, who may be styled the Incongruous Proprietor. The time was when almost every editor owned his paper. The time is at hand when scarcely any editor will do so; for a complete newspaper establishment at present absorbs an amount of capital which a high-

ly intellectualized person has never possessed unless by accident or inheritance, and which he could not efficiently wield if he had it. In conducting the prodigious establishments of modern days, there must be a division both of labor and responsibility; and when this is done justly, the public is served with an economy and efficiency never possible before. No body of learned men could produce such a work as the *American Cyclopædia* unless they had behind them both the capital and the business talent of a great publishing house; and no newspaper up to the demands of this age can exist unless there is a great man in the counting-room, as well as a great man in the editorial chair, each keeping to his sphere, but working in harmony, neither of them wholly subject or wholly lord.

It takes time, however, to get these huge things in running order, and meanwhile there is frequent dislocation. We occasionally see an odd reversal of what would seem to be the natural order: the capitalist every thing, the writer nothing; the counting-room commanding, the editorial rooms obeying. It is not yet so clearly seen as it will be that neither of these two centres of force can work successfully an engine which is at once a complicated business and an intellectual influence. By the chances of business the most ignorant person may come to own a newspaper, or one may fall by inheritance to the most incompetent individual. A lucky operator has taken a newspaper, or part of one, for a gambling debt. A corrupt Ring might acquire in a newspaper a silencing interest; and a moneyed dunderhead has occasionally bought one outright as an investment. John Taylor, the witty author of *Monsieur Tonson*, one of the best-known humorous poems in the language, who was editor for some years of the *Morning Post* of London, had an ignorant savage for proprietor. "Among other complaints," Mr. Taylor records in his *Memoirs*, "he told me that the paper was wholly confined to politics, and had none of those little *antidotes* which had before diverted the readers." It has lately been disclosed that the owner of another London paper, the *Morning Chronicle*, "made an arrangement with the government of Louis Napoleon to become the strenuous and daily supporter of the imperial régime," the French government agreeing to give in return a "concession" for a system of French telegraphic lines, in addition to large sums of money. So says Mr. James Grant, to whom this high-spirited individual twice offered the editorship. I wonder how the proprietor announced the new line of politics to his corps of writers. Not, we may presume, with the off-hand candor which sometimes marks similar events in free-and-easy America. "Boys," said the proprietor of a newspaper in Western New York to his corps, as he pre-

sented a stranger to them—"boys, this is Mr. Smith from Smithton, who has come down here to write up the new railroad. Whatever he writes, print just as he writes it, but not a word on the other side." And they obeyed. Every mail brought remonstrances against the scheme, all of which went into the basket unread.

The convict Tweed was well aware of this new fact in newspapers, the supremacy of the counting-room, though the poor man could not know that newspapers unduly controlled by the counting-room are powerless over public opinion. The number of newspapers upon the pay-roll of the Ring was eighty-nine, of which twenty-seven so depended upon this plunder for subsistence that when the Ring was broken they gasped and died. In those halcyon days of roguery people used to glance in their morning paper over a mayor's message of six or eight columns, innocently supposing it part of the news of the day, while book-keepers were at the same moment charging it to the city as an advertisement at a dollar a line. Petty evening papers received a thousand dollars a month; and after the newspapers had been bought and silenced at this rate for five years, and the Ring had no longer the control of the treasury, the unsettled "claims" of the various counting-rooms amounted to more than two millions of dollars. The writers for the press got little of this. They were put off with a ridiculous gratuity of two hundred dollars a year, voted by the aldermen to the reporters who omitted twice a week to tell the public what the aldermen had done.

There never was a period during the thirty years' reign of thieves in the city of New York when the press could not have brought them to naught, if its counting-rooms had been disinterested or its editors in command.

I wish it could be said that an interested counting-room is the only disturbing influence in the daily press, because in that case the remedy would not be difficult. The body of working journalists, in which there is a great mass of ability and force, could control the situation if they husbanded their strength and stood by one another. The men and women who produce the material of which newspapers are made are surely among the most important members of a free state. The most obscure paragraphist in the most remote and insignificant village of the Rocky Mountain States may drop into the tide of journalism an item which shall do good or do mischief wherever the English language is spoken, and remain afloat in newspapers for generations, always working beneficially or injuriously upon the minds of men. Their antipathies and preferences, their opinions and principles, mould or tinge every thing they write, and constantly enter into that atmosphere of influence, that some-

thing "in the air," to which all but the dullest and the strongest minds are subject. And it often falls to them to decide what shall appear, what shall be omitted, what shall be prominent, and what obscure. By indulging a personal preference, seizing every chance to insert a favorite name, they can create renown; and by being on the watch to erase allusion to persons they dislike, they can keep them long in the shade. There is mighty power wielded in merely leaving things out. And though a writer may have his task distinctly assigned him, he can not but infuse a portion of his personality into every sentence that he pens. If he is a man of honor and public spirit, those qualities tell in every line; if he is frivolous and dissolute, all that he does is low, small, or false.

Until within a few years past our colleges and higher schools did not contribute their fair proportion to the ranks of this difficult profession. Mr. Greeley seemed prejudiced against a youthful applicant if he came fresh from a college; and, of course, a student has much to unlearn, as well as much to learn, before he can efficiently fill the easiest place upon the staff of a daily paper. But the graduate of a college usually has qualities that come into play advantageously when, after practice, he has acquired the rudiments of his profession. He is apt to have character and a sense of responsibility, to say nothing of the knowledge which he acquired at college, and which has its value even in the lowest grade of reporting. Of late the newspaper offices have been oftener recruited than formerly by young graduates, to the manifest improvement of the service.

But there is still a residuum of the original vagabond element in some departments of journalism, which leads to egregious falsehood, often reckless, sometimes intentional. One example will suffice to show how important it is to intrust the lowest duties of journalism to persons who respect themselves and the public.

There was a poor Italian to be executed a year ago at one of the most elegant and polite of our suburban towns—Morristown, New Jersey. Never was a quiet and decorous village more astounded than Morristown was on this occasion with the conduct of the representatives of the New York press. The first to appear on the scene was the artist of the *Graphic*, who arrived two or three days before the execution, and employed himself in making drawings of the various objects to which the execution would impart a momentary interest. He took no part in the scenes about to be described. During the afternoon before the event reporters kept coming by every train, until they numbered fifteen, including the representative of the Associated Press. Early in the evening the whole body strolled from their hotel to the jail, the morning paper

men to get the material for immediate telegrams, and the evening paper men to procure the means of beginning the minute narrations which they expected to finish in the cars the next day in time for second editions. But, to their disappointment and disgust, they discovered that the worthy sheriff of the county had a deeper sympathy with a wretch about to die than with the exigencies of a band of enterprising reporters. He would not permit the prisoner to be interviewed. No admittance to the jail till to-morrow morning. The young gentlemen condemned the sheriff both on an ascending and descending plane; but as hard words do not break locks, they remained outside.

There was now a company of reporters in a country place, with an evening before them all their own. No one acquainted with newspapers needs to be informed how some of them spent that evening. One of the oldest members of the New York press divides his brethren with regard to their drinking habits into several classes. One-third he calls hard drinkers, men who are always under alcoholic influence, and often get drunk. One-third drink too much, but rarely exceed their allowance, and are seldom intoxicated. Some of this class go upon a reckless debauch occasionally, and afterward drink nothing for a considerable period. Of the remaining third a very few are teetotalers on principle, a few are teetotalers because they can not taste liquor without losing their self-control, and an extremely small number (about one-twelfth of the whole) drink a little wine or malt-liquor daily, but never to help them out with their work. In short, several of this gallant band of reporters, as soon as they found that nothing could be done in the way of business that evening, began a carouse, which lasted till past midnight, and some of them, it is supposed, kept it up till daylight.

Drinking is the blight and bane of the literary class in all countries. More than two of the brightest lights literature has known during the last twenty years as truly died from the effects of alcohol as Edgar Poe did, who was picked up insensible in the streets after a wild drink of many hours' duration. But of all the men who live by writing, it is journalists to whom alcohol is most deadly. Other men are lowered and perverted by drink, but to journalists it is ruin and death. Some men, it is true, of iron constitutions, lapse into old soakers, and descend gradually from high positions to lower, and finally wander from office to office, offering with palsied hand their manuscript to editors who were once their assistants and inferiors, and are still young enough to be their sons. But to most young men in the press who drink freely the practice is death within seven years. The shore is

strewn with the bodies of promising youths, who came to the city furnished only with the unscientific, baby morality with which so many children are sickened, and thought it a fine thing to be called Bohemians, and to end a hard night's work with a deadly supper in a cellar. They did not suspect that it was only a low and mean kind of suicide until they had lost the power to withdraw.

Alcohol, among other pernicious effects, renders the mind inexact, disposed to exaggerate, and reckless of the consequences of what it utters. Watch a man who is going down this steep decline to ruin, and you will observe, as one of the symptoms of a moral lapse along the whole line of character, a growing insensibility to the claims of truth, and a growing inability to discern truth. The Coming Journalist will not, if only for reasons of policy, have a writer in his corps who is not temperate; and in this climate, in that profession, there is only one man who is *safely* temperate: it is the teetotaler.

Such a night as those reporters passed in rural Morristown was the proper prelude to their next morning's exploits. Their behavior was, indeed, a marvel to the inhabitants; for in a country town they do not hang a man oftener than once in a generation or two, and the people in their simplicity supposed that the deliberate putting to death of a human being was an event that had in it an element of seriousness. A certain solemnity hung over the town. The children went to bed hushed and timorous. But to these carousing reporters the affair was merely a country hanging, which they regarded very much as medical students do the arrival of a new "subject" for dissection. "I made sixty-four dollars out of one little murder," I heard a perfectly respectable and worthy reporter say, with an amazing sincerity of nonchalance. Occasionally there would circulate a report that the jail was open, or that some one had come from the cell, and then the whole body would plunge headlong into the street, and go off roaring to the gate, only to return and drink anew, and curse an imbecile sheriff, an obstinate warden, and a rustic county, insensible to the importance of gentlemen representing the Metropolitan Press.

Soon after the dawn of day they began to assemble at the jail and knock for admittance. The warden came to the door, evidently impressed with the gravity of the occasion, and moved with the scene passing within. He spoke politely to the clamorous crowd. He told them that the man was awake, but engaged with the priest and the Sisters of Charity, and must not be disturbed. They demanded to be at least admitted into the jail. This, too, the warden politely refused, alleging an order of the sheriff to

admit no one until nine o'clock. More reporters kept coming up, and every few minutes some of them would give thundering knocks at the door, at which the warden would re-appear, and repeat his explanation. They argued, threatened, stormed, and swore, with a defiance of decency of which young men at 6 A.M. demoralized by alcohol alone are capable. Next they trooped off to the abode of the sheriff, a gentleman of staid respectable character, who had been for weeks dreading the duty of that day, but had nerved himself up to perform it with decorum and every humane precaution. Of him the infuriate band made a new demand. They wanted the man executed at ten o'clock instead of eleven, so that they could catch the train at half past eleven. "In New Jersey," replied the sheriff, "we do not hang people to suit the convenience of reporters."

On leaving the sheriff's house they held an informal "indignation meeting," at which it was resolved, as they expressed it, "to give the sheriff fits." The execution occurred soon after the appointed hour, and it was managed with so much forethought and skill that the man died almost immediately, and apparently without pain. Nothing marked the execution, except the extraordinary suddenness and painlessness of the prisoner's death; and this fact was noted in the report of the attending physicians, in that of the Associated Press, in that of the *Herald*, and in several of the New Jersey papers. But it was not so reported by the festive youths who had vowed to give the sheriff "fits." Here are some of the "fits" they gave him:

"An officer knocked the soap-box from under the convict.... For seven and a half minutes did the wretch suffer the horrors of asphyxia, for the knot had slipped under the chin, and the neck was not broken."

"The knot had been arranged in the most bungling manner.... Of course the wretched criminal was strangled to death. For seven minutes," etc.

"He died hard, owing to the bungling manner of conducting the execution."

"The knot had been arranged in a most bungling manner, and shifted to a position beneath the chin of the dying man. Of course the wretched criminal was strangled to death."

"Owing to a bungling arrangement of the knot, which the sheriff was advised in whispers several times to adjust, it slipped almost under his chin, and the wretched man began those repulsive struggles of agony which are shocking to behold."

"The haste and bungling made the execution seem almost like butchery."

"At the last moment the rope was found to be too short, and a box having been brought and stood on end, the culprit, an Italian, only twenty-four years of age, half crazed with excitement, leaped upon it, while the noose was attached by a series of jerks that finally caused the knot to slip around under his chin, so strangling him instead of breaking the neck."

None of these statements has any resemblance to the truth. There was no soap-box, no series of jerks, no excessive excitement, no slipping of the knot, no seven

minutes of anguish. These interesting particulars were merely the threatened "fits"—the preconcerted vengeance of reporters who could not have their hanging adjusted to the time-table of the railroad. One of the reporters, who did not show any haste to get away after the execution, explained his indifference by remarking that he had telegraphed his account half an hour before the criminal left his cell. He did not, however, omit to mention the sheriff's "bungling" and the prisoner's "seven minutes" needless agony. Such are the possibilities of falsehood and of riotous indecency to brains weakened and crazed by the fumes of alcohol! In all the press there is no disturbing influence like the whisky in the brains of journalists.

A thing which strikes an observer of the press with most surprise is the little knowledge which its conductors have of the human mind, and of the arts by which good work can be continuously got from men without impairing their working powers. The editor of a great newspaper should have little to do but acquire that knowledge and practice those arts. The successive John Walters who have conducted the London *Times* for nearly a century appear to have been the only men in the profession, until recently, who knew that the secret of great journalism lay in the gradual formation of a great corps by treating men with justice and consideration. It appears that they adopted the system seventy years ago of never paying the "market price" for a kind of work so exceptional and, I may add, so unnatural as writing, but made it a rule to pay more than others, and more than the writer would himself demand. Abundant honor also awaits the performance of excellent work, as well as the needful pause and retreat after extraordinary exertions. It is always thus that men who are born to command treat the persons whom they select to execute their plans. The consequence is that the *Times*, though not exempt from the liability to error which marks all organizations conducted by mortals, remains, after all changes, the first of European newspapers. There are other journals on both sides of the Atlantic which have the will to employ the system of the *Times*, but few have the power; and so vast is the revenue required to sustain a really superior newspaper that, perhaps, there can never be more than two or three in any country possessing an income entirely and always adequate. Are there five now existing in the world? Probably not more than five.

The suppression of half our daily papers would greatly advance the art of journalism in the United States. Five, six, seven daily papers in a city of less than a hundred thousand inhabitants! Some of these have a corps consisting of one individual; and

where there are three persons employed, the paper feels itself entitled to some rank in the world of journalism. One consequence is that two-thirds of all the working journalists in the country receive less than the wages of good mechanics; and another consequence is that the daily press, published in the midst of an intelligent people, is sometimes a daily miracle of calumnious inanity. Falsehood and folly in daily papers are, I repeat, not so much an evidence of depravity as of poverty. Intelligence and character are costly; frivolity and recklessness are cheap. The incessant abuse of individuals is one of the few resources of an empty mind. It can not discuss principles; it can not communicate knowledge; it can not enliven by wit and good humor: nothing remains to it but to assail character. And even where the decorums of the press are strictly observed, we find in the columns of newspapers which are struggling for life amazing exhibitions of helpless ignorance. The nauseating trail of fifteen dollars a week is seen all over them, a sign of that agonizing contest for existence which goes on wherever ten are trying to subsist upon means insufficient for five. And really, when I look down the long pay-roll of a complete newspaper establishment, I am inclined to wonder that such a large number of daily papers acquit themselves creditably without being able to afford one-quarter of the expenditure which excellence costs. In New York, where alone in the United States newspaper offices exist in which poor-devilism has been extirpated, the editorial force of a daily paper, fully equipped, consists of about fifty individuals, of whom at least twelve receive compensation which approaches that of the lower grades of the other liberal professions. The press has advanced so far in this one city of the Western continent that a competent and well-trained journalist receives as large a compensation as a lawyer, doctor, or clergyman of the fourth rank, and nearly enough to pay the rent of a small house in a second-rate neighborhood. This is a considerable advance from the time when Horace Greeley let Mr. Raymond leave the *Tribune* rather than add five dollars to his weekly stipend of twenty. The editor-in-chief of a New York daily paper of the first rank receives from four to eight thousand dollars a year, with the assistance of a short-hand reporter, and the use of a cab. His leading assistants receive about half as much. In London, as Mr. James Grant informs us, the established salary of the editor of a morning paper—always excepting the princely *Times*—is a thousand guineas a year. There is not likely to be for some time to come more than one newspaper in any country that can safely go much beyond this scale of compensation. And, indeed, it is almost high enough to admit of the gradual formation

of a corps capable of holding its own against the dense swarm of lies always struggling or scheming for admittance into the press. In every service under the sun the rank and file must of necessity work hard for little pay. It is only necessary to have a few great prizes to stimulate the whole body by rewarding the excellent few.

Let us by all means be just to this most difficult, most exacting, and least developed of all the liberal professions, for we all have an interest in its honor and in its prosperity. The press can not long be much better or much worse than the people to whom it ministers; and he must be blind indeed, or of most defective memory, who does not see that the daily press of this country has significantly improved in all leading particulars during the last thirty years. The mere fact that a daily newspaper is the result of fifty men's work serves to show how many apertures there are by which errors both of fact and judgment can find their way into it. And each of the members of an editorial corps is an imperfect human being, using an imperfect medium of communication, and having also his special credulities, prejudices, vanities, ambitions, timidities, sympathies, antipathies, grudges, animosities, friendships, and alliances, all more or less misleading. Some men are naturally credulous of evil, others of good. Some able and worthy journalists are cursed with a bad temper; and there may be members of the press who, as Mr. Disraeli insinuates, look with jaundiced eyes upon the victor in fields where themselves have suffered defeat. There are minds, too, which seem loosely constructed, and have little intuitive sense of probability. The latest historian of the English press, for example, garrulous James Grant, who edited, as he tells us, the *Morning Chronicle* of London for twenty years upon a salary of a thousand guineas, possesses a mind of this description. In his chapter upon the American press he pauses to explain the marvelous growth of Chicago, which he attributes to the easy divorce laws of Illinois. "Persons," he says, "whether men or women, intending to get rid of their wives or husbands flock to it from all parts of the United States." This accounts at once for the increase of population and the great number of newspapers published: for "almost every husband and wife in Chicago takes in every paper published in the town, lest the husband should unknown to her have made the declaration necessary to get rid of her, or she secretly have given it to get rid of her husband." Imagine such a Mrs. Partington sweeping out the torrent of falsehood that comes rushing into a daily newspaper! He also records that "five-sixths" of our newspapers are sold in the street, that the Americans value no news so much as they do

shipping intelligence, and that an American editor in some parts of the country has less chance of escaping assassination than an officer in the late war had to escape death in the field. There is a mind to control a newspaper!

There are also natural liars, inventors of falsehood, as there are kleptomaniacs. Here and there in the press, as out of it, there are persons like the actress Rachel, of whom her brother reports: "If she liked people, she imagined and related a thousand agreeable anecdotes about them; and if she hated them, she invented any number of enormities to illustrate their evil qualities." Others there are who believe falsehood easily, and repeat without thought any tale they chance to hear. During the period when Mr. Williams was a candidate for the place of Chief Justice, probably as many as five thousand paragraphs were printed reflecting upon his character and abilities, of which it is doubtful if five were the expression of real knowledge of the man. There is a fashion in vituperation; and while a select few of our race never join in a hue and cry *because* it is a hue and cry, a very large number are only too willing to do so. And what easier way is there to hide our ignorance, and give our readers the impression that we know the inside truth of things, than to borrow a sneering paragraph, give it a sharper sting, and send it forth to make the unskillful laugh and its unseen victim writhe?

The journalistic triumphs that have been won by the exposure of corruption will not be an unmixed blessing if they give newspapers too strong a bias toward such exploits. The great fame of Junius, too, is a misleading circumstance. Junius was not a well-informed person in politics; his sounding denunciations of public men, whose motives we now know that he misinterpreted, have given a sort of license to anonymous writers to abuse any man if only he is so unfortunate as to hold a public office. And unhappily events have occurred which incline the people to think ill of those who serve them. There are also bulls and bears in politics as well as in Wall Street—people whose party feelings dispose them to believe or to disbelieve evil of present holders of power. At this moment, as all readers know, the bear interest is powerful in the press, and it is not weak among the press's readers. It is evident that multitudes enjoy their morning villain. The very easy rôle of Cry-aloud-and-spare-not appears to be almost as popular as it is easy; for let a newspaper publish a slashing leader assailing some anxious drudge in a Washington bureau, no matter how false the charge, how cruel the calumny, a dozen subscribers will send in letters applauding the heroic exposure of "men in high places." The editor hears little of the indignation which his vague censure excites

in considerate minds, and knows nothing of the wide-spread sorrow that this daily outcry of wolf! wolf! should render the press so little able to raise an effective alarm when at last a wolf is in the fold. What government but the government of the United States has ever been strong enough or pure enough to stand the fire of indiscriminate vituperation to which it has been of late subjected?

Our daily bears have really terrified innocent readers beyond measure. They call to mind Daniel Webster's humorous remark upon the crowds of excited people that came to Washington to witness the inauguration of Andrew Jackson: "People have come five hundred miles to see General Jackson, and they really seem to think that the country is rescued from some dreadful danger!" It would be amusing now, if it were not significant of possible peril in the future, to observe the embarrassment of a worthy citizen who finds himself for the first time in Washington. He has been reading for years of the appalling state of things in that metropolis of shabby boarding-houses, one-horse cars, and impecunious clerks longing for pay-day. He has been informed by his daily bear that in that centre and focus of pollution he might see "families of secretaries and other high officers of state riding about in bretts and landaus purchased with the 'contingent fund' of the departments." Little he knows what a landau is, and the only brett with whom he had any previous acquaintance was Bret Harte. A vague horror filled his soul upon reading of these mysterious vehicles paid for out of a fund not less mysterious. "Here," continued his much-trusted daily, "is the engraving bureau of the Treasury Department turning out bushels of visiting-cards for the ladies and gentlemen of the court. Here are perquisites and allowances to the value of \$50,000 a year going to the White House, and pickings and stealings of every kind in the inferior departments of the government. The footman who waits on you when you dine with Mr. Secretary So-and-So is paid by the United States as an 'extra clerk.' The coachman who drives the secretary's wife when she shops or visits draws his pay from the department as a 'laborer' or a 'fireman,' and the gardener's name appears, perhaps, on the rolls as a 'messenger.'"

This is terrible indeed. Our innocent friend goes forth from Willard's the morning after his arrival to gaze upon the hideous scenes that foretell the downfall of his beloved country. He does not find them. If he visits the departments, he can discover nothing but a large number of busy clerks, male and female, moderately paid, who work from nine to four, and go home to boarding-houses that do not, at the first glance, seem sumptuous or inviting. There does not ap-

pear to be any card-printing going on. At the Capitol he finds three hundred gentlemen who, to the finite mind of persons not connected with the bear interest, seem to be diligently and honestly employed in serving their country. He may succeed in discovering what a brett is, and also a landau, but he must look long before he catches a "high officer of the government" in one. The only thing he can find in Washington that gives color to the statements I have quoted is that several correspondents of newspapers eke out their slender incomes by serving as secretaries to Congressional committees. Shall I ever forget the long breath of relief I once drew in the Capitol when, after three weeks' vigilant search for the iniquities of which I had read so much, I cried out, in despair, to the genial and veteran "Perley," "Where is the Lobby of which the papers tell us such dreadful things?" "The Lobby!" he replied, with a twinkle in his eye, and a smile upon the rest of his face; "the Lobby is a gigantic myth!"

Our innocent wanderer returns to his native haunts, not satisfied, indeed, with all that he saw at his country's capital, but well pleased to think that there is no evil there as great, nor as difficult to remedy, as the exaggerations of the press that sent him thither in consternation. But if he attempts to moderate the anxiety of his neighbors, he may chance to hear one of them say, as he rises from the perusal of his morning bear, "Didn't they pull the wool over the deacon's eyes in Washington?" How much easier it is to swell one poor "landaulet" into "bretts and landaus" than to reduce "bretts and landaus" down to their infinitesimal origin in the brain of an itemizer who *must* send something piquant over the wires!

To become pecuniarily strong is the first step toward the extirpation of falsehood in a newspaper. The great and durable successes, during the last century, have been won by journals which conquered, by hard knocks and gritty persistence, their independence of the chief lie-compellers—poverty, class, and party—journals which can snub subscribers, offend advertisers, defend Congress, change parties, disgust the rich, admonish the poor, or spend an extra thousand dollars a week for six months at a time, and still go on in triumph. Such papers have not always used their power aright; but they generally have; for it belongs to the very nature of the Strong to speak the truth. First, catch your hare. The acquisition of the *power* to utter truth must precede its utterance. A weak paper, like a weak man, can hardly choose but lie.

And we must admit that during the last two generations Christendom has witnessed events that have sensibly lessened the general regard for truth. There was an editor of the *Moniteur* of Paris, Napoleon Bonaparte

by name, whose bulletins were a positive advance in the art of lying, and there was scoffing Talleyrand at his side to reconcile Europe to the practice by repeating that speech was given to man to enable him to conceal his thoughts. Two such men, in such places, were enough to lower the sense of the sacredness of truth in a whole generation. And what have we of the present generation seen? We have seen this: the queen of the country that values itself above all other things for its love of truth paying a public visit to the perjured usurper of the French throne, and submitting to be kissed by him on both cheeks!

On the last celebration of Washington's birthday the press afforded us a curious illustration of the lasting harm that may result from a kind of falsehood which most people would think innocent. Scarcely any of the papers attempted to recall the character or deeds of Washington to the recollection of their readers, but a hundred paragraphists exercised their powers in jesting upon the story of the hatchet and the cherry-tree—the invention of Parson Weems, in 1800, to make his little peddler's *Life of Washington* more acceptable. That absurd fiction covers the name of Washington with a certain ridicule in perhaps a million minds.

It is we, the public, the readers of newspapers, the people of the United States, mankind in general, who need to relearn the lesson which the ages reveal to us, that truth is in itself a sacred and a precious thing. It is only the truth-revering races and men that ever long hold their own. Much of this outcry against the liars of the daily press is unjust, for there is but one liar in the daily press: it is Man.

MY WIFE'S EDITORIAL.

"IF I were an editor," said my wife, interrupting me as I was about to read her my nearly finished paper on the dynamics of our social system, "I would not waste time over such hard names and profound researches; I would work for the need of the hour, and let the need of the century take care of itself."

"Precisely what I am doing, my dear, if you would but have the courtesy to listen. You are not afraid of a few hard words?"

My spouse settled herself in that especial little easy-chair of violet velvet in which she is used to assist at the private audience, and, monished by the slight tap of her foot upon the carpet, I plunge into my subject. That foot-tap, by-the-way, is capable of as many interpretations as is the Italian *altro*. It may mean impatience, disapproval, eagerness, embarrassment, or a subtly conveyed criticism, as in the present instance, when it said simply, "Bother!"

She listened graciously, however; nodded

once or twice to some delicately poised distinction; but I noticed toward the close that her attention was wandering, and that in the pocket of her apron was a folded paper that her hand sought from time to time as the peroration drew near.

I may as well confess it at once, before proceeding further, that I am—and I like to be—tied to an apron-string! Other men may choose to deck their wives in cashmere and velvet; may gloat over the diamond in the delicate ear, or delight in the splendors of a *grande toilette*; I simply worship my wife's apron, with all the dear sanctities and sweet home charities it suggests and unfolds.

So I prepare to yield at once, when, at my last word,

"Excellent, Taddeo; a little wordy. But please listen. Here's a letter that came to me this morning. Ever since I took upon me, with fear and trembling, the secretaryship of the Woman's Aid Society, haven't I had the heart-ache! There seems such an ocean of incompetence every where, and such a very few rafts! Except for the good it does me to get very angry, I sometimes wish I was out of the whole thing—that at least I should not hear, when I can do so little to help.

"Just listen to this letter. Notice the old-fashioned handwriting, won't you?—the Italian hand of twenty years ago. Doesn't that delicate, uncertain hand tell a history? I knew before I opened it what I should find, but read it.

"DEAR MADAM,—As Secretary of the Woman's Aid Society, I lay my case before you. My father and mother are old people, and I am their only child. I was brought up in every luxury, and never expected to have to do any thing for a living.

"But my father's investments have proved unfortunate; and the failure of a banking house, where his remaining funds were deposited, has brought him to ruin. Both he and my mother are old, and since his reverses he has grown very feeble. We live in some rooms over the apothecary's shop, corner of — and — streets; but I do not know how we can retain them, as it takes all my time to wait upon my father and mother and do the necessary house-work.

"If I had any accomplishment that I could make money by I could hire a servant, but all that I am capable of is a little fancy-work, and I find that rather hard upon my eyes at present. I suppose much weeping has made them weak.

"I have tried to get copying from the lawyers, but they say my handwriting is not of the kind they use. I am no longer young, and I suppose mine is too old-fashioned.

"I see it noticed in the circular of the Woman's Aid Society that you strongly recommend domestic service to women wanting work. But even if I were competent, which I am not, to undertake any thing in this department that requires strength or skill, I could not leave my father and mother without hiring a servant for them, which would amount to the same thing as though I staid at home.

"Dear madam, I hope this letter will be confidential, as I am told the transactions of the Ladies' Repository are, where the ladies are known by numbers, and every thing is kept secret. But I will sign my full name to you,

LAVINIA VON LERNHAUSEN.

"P.S.—Do please tell me what to do. I am almost crazy thinking it all over."

"It is well," said my wife, "that she added that postscript; for when I came to the Ladies' Repository business, I was very near putting the letter in the fire.

"If ever there was a mean, false, hypocritical delicacy, it is that which encourages women to work under false colors, and to earn money while pretending in elegant idleness to make fancy-work for their friends. I never had any patience with it. Why should a woman be ashamed of earning money? Why should she hide that she is obliged to work? The endless falsehoods and evasions that it leads to!

"I remember how amazed I used to be, as a girl, at the immense amount of baby linen that was made up in one of our neighbors' houses. There were three maiden ladies, and they were forever knitting shirts and socks, and tucking and ruffling little garments, 'for one of their friends,' they would say to the inquisitive child. But I remember, when their friends drove up in elegant carriages, the work was immediately thrust behind sofa-cushions or into a closet, while they awaited their guests with folded hands and serene composure—all the while pretending to live elegantly on an income, and do nothing but for pastime. I remember what a shock it gave me afterward to find out that they were regularly employed by the Ladies' Repository, where they figured as numbers nine, twenty-seven, and eleven.

"Think of it!—a woman condescending to be a number, instead of herself; to take as a sort of mitigated charity the reward of her own hard work! It is one of the weaknesses that I like to make war upon. Which is more degrading, I should like to know, working or lying?

"And here was one of our own managers the other day coming to ask for copying for some young ladies who needed work, saying she had promised them that their names should not be known. She wanted to take it out in her own name, but fortunately we have a good honest rule that compels the registry of all actual copyists. And the father of those girls is a worn-out book-keeper, who holds his place from the sheer inability to give it up. Every body knows how hard he works. Any body may see him going down street early and returning late. It is only that his daughters are ashamed of work for themselves—they are not ashamed of it for him.

"If ever you break down, my dear Taddeo, with over brain-work"—here a slight smile curled the lip of my queen—"and I have to do crayon heads or mend lace for a living, depend upon it I will have a sign that shall reach all across the house.

"But this poor girl! 'No longer young?' Oh, my dear, what a wicked, wicked father she must have had, not to make her life secure?"

And again my wife taps her foot. The remark, I observe, is not characterized by her usual sagacity, and I tell her so.

"How can any thing be secure in this day and generation? What rock more firm, to all appearance, than that on which Ogontz was builded, of fair fortune and fair fame; and look! an autumn wind has scattered its tenants with the autumn leaves. It is nonsense to talk of permanent fortunes in America."

"It is and it isn't. The fortune I meant was the knowledge of work, the trade, the art training, the profession or business, that fathers give to all their sons, but withhold from their daughters, with a blindness equal to Milton's own. I have never been able to forgive that old tyrant for teaching his daughters the Greek letter for his own benefit, and refusing them the golden grain to which it was the key. And"—with a skillful diversion to an apparently irrelevant topic—"if resistance to tyrants be obedience to God, I don't wonder that his wives ran away from him. You needn't raise your eyebrows, Taddeo; I say wives in a Tilly Slow-boy sense. I know perfectly well there was only one who did. It's a pity that others of the family hadn't the courage of the example."

"If my wife were to run away from me just now, I *might* finish my paper," I humbly suggest; "but what with Mrs. John Milton, the Misses Milton, and Miss Lavinia— Pardon me, I forgot her desire to remain unknown—"

"Let me write an editorial;" and my wife seized upon a pen. The result of her raid upon my writing-table is herewith respectfully submitted. TADDEO GADDI.

CHOOSING A CAREER.

One sharp lesson of the autumn's panic, and, indeed, of our shifting American fortunes without any panic at all, is the wasteful folly and cruelty of the old education of woman. It is folly, in an economic sense, that ignores the sharp possibilities of the future for our girls, while we send our boys out into life fully armed and equipped for the fray.

The young man, returned from college or the scientific school, in the bright glow of dawning powers, untrammelled as yet by care, and under the shelter of his father's roof, decides upon his career. Admiring aunts and sisters waft their prayers and hopes upon the winds that wing his sail; the father's experience and counsel pilot the boat through the shallow waters near the shore. Every thing aids his start—youth, freshness, and special training. He has no responsibility upon him save for his own health and good behavior.

When does a woman choose her career? In middle age; broken down by sorrow; when she has seen her life's hopes go down one by one in the horizon. As a girl, she has waited in her father's house for the lover who never came. All of youth has gone by in vague dreams. In

the frivolous business of fashionable society her strength has spent itself.

Her hands are skill-less save in delicate embroidery; her brain is sluggish, though it aches with this new anxiety and despair. Heavily weighted with responsibility, it may be, with the broken-down father or the always invalid mother now suddenly dependent upon her, she sets out upon this new path with weak, uncertain steps. Beginning a career at forty, all untrained!

The daughter of her washer-woman can distance her; the girl who used to bring home her shoes has already shot far ahead. She scarce used to notice these girls, save when they were thinly clad or looked hungrier than usual. It was easy to loosen her purse-strings or send them into the servants' room to be warmed and fed. Where are they now, while she is halting, timorous, on the sharp stones of the highway? The

washer-woman's girl is a salaried teacher in the model school-house yonder; the other is book-keeper in her father's shop, and it pays her well.

Ah! that artisan father, that mother toiling early and late, had a deeper wisdom in their need than the merchant, the clergyman, the railway king, in his hour of power. What cruelty like to their indulgence now! The unreasoning fondness which reared their girls in luxurious helplessness, which assumed the future as certain in its golden round, has its parallel in other lands. There are Asiatic fathers who put out the eyes of a girl that she may be a more pathetic beggar. To the study of this Chinese prototype we commend the American father who, choosing a career for his boys in the fine freshness of early manhood, leaves his darling daughters helpless amidst the buffets of the changing tide.

Editor's Easy Chair.

THE coincidence of the return from Africa to England of the dead Livingstone and the living Wolseley was the natural subject of comment at the memorial meeting of the Geographical Society of New York. Both had served their native land well, and that land received the victor with acclamation, and the body of the martyr with sympathy and every sign of honor. Both had illustrated that sturdy heroism which is so grateful to the Englishman—the “unconquerable will” which commands fate, the tenacity which made the little island for so long mistress of the seas and the leader of modern civilization. England also, by the honors she offers both to the living soldier and the dead traveler, appeals to a feeling which our own practice leaves very much untouched—the satisfaction in a national recognition of national service. “A peerage or Westminster Abbey!” cried Nelson, as he went into action. He knew that whether he survived or fell he was sure of a visible permanent mark of the honor and gratitude of his country; and this consciousness has inspired many a heart and nerved many a hand which otherwise would not have been so effective.

Nor is it altogether a low or meanly selfish motive. He, indeed, is the loftiest character who in great duties and sore sacrifices utterly forgets himself, and thinks only of the cause, counting his loss gain, and the sacrifice sweeter if his very name perish unknown. The Jesuits in Canada in the seventeenth century, whose noble and heroic story has been so vividly told by Parkman in his *Jesuits in North America*, went beyond civilization, beyond the knowledge and report of men, as it seemed, and, without other witnesses than their tormentors and their fellow-sufferers, endured tortures that soldiers and sailors in dire extremity seldom know. Jean de Brébeuf defied suffering, and made his tormentors frantic by his smiling superiority to pain. For four hours he endured agony before he died, and at the last the savages tore open his breast and thronged to drink his blood, hoping to imbibe some of that transcendent courage. For seventeen hours his companion, Lalemant, survived through the same torture before an Indian, tired

of the long sport of anguish, slew him with a hatchet. They were missionaries, like Livingstone, and, like him, far beyond the usual spurs and motives to heroism. For them there was no peerage or Westminster Abbey. There was no reason to suppose that their fate would be known. Like men sinking in a stormy sea at night, they perished invisibly, trusting only their own hearts and the God they served. The splendor of the battle pales before that greater glory of the Canadian forest. Were soldiers and sailors so inspired, armies and navies would be invincible.

This kind of renunciation, which the heart feels to be the highest reach of human character, has a perfect expression in one of the poems of Tennyson's *In Memoriam*. The mourner, brooding over his loss, and drooping with the sense of personal bereavement, suddenly, in one clear moment of vision, purified and exalted by sorrow, perceives that earthly affection may possibly clog that higher flight, becloud that finer life, and in one of the loftiest strains in literature exclaims:

“Tho' if an eye that's downward cast
Could make thee somewhat blench or fail,
Then be my love an idle tale,
And fading legend of the past;

“And thou as one that once declined
When he was little more than boy
On some unworthy heart with joy,
But lives to wed an equal mind,

“And breathes a novel world, the while
His other passion wholly dies,
Or in the light of deeper eyes
Is matter for a flying smile.”

These are the very divinest emotions of human nature; but other motives, if not so high, are most generous and worthy. The desire of good fame, of kind remembrance, of tender mention, has perhaps the selfish element, but how purified and elevated! And of this regard the peerage and Westminster Abbey are the outward signs. They are national gratitude made manifest. Can you not serve your country for her own sake? asks Gradgrind of Nelson. Are your devotion and your heroism only selfish? “No, no,” answers the brave heart, beating so high,

and so soon to beat no more—"no, no; but as I love my country, so I delight to feel that my country loves me."

This is the moral of "the peerage or Westminster Abbey." They are the symbols of that national pride and love. They are the perpetual monuments of the admiration and honor with which the country regards those sons of hers who serve her faithfully and well. They do not make those sons brave and enduring and successful, but they remind them that if they are so they will not be forgotten. Livingstone, lost in the heart of Africa, intent only upon destroying slavery and finding the sources of the Nile, refusing to return with Stanley, and pushing farther on among the farthest savages—so far away that, dying in May, he is buried in his own land only at the end of April—humble, patient, heroic, devoted, little dreamed that he should lie with kings and poets and statesmen; thought no more at the last that he should ever be buried in English soil, or the date or spot of his death be known, than that he should be honored wherever his language is spoken. What to him was Westminster Abbey? Consciously, nothing. But he was a Briton bred under the influences that have made the nation, and among them, deep, rich, persuasive, inspiring, is the sentiment of honor and recognition for heroic service. We have no Westminster and no peerage. But we too are largely children of the race that has them both, and deep in our character is the same instinct. The selection of the soldier for civic honor, the resolution of Congress that among equals he should be preferred in appointment to office, are signs of the same feeling that knights Sir Garnet Wolseley, and gives him a revenue for three lives, and that sends an honorable deputation to Southampton to receive the body of Livingstone, and consigns it with stately pageant and far-sounding requiem to Westminster Abbey.

THE sudden interest in cremation, or burning, instead of burying the dead body, is one of the striking events of the time. For English-speaking readers the discussion was begun by Sir Henry Thompson, who, as we privately learn, means to push his project to the end unless some prohibitory law shall be found. In this country the debate has been taken up with alacrity, and a bill was introduced into the New York Legislature to incorporate a society for cremation. The quaint old author of the *Religio Medici*, Sir Thomas Browne, is before us all in the matter in his pleasant "Urn Burial." "Though earth hath engrossed the name," says Sir Thomas, with his grave gayety, "yet water hath proved the smartest grave, which in forty days swallowed almost mankind and the living creation." He holds that "carnal interment," or burying, was of the elder date, as witness Abraham and the patriarchs. And "it were without competition if it could be made out that Adam was buried near Damascus." Yet the practice of burning was of great antiquity; for, not to mention Hercules, there are the Homeric obsequies of Patroclus and Achilles, and the "solemn combustion" of Menœceus and Archemorus, "contemporary unto Jair, the eighth judge of Israel." Yet as all customs, he thinks, had some bottom of reason, so had every method of disposing of the body. Those who thought with Thales that water was the original of things

held it better to "conclude in a moist relentment." Others who conceived fire to be the master principle in the composition "declined a visible degeneration into worms."

Then the delightful old scholar recounts the various practices of many nations. The "Indian Brachmans" were too friendly to fire, burning themselves alive. The Chaldeans, idolaters of fire, thought it sacrilege to burn their bodies. The Persian magi, anxious only for their bones, abandoned the flesh to dogs and birds. The ancient Germans burned their dead, but whether not to offend their deity Hertha, or the earth, who shall say? The Egyptians embalmed, afraid of fire, and from such scruples Numa and the Pythagoreans "waved the fiery solution." The Scythians made their graves in the air. The Balerians burned wood over the dead, and the Chinese the same, civilly consuming many prints of slaves and horses instead of exacting the reality. But Christians abhorred this fiery way, except for martyrdom, "affecting rather a depositure than assumption." Thus earth and fire and water have each their arguments and their advocates. But the present interest springs mainly from sanitary fears. The neighborhood of city cemeteries has infected wells, and when once, for any reason, the question is raised, there seems a thousand good reasons of many kinds for its advocacy.

For once sentiment and science seem to agree. Let us soar aloft with Elijah in a chariot of fire! gushes sentiment. Let us decompose the body in the least harmful way! remarks science. There is the usual appalled objection that there is something monstrous and blasphemous in the proposition. There was the same censure of Galileo's opinion that the earth revolved about the sun. Harvey's doctrine of the circulation of the blood and Jenner's vaccination were received with the same alarmed incredulity. And how have medicine and surgery in detail escaped? It is said that Christ was laid in the tomb. But the argument fails, for his body, according to the old prophecy, was not allowed to see corruption. The question is fairly open upon its merits; and should some simple and inexpensive method of cremation be found, there seems to be no reason to doubt that it will be tried. Whether by fire, or water, or earth, the body must return to the dust. Even by the fond deceit of embalming, the final dispersion could only be delayed, not averted; and since science shows that there is no perishing but only changing, sanitary and sentimental considerations alone remain.

In the English burial service the words dust and ashes are supposed to be synonymous. But a severe scholarship distinguishes them. Upon his first visit to England Mr. Sumner was one day at breakfast with a pleasant party at Walter Savage Landor's. The host turned to Mr. Sumner and asked him why General Washington was not buried under the Capitol in the city that bears his name. Mr. Sumner answered him, and ended by saying, "And so his ashes rest at Mount Vernon." "Ashes! ashes!" thundered Landor; "I am surprised to hear a scholar use such a word under the circumstances. Do you mean to say, Mr. Sumner, that General Washington's body was burned?" Mr. Sumner instantly, and with equal spirit, replied, "Mr.

Landor, when I read in the famous verse of a great and scholarly English poet,

'E'en in our ashes live their wonted fires,'

am I to understand that Gray refers to some process of cremation among your English forefathers?"

Dr. Barnard, of Columbia College, in New York, thinks that there would be a natural reluctance upon the part of friends to hasten the inevitable destruction of a beloved form. This also is a natural sentiment, but it is no more; for whether the process be slow or swift no man knows, when that form is hidden from his eyes. And why not hasten that dissolution if it relieve the imagination, since science and religious faith agree that in the dead body only inert matter remains? The soil in St. Innocent's Church-yard, in Paris, was thought to destroy the body speedily; that of Sicily to retain it long. In the Campo Santo, at Pisa, was earth brought from the Holy Land for the more comfortable repose of the body. This is all the plea of the imagination. It is we, not the dead, who know that they lie in one soil or in another, or are consumed by water or by fire. "To live, indeed, is to be again ourselves, which being not only an hope but an evidence in noble believers, 'tis all one to lie in St. Innocent's Church-yard as in the sands of Egypt. Ready to be any thing in the ecstasy of being ever, and as content with six foot as with the moles of Adrianus."

Nothing in our civilization would probably astonish our red predecessors upon this continent more than the post-office. Savages had no news. They had no correspondence. They had no business. Henry Thoreau cherished a secret conviction that they were very much superior to their Saxon successors in America, and insisted that most of our improvements were merely a painful increase of resultless vexation, and that the finer and nobler qualities of human character are no more evident in us than in the red men. But Thoreau loved a paradox, and sometimes confounded civilization with its abuses and diseases. He had a natural sympathy with the Indian, for he had a love of wild nature, nature untouched by art—the primeval forest, the solitary stream, the haunt of the beaver and the fox—and he had a curious knowledge of the aspects of the daily life of the woods and fields, the habits of animals and plants. The Easy Chair remembers a weird night with Thoreau in his boat upon the Concord River, the Musketaquid, in whose neighborhood he found arrow-heads and Indian relics that eluded all other eyes, and seemed to have kept themselves patiently for him. The object of the excursion was to watch the night life of the stream. An iron crate was built out from the bow of the boat and filled with the dead roots of old pine-trees—fat pine—and when this was kindled the blaze threw a broad glare for some distance upon the water, shutting out every thing else, and slowly drifting with the stream we could see clearly every thing below us. We hung seemingly suspended in air over fish and grass and sand, floating imperceptibly upon the current. Thoreau's acute observation, his intimate knowledge, his respect for the Indian, and his much-modified admiration of his own race and time were all very evident.

But this is wandering. To speak of the Indian, however, is to think of Thoreau; and his use of the post-office which they could not understand would certainly not have largely increased the revenues of the government. There is no more striking monument of civilization. In every city the building devoted to its uses is one of the most important, and, in this country, it stands with the custom-house as the visible sign of the larger national government, which, as the well-meaning but confused enthusiast exclaimed, is "the common mother of us all." There is no sight in any great city more interesting than the interior of the post-office. Unfortunately it can not well be made a public resort; but they are fortunate who have been admitted to watch its processes. Dickens took the friends that he most wished to please to see the London post-office, the good order of which is famous. And for New York, it is fortunate that as the post-office is about taking possession for the first time of quarters worthy of it, it is under the superintendence of one of the most efficient officers it has known. There are sly stories told of the quiet way in which he reformed many bad habits in the office when he was first appointed. Thus there were clerks who came very leisurely to their work in the morning, as it has been whispered is sometimes the habit of those who serve that invisible master, the government, and these gentlemen were in no hurry to make the day begin under the new direction at any earlier hour. But, to their amazement, they found if they came at nine o'clock, that the chief was already there. If they were startled into appearing at half past eight, he was still there. If, then, they came at eight, lo! he was there. It was found that the hour of his coming re-arranged the calendar, and business began betimes. The influence of quiet energy is incalculable. The clear, intelligent resolution of the head of a department is felt in every fibre of its administration.

As the citizen and stranger look at the vast building which has been erected for the post-office in New York—occupying a space which should not have been taken, for it has robbed the very heart of the city of sun and air which it has always enjoyed—they will hear with pleasure of the small beginnings of the great system. In 1672 the government of New York authorized a post "to goe monthly from New York to Boston," and invited "those that bee disposed to send letters to bring them to the secretary's office, where, in a lockt box, they shall be preserved till the messenger calls for them, all persons paying the post before the bagg be sealed up." This last is a wise course, to which after many years we have returned. In 1702 this monthly post became fortnightly. Until 1704 the regular post went no further east than Boston, nor beyond Philadelphia to the west. In 1753 Dr. Franklin was Postmaster-General for the colonies, and in 1760 this rash innovator proposed that a mail should run weekly between Philadelphia and Boston, leaving each point on Monday morning, and arriving on Saturday night; and in 1774 he said, upon his removal, that he had made the colonial post-office produce three times as much revenue as that of Ireland.

The history of the English office is very interesting, and is briefly sketched by Mr. Sumner in

a speech upon the franking system. In 1635 letters were carried by carriers or foot-posts sixteen or eighteen miles a day, and it was full two months before answers could be received from Scotland or Ireland at London. The common-wealth farmed out all the posts, inland and foreign, for ten thousand pounds. Under Queen Anne the "cross posts" were farmed to Ralph Allen, who improved the management, upon an agreement that the new profits should be his own for life. But the money was well spent, for it is of this contractor, as Mr. Sumner says, that Pope sung,

"Let humble Allen, with an awkward shame,
Do good by stealth, and blush to find it fame."

The postal revenues were burdened by pensions. The Duchess of Cleveland received £4700 annually, and the Earl of Rochester £4000. Two such facts may perhaps suggest that our own times and country are not so hopelessly worse than all others as certain desponding patriots are wont to imagine. The Duke of Marlborough also enjoyed £5000 charged upon the post-office, "every letter contributing to his annual income." Blackstone thought the post-office a capital method of "raising money upon the subject." But with us the post-office is found to be a convenient scape-goat upon which we lay all the offenses and delays and vexations of our correspondence. If a letter is not immediately received, or if there is any inexplicable event, it is the post-office only that is held to be at fault. This is a great convenience, for it satisfies the natural wish of the mind for enlightenment and explanation. You are in the country, and your town friend asks you to dinner. He receives no reply, and at the hour you do not appear. Of course when you next meet there is coldness, strangeness, possible alienation. To you it is incomprehensible, and you seek a friendly explanation. "Why am I cold?" replies your city friend. "You certainly ought to know. A gentleman who does not even acknowledge an invitation to dinner does not desire to remain upon terms with the inviter." "An invitation to dinner! what do you mean?" "Why didn't you answer my invitation?" "Just Heaven! what invitation?" "The invitation I sent you." "But I have received none." "What!" "None whatever." There is an expressive pause. You rush into each other's arms. You exclaim together, "That [imprecations *ad libitum*] post-office!" And once more you swear eternal friendship. But while the wickedly reckless post-office is thus condemned, the invitation—the *corpus delicti*—is quietly hidden in his hat, where it had slipped under the lining, so that when he posted the others he did not post that.

Poor post-office! When next the reader is vexed by failing to receive a letter, and lavishes his wrath upon the public common carrier, let him consider the true story which follows, and which was told to the Easy Chair by the head of one of the great post-offices. A letter was received by a city bank from its country correspondent, which stated that a draft for a very large sum of money had not arrived. The city bank immediately replied that it had been duly sent. Inquiries were made at both offices. The bank messenger swore that he had posted at the proper hour all the letters given to him for the mail.

The country office swore that it had duly distributed all letters that had been received. But the sum involved was very large, and the matter could not be dropped. The authorities of the city office satisfied themselves that the fault was not with them, and dispatched one of their most accomplished experts to the country office to investigate. He satisfied himself that there was no fault at that point. Thence he went to the country correspondent, and after due inquiry was convinced that every thing was right. So he returned to the city bank, and reported the result of his exploration. "It's all very well," replied the bank, "but we hold you responsible. It shows the shameful carelessness of the post-office." When the bank had spoken, the expert replied, quietly, "That letter has probably never left this bank." There was a sneer of incredulity in answer. "Very well," was the reply, "I have examined every thing else, and now I'll examine you." Due search was made, and between the leaves of a huge account-book the letter was found, properly addressed, stamped, and ready for the mail, but by some chance it had been caught and concealed in the huge book. The hat lining, as it were, and not the post-office, was responsible for the trouble.

Or again, the Easy Chair was once in a great city post-office, talking with the postmaster, when a clerk brought him a letter addressed to a well-known firm, which he said had just been found upon the floor of the office outside. The postmaster made inquiries, and then sent the letter to the firm, with a statement of the facts. The simple truth was that the messenger, having taken out the letter with the others, had unconsciously dropped it, and fortunately it had been at once picked up by honest hands, and returned to the office with an explanation. Had a knave seen it and picked it up, and finding money in it, had he stolen it and destroyed the letter, what a complication of suspicion there would have been! Whether the mail messenger of the correspondent that sent the letter, or the clerks in one of the offices, or the messenger of the firm to which the letter was addressed, were guilty of the apparent larceny, who could have said? One thing only is clear, that the innocent post-office would have been held responsible. *De te fabula narratur!* The gentle reader railing at the wretched post-office that drops, or delays, or steals his letters should look under the lining of his hat.

But the visitor to this most interesting of resorts will find that it is a pack-horse for more than his complaints and vexations. The dead-letter office in Washington and every large city office collects the most curious museum of miscellanies, for the post-office is a kind of parcel express, as well as a carrier of correspondence. The visitor will see yarn stockings, and little shoes, and small boxes, and even little fruit trees, with myriads of other things, retained for want of proper postage. The postal rates are such that dead-weight can be sent by mail for just half the rate at which you can send a book. Almost the entire bullion of the Pacific coast passes through the mails. Mr. Dawes, who tells us these facts, says that a friend of his was in a postal car when the mail-bag was opened, and out rolled from it a huge bolt. It was on its way from Springfield, in Massachusetts, to some large machine-works in Ohio, and its passage in

the mail cost only ten cents. This is evidently an abuse of the post-office, for the object of that characteristic institution of civilization is not to carry parcels, but to diffuse intelligence, whether private news in the form of letters, or public and general in the form of newspapers and magazines and books. The post-office, properly conducted, is not designed for revenue, but for education. It is one of the great educators of the state. Its advantages are so evident and so enormous that its deficit, when its operations have been wisely managed, is one of the most generally useful and unfelt of taxes. It is not primarily a source of revenue. That should be well understood, and then its great benefits can be more wisely ordered. When, under Charles the Second, the franking system for members of Parliament was proposed, Sir Henenge Finch called it "a poor mendicant proviso, and below the honor of the House." The Speaker said, as he put the question, "I am ashamed of it." It was because "the true idea of a post-office was entirely forgotten," and because it was regarded mainly as a source of revenue, that the franking system arose as a legislative privilege. It was defeated in Parliament, but was subsequently interpolated into a contract. And we in this country inherited the false theory of the post as a means of revenue, and the bad practice of the frank as a legislative perquisite.

The law of this far-reaching hand of civilization, the post-office, which of all the departments of the government is the most beneficent and humane, should therefore be cheapness and simplicity. Designed to diffuse intelligence, it should exclude all other duty, and restrict itself to that alone, sure that the smaller the rate, the greater the blessing to the country. Mr. Sumner well asks, in his speech, why, of all the departments, this should be required to be self-supporting. If the army and navy hold aloof the foreign foe, and bind the country together by force, the post-office knits it close with the fine and invincible bonds of sympathy, love, and mutual intelligence. These swift-flying mails, darting by day and night continuously across the whole continent from sea to sea, touching every home and every heart and every mind—what are they but the restless and silent shuttle that weaves the magic web of a nobler civilization?

THE women's temperance revival, as it was called, gradually faded out of the newspapers, and there are not wanting those who ask what was the use of it, and who, like jesting Pilate, stay not for an answer. The use of it is that of all sincere and earnest appeals against conceded wrongs and abuses. When a case is continued in the courts, or the decision is reserved, do we ask what was the use of all this argument and all this testimony? So in the great tribunal of the human conscience and of civilization the case may be continued and the decision reserved, but none the less has the great appeal been heard and the shrewd argument weighed. The women walking in throngs and kneeling at the doors may not all have been free from some lower motive; there may have been love of excitement and of display; there may have been much ignorance and folly and fustian; but what sent them forth—what do you see in the experience of women that should have filled the street with a pray-

ing band? This is the real inquiry. All movements of deep emotion have an unreasonable aspect, if you will choose that point of view. When a hard, cruel, remorseless power held a man in its grasp, and promised him pardon and peace and comfort if he would say certain words, and if not, death for himself and torment for those whom he should leave behind him, why did he not say the words under mental and moral protest, as he would have given his purse to a robber who held the knife at his throat? To the polished, skeptical scholars of Rome the persistence and suffering of the early Christians were the height of folly. What are words, they would have said, when uttered under compulsion? Why not say what the tyrant requires, and enjoy your own spiritual freedom beyond his reach? The same skepticism would easily see what is disagreeable and unhandsome and sensational in the woman's temperance crusade; but neither in the earlier nor in the later Christians could that spirit see or understand the profound and supreme feeling from which the conduct springs.

Think of the tragedy of a single home ravaged by the drunkenness of the husband and father, of the oaths and blows falling upon the innocent and helpless, of the bruised babe, the terror of children who dread the coming of the parent, of the horror and long heart-break of the wife, her hopeless vigils, her endless and useless toil, her hope against hope, and faith against sight, all the light and beauty of life fading away, anxiety, poverty, hunger, despair, crowding swiftly on; think of the daily story of a thousand houses in the city, of the hovels in the town and the country, of the den in which the demon is coiled that works this woe, of the doubts and delays of Legislatures, of the coolness of science, of the practical fatalism that serves as the panoply of every huge evil—and is it wonderful that women any where who had lived for years in the midst of hell go down upon their knees in public or in private, amidst scoffers or among friends, to move the hearts of those who seem to them the authors of their despair? The "use of it" is the appeal that it makes to the conscience and mind of the country, arousing and renewing the conviction that the evil can not be dismissed, can not be left to cure itself, but that every good man and woman must consider how it may best be abated.

It would be very wrong, however, to suppose that there has been no progress in the cause of temperance. The most striking fact in the case is that within a century public opinion has vitally changed. To be drunk was no discredit to a man at the beginning of the century. To offer ardent spirits upon all occasions was the rule of courtesy. To drink copiously was the test of manliness. Within the memory of middle-aged men liquor-drinking at public tables was almost universal. It is so no longer; and there is even a consciousness of opposing public opinion if you order a bottle of wine. This is so true that this pressure of opinion is called tyranny by those who can not escape the consciousness of it, but who resent it. The evasions in the signs of bar-rooms, calling them "sample-rooms" and "wine-rooms" and "saloons," the blinds which surround them, the shame with which so many enter them, all show a universal sense of the stigma which public opinion has placed upon dram-drinking.

It is this public opinion which will be the most powerful element in the reform hereafter, whether it take the form of legal or of moral pressure. But what has affected it in the past, stimulated it, directed it? Will any body deny that it is the agitation which has done it—the agitation whether wise or foolish, whether tasteful or ridiculous? There has been plenty of inconsequence and sophistry and absurdity. But if the world is saved by preaching, and all preaching must be wise to be successful, what a lost world it would be! Certainly it is not the folly which has done the work; it has been wrought by the

profound consciousness of that misery which has driven the women in these last months to pray in the streets, and which no folly of the prayer could conceal. The same consciousness will carry on the work, now under one form, now under another. Each, like the "crusade" of prayer, will have its day. Each will pass by, and Pilate will still ask, "What is truth?" But under all the forms the work will continue; public opinion will be stronger; and only those who do not believe in human progress at all will doubt that the power of that opinion will be as beneficial in this movement as it has been in so many others.

Editor's Literary Record.

THE EDUCATION OF AMERICAN GIRLS.

WHATEVER may be thought of Dr. CLARKE's now famous little treatise, *Sex in Education* (J. R. Osgood and Co.), there can not be two opinions on the question whether it has done good. It has provoked more discussion, awakened more minds, incited to more investigation, than any book of its size which has been published in the past decade. And what is remarkable about the matter is that he has accomplished this not by advancing any new ideas, nor by sustaining old ideas with new arguments, but simply by enunciating in plain terms what a great many mothers had thought before, but had not dared to say publicly. It may be claimed, as it has been, that he exaggerates the difficulty, and fails to prescribe aright the remedy; that American girls are not the degenerate creatures he imagines them to be; and that the causes of such degeneracy are entirely other than those he describes. Still the most determined opponent of his views will be thankful for the intellectual activity they have awakened, and only those will be inclined to complain of him who mistake torpor for conservatism, and object to any discussion of woman's education, work, or place in society. Dr. Clarke's position is a radical and a simple one. It is that persistence is the law of man's being, periodicity the law of woman's being. He claims for her that intellectually she is the peer of man; that she has a right to as high and complete an education; that she has as inalienable a right to do with untrammelled liberty whatever she can do well; that her peculiar physiology, rightly apprehended, is a strength, not a weakness, a glory, not a dishonor; but that, in determining her methods both of industry and of education, her peculiar physiology is to be studied, and her work conformed thereto. The heart and essence of his treatise is found in this sentence: "The best educational training for a boy is not the best for a girl, nor that for a girl best for a boy." And this rests upon the other general principle, that persistence is the law of his being, and periodicity the law of hers. Curiously enough, however, he makes very little attempt to prove this, his fundamental position, and still more curiously, most of his critics make very little attempt to impugn it. The central position of the battle-field is not well defended by the one, nor vigorously assaulted by the other. To support his position we have certain general theoretical considerations adduced, and

a few cases taken from his medical note-book, seven in all, quite too narrow a basis of fact to sustain so fundamental a premise. To attack it we have criticisms on his cases, condemnation of his style, accusations—which we think are quite unfounded—of prejudice, partisanship, and even coarseness. There lie before us as we write three books which have evidently been called forth by his significant little treatise. In the first, *No Sex in Education*, by Mrs. E. B. DUFFEY (J. M. Stoddart and Co.), there is some perception of the issue, but no attempt, at least no successful attempt, to meet it. We have simply assertion set over against assertion. Dr. Clarke says, "It is obvious that a girl.....will not have as much power left for the tasks of the school as the boy, of whom nature requires less at the corresponding epoch." Mrs. Duffey replies, "Nature has supplied her with the extra force and the extra vitality for this very purpose." But neither produces any facts in support of the position maintained, and the impartial reader finds himself in the position of a jurymen compelled to render verdict in a case where there is no evidence proffered, only the contradictory speeches of opposing counsel. The second, *Sex and Education*, edited by Miss JULIA WARD HOWE (Roberts Brothers), is composed of thirteen papers, by different authors, originally published in different journals, in reply to Dr. Clarke's book. Of these articles there are but two that really recognize and meet Dr. Clarke's point. MERCY B. JACKSON opposes hypothesis to hypothesis, with a statement which is left, however, without any support other than its supposed inherent reasonableness, that God has supplied the female organism with a power of more rapid cell growth to meet the peculiar demands made upon her system. The other essay, Mr. T. W. HIGGINSON's, embodies the result, the only scientific result, of the whole discussion as thus far conducted. He calls for a showing, by "careful and discriminating statistics, to what extent girls have been injured beyond boys" by the present systems of education. He points out in detail the particulars on which we need light; and if he does not succeed in furnishing it, which indeed he does not pretend to do, he at least indicates the direction in which we are to look for it. There is now needed, for the true advancement of the true woman's movement, some one with the patience and assiduity of a Darwin to gather up the facts for a well-sustained hypothesis.

Of the various productions which have been evoked by Dr. Clarke's little volume by far the most valuable, indeed the only one which possesses any independent right to life, is *The Education of American Girls, considered in a Series of Essays*, edited by ANNA C. BRACKETT (G. P. Putnam's Sons). Miss Brackett is an experienced teacher of girls, and is well known in educational circles, especially in the West. Her own contributions to the volume before us are by far the most valuable. She is a bold and independent thinker, gives evidence of a wider and deeper study of the educational problems than is generally attempted by even the best of our American teachers, and of a power of digestion and assimilation which is not always the product or even the accompaniment of culture and scholarship. Her first essay, on "The Education of American Girls," physical, mental, moral, and spiritual, comes short of giving complete satisfaction chiefly because she has not filled out her own ideal in it, and we lay down the volume with a sincere regret that she had not given us a book of her own, instead of a collection of essays by various writers, which necessarily lacks that unity that can alone give the highest force to a treatise. In a subsequent essay, "Review of Sex in Education," she is less happy, for she neither apprehends nor replies to Dr. Clarke's fundamental position. "If the one object of the essays is not," she says, "to stay the spread of co-education, we confess ourselves unable to see what it is." And yet Dr. Clarke distinctly, and almost in express terms, disavows objection to "co-education which does not exclude appropriate classification, nor compel the sexes to follow the same method or the same regimen." But incidentally Miss Brackett has done something toward accumulating those facts for which Mr. Higginson calls. The testimonies from Michigan University, Mount Holyoke Seminary, Oberlin, Vassar, and Antioch colleges do not perhaps afford a sufficiently wide basis of fact or a sufficiently disinterested testimony for a scientific determination of the question which Dr. Clarke raises; but they afford a more trustworthy, because a much broader, basis of fact than he has presented, and the comparative health statistics of Mount Holyoke, Amherst, Bowdoin, Brown, Dartmouth, Harvard, and Yale do not sustain the underlying assumption in this whole discussion, that the physical faults of our girls' education are greater than those in the education of our boys. The result of the whole matter is our counsel to such of our readers, whether parents or teachers, as have any direct responsibility for the education of an American girl, to read, though with caution, Dr. Clarke's book on *Sex in Education*, and to follow it with Miss Brackett's book on *The Education of American Girls*. The others may be safely left to repose in the oblivion to which they are certain to be consigned.

HISTORY AND TRAVELS.

OF Mr. SCHWEINFURTH's remarkable book of travels, *The Heart of Africa* (Harper and Brothers), it is scarcely necessary for us to say much here, since so full an account of his explorations has already been given in these pages. As an explorer Mr. Schweinfurth ranks second only to Livingstone and Sir Samuel Baker. As an au-

thor he has one qualification, and an important one, which neither of them possessed—he is an accomplished draughtsman. The products of his skillful pencil are seen in the abundant illustrations which enrich the two volumes devoted to an account of his travels and adventures in Central Africa. Apart from the interest which such a work has to the simple reader, the interest of romance and adventure, it is valuable to the student and to the philanthropist: to the student, because it opens up studies of human nature in phases of development which are perplexing to our common philosophy of the nature, the origin, and the destiny of man; and to the philanthropist, because it points to the causes which have enabled the barbarism of Africa heretofore to keep civilization at bay, and the possibility of a not far distant day when it will yield its material wealth to modern civilization, and its aborigines to the conquering influences of Christianity.

Our readers have already enjoyed in the pages of this Magazine a taste of Mr. CHARLES NORDHOFF's new book, *Northern California, Oregon, and the Sandwich Islands* (Harper and Brothers). This will be the best incentive to its further perusal. To such as have read his articles we need only say that the book is all they might expect it to be. Mr. Nordhoff has a peculiar genius for seeing what other people want to see, and setting it before them with a photographic accuracy. To read his pen-pictures of life at the Sandwich Islands, of the fruit and dairy culture of Northern California, and of lumbering, is the next best thing to a personal visit to the country itself. Mr. Nordhoff is a thoroughly independent writer, and though all men have prejudices, he has an ability greater than most men possess of laying his prejudices aside, and seeing the truth and making fair report of it. He has no national enthusiasm for what he calls the "incorrigible Puritans," but he does not close his eyes to the fact that the revolution wrought in the Sandwich Islands is due to their "remorseless determination." He certainly has no Puritan principles against a glass of home-made wine, but he is none the less ready to record his deliberate judgment that wine-raising involves for the owner "too many risks with children and laborers, even if he himself escapes" the contagion of drunkenness. In brief, Mr. Nordhoff's book has all the elements which give value to a book of travels. He has visited a region about which all Americans ought to know more than they now do; he has observed narrowly and carefully its civilization, industry, and social life; and he has written of what he has seen with a fearless and an impartial pen. The book is elaborately illustrated, and is attractive in external appearance as in contents and interior character.

RELIGION.

THE fact that as we write Professor DAVID SWING, of Chicago, is undergoing trial on charge of heresy will give to his *Truths for To-Day* (Jansen, M'Clurg, and Co.) a peculiar interest. But they do not need any such ecclesiastical impetus to give them both acceptance and value. As a religious teacher Professor Swing is one of the products and exponents of an age that cares more for spiritual life than for doctrinal expres-

sion, for the blossom and the fruit on the tree than for the box which is supposed to be necessary for its protection. It is this fact which primarily has given him his great pulpit popularity, as it is this fact which has brought upon him theological odium. Like Henry Ward Beecher, F. W. Robertson, James Freeman Clarke, Dean Stanley, and a score of other divines of the present generation, he belongs to no particular church, but to the whole Christian brotherhood, and demands for those who are separated from him intellectually, but not sympathetically, the same largeness of religious liberty that he claims for himself. That he has departed somewhat from the "old landmarks" he does not deny; that he is interested in the modern aspects of truth the very title of his book indicates; that religious belief rests not upon external evidence, but upon personal experience, he expressly affirms; that love toward God and good-will toward man are the essentials of religion he repeatedly re-asserts. He appeals not to authority, but to intuition; never to the church, and less frequently to the Bible than to the consciences of his hearers. He is occasionally mystical, if not foggy. What, for example, he means by his definition of faith as "the moral drift of the heart" he would possibly find it difficult to explain. But in the main his thoughts are clear, even if not logically defined, and his style is always crisp, and often sparkling. He is a poet rather than a logician, and reaches the hearts and consciences of his readers not by a circuitous route through the reasoning faculties, but by a direct appeal to their own spiritual consciousness. We have read his sermons with intellectual and spiritual profit to ourselves, and we cordially commend them to others, without assuming to judge what occult heresies may be hidden away in them.

It is difficult to avoid a disagreeable impression of egotism in Canon KINGSLEY's *Westminster Sermons* (Macmillan and Co.). In his introduction, in a passage of twenty-five lines, we count twelve uses of the first personal pronoun, either as "I," "we," or "our;" and we are disagreeably impressed with the fact that there are other pages where the personality is made quite as prominent. Nor on still further reading do we find that spiritual fervor which kindles the heart, or that spiritual insight into Scripture which clarifies the vision, and enables us to see God more clearly in a glass from which the dust and cobwebs of scholastic lore have been cleaned away, nor that strong conviction of spiritual truth which compels conviction by sympathy rather than by argument, nor a strong man's settlement of doubtful disputations, so that, after the reading, doubts disappear. We find sermons which are essays rather than sermons, and which are notable chiefly for the strong semi-animal courage of the speaker, and for his love of nature, and for the religion and theology which have their roots in nature, and find their interpreter, perhaps their chief interpreter, there.

The radical and fundamental question whether the Bible, with the religion it inculcates, is a development of human thought or a gift from God to man, HENRY ROGERS discusses with decided ability in *The Superhuman Origin of the Bible inferred from Itself* (Scribner, Armstrong, and Co.). The course of his argument is not original, and its power lies rather in the accumu-

lation of reasons than in the presentation of any thoughts that are absolutely new. There is, indeed, little or nothing new to be said on this subject; but a clear and compact statement of the grounds of Christian faith in the Bible as a superhuman production, directed to the current of modern thought, is needed, and that the author of the *Eclipse of Faith* has presented here in a spirit of candor, and in a style that is vigorous without being trenchant.

POPULAR SCIENCE.

THE publishers of *A History of North American Birds*—land birds—three volumes (Little, Brown, and Co.), have produced a work which externally is worthy of its subject and subject-matter. Typographically it is very nearly perfect; artistically it is not less so. It contains sixty-four plates of heads and 598 wood-cuts of birds. These last are not only exquisite in design and execution, they are also wonderful as portraits, in representing not merely with a mathematical accuracy the properties of each bird, but also with a true artistic accuracy the spirit and life and consequent expression of each bird. The outline drawings will prove hardly less attractive to the student than the engraving to the general reader. These outlines present in a very clear and compact manner a distinct idea of the forms and the characteristic features of each species—the bill, the wing, the claw, the feathers, the tail—so that the student who has once mastered the method can at a glance compare the features of different species as though he had them before him. The work is the joint product of three men, whose superiors in ornithology it would not be easy, or perhaps possible, to find—Messrs. S. F. Baird, T. M. Brewer, and R. Ridgway. In addition to the published but scattered material, which has not before been made available to the ordinary student, there is a large amount of manuscript contained in the archives of the Smithsonian Institution, in the form of correspondence, elaborate reports, and the field notes of collectors and travelers, which has been made to contribute to this work. The technical and descriptive matter has been contributed by Messrs. Baird and Ridgway, the former of whom is well known to ornithologists by his previous publications, especially Vol. IX. of the *Pacific Railroad Reports*. The more popular accounts of the habits of the birds are furnished by Mr. Brewer. These descriptions are to be specially commended for clearness and conciseness of style and compactness of thought. There is nowhere manifest that tendency to rhetorical looseness and flow of words which so often, we may almost say so uniformly, characterizes all popular descriptions of either birds or flowers. Indeed, that which, next to beauty of appearance and convenience of arrangement, impresses us in opening these volumes is the marvelous amount of information compacted into so small a space. While the reputation of the authors renders the work an authority, its comprehensiveness leaves little or nothing to be desired in the way of supplemental information; and it is hardly probable that even further investigations will for many years, if ever, supersede what is now certainly the most complete work of its kind in this country, and has probably no superior, perhaps no equal, in European publications.

But we can give the non-scientific reader a better idea of the book by illustrating its use in a single instance. We are considering the question of introducing into our own grounds the English sparrow. There are rumors that it destroys the blossoms, drives away native birds, and does not kill the worms. We turn to this book for information. An index of English names refers us to the volume and page. There we find it placed under the general class of finches (*Fringillæ*), of which there is at the commencement of the chapter a general description. Following along the chapter to the house sparrow, we find first a concise description of it, outline drawings showing the shape of tail, wing, claw, beak, and feathers, a careful and painstaking account of its colors, and then in three pages a description of its character and habits, with a history of its introduction into the United States. We find that it destroys the eggs, worms, and pupæ of the insects that infest our fruit trees; that it lives peaceably with other birds, except that it robs the robin of his food; and that it is "hardy," enduring the severest winter without apparent inconvenience or discomfort; and finally, turning to the index of plates of heads, we find a life-like portrait of the head of the sparrow, which represents, as we have said, not only the contour of the head, but the very expression of character which belongs to it. The indexes to the work are very complete. A fourth volume is promised at an early date, to contain the water birds of North America.

NOVELS.

Lady Anna (Harper and Brothers), Mr. ANTHONY TROLLOPE'S last novel, is a pure love-story, and one of a description which it would be impossible to weave out of any elements afforded by American society. It requires some effort of imagination on the part of a democratic reader to understand why the Countess should have such an ineradicable aversion to Daniel Thwaite, her daughter's lover. It requires some sympathy with English social caste to appreciate the gulf which seemingly separates them, but which true love bridges at last. The gradual influence of such fiction must be to weaken the dividing lines, and make transition from the commoners to the aristocracy more and more easy; and on just such social problems no inconsiderable proportion of English novels really turn. Apart, however, from its interest as a statement, if not a discussion, of a social problem with which Americans are only indirectly interested, *Lady Anna* is a love-story of unusual interest. The reader never loses his sympathy with the persecuted girl or his hope for her plebeian lover, and the novelist has succeeded in painting the resolution of the former without in the least impairing those feminine charms which are essential to an attractive heroine either in fiction or in real life.

A very different sort of a love-story is *My Mother and I*, by Miss MULOCK (Harper and Brothers). It is a very quiet story, with little plot, and with little of the passion which novelists very generally, and young ladies very often, mistake for love; a quiet story, such as Miss Mulock likes best to write, and her admirers like best to read; a story in some sense sad in its close, yet not melancholy; one from which every reader will rise with a higher ideal of true

love, and a higher appreciation of its value, not for what it brings, but for what in itself it is.

Those who have read with pleasure the former books by FRANK LEE BENEDICT will welcome *John Worthington's Name* (Harper and Brothers), and will recognize in the strong points of the book the same evidences of talent that were shown in the preceding volumes. Mr. Benedict is unmistakably fond of delineating womanly failings and excellences. His characters grow and develop in his hands with marvelous semblance of reality. The shocking sins which startle a community are but the fruit of a gradual development, and a weak point in the character suffered to grow weaker will give way before an assault of temptation. At the risk of being numbered by Mr. Benedict among the dyspeptic critics to whom he humorously alludes, we shall venture to suggest that he can fairly afford to leave romantic coincidences of meeting to writers possessing less true genius. There is also a flippancy remark now and then in the earlier part of the book which is not in keeping with the true and unmistakable moral tone of the story.

Whatever other quality Mrs. REBECCA HARDING DAVIS may lack as a writer, she can not be accused of being deficient in strength. In *John Andross* (Orange Judd and Co.) she shows her ability to bring corporations, "rings," and politics into her service for working out the purpose of her story. For pleasant reading this book contains rather too much and too deep rascality. The characters are living people, not lay figures, but are too generally not pleasant acquaintances. The story seems overburdened with material.

There could scarcely be a greater contrast to Mrs. Davis's book than *Thorpe Regis* (Roberts Brothers). Instead of strong and bold strokes, there are dainty touches. The story is not a startling one, nor is it tame to one who enjoys watching the growth of character and the play of mind on mind and heart on heart. The tragedy of a disappointed and a misunderstood hope and love is delineated with delicacy, but with an appreciation which redeems it from weakness. The writer, who is only known to the American public as "the author of *The Rose Garden*," is a lover of flowers, and the book is one to be enjoyed out-of-doors on a quiet summer day.

MISCELLANEOUS.

DIO LEWIS'S *Five-minute Chats* (Harper and Brothers) is a capital book to leave on the dining-room mantel-piece, and catch up to read while waiting for the assembling of dilatory members of the family. It has several qualifications for such a service: it is composed of short juicy paragraphs, ranging from two or three lines to two or three pages; it is thoroughly good-humored, and reproves your follies and corrects your faults without disturbing your own serenity or impairing your digestion; and it treats of health—a subject on which we all need instruction—"line upon line and precept upon precept," for which, however, we imagine we never have time till our constant violation of the laws of health lays us on our bed, and the doctor comes to teach us how to recover from the sickness into which we never ought to have fallen.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

DURING the month of April there has been discovered one new asteroid, number 137, found by Palisa, at Berlin, on the 20th of the month. That announced by him on the 25th is, according to Tietjen, identical with Fortuna, or number 19. The second comet of 1874 was first seen by Winnecke, at Strasburg, on the 12th of the month; and on the 17th, Coggia, at Marseilles, discovered the third comet of this year.

In the method of computing the absolute perturbations of the movements of one planet by the attraction of another, Mr. G. W. Hill, of the *Nautical Almanac* office, offers a valuable suggestion, in that he calls attention to the notable abbreviations which are produced in some parts of the formulæ by the introduction of the true anomaly as the variable, according to which the integrations are to be executed. The method is a modification of those of Laplace and Hansen, and the labor of the work is materially less than in the methods formerly applied.

Lord Rosse contributes to the monthly notices of the Royal Astronomical Society of London an interesting paper on the spots on the disk of Jupiter, as observed with his six-foot reflector during the past year. A large number of unusually accurate tinted drawings accompany the paper, and the attempt has been made to deduce both the time of revolution of the planet and the movement of the spots on the surface. There seems no doubt but that these latter are of the nature of clouds in Jupiter's atmosphere.

The remarkable series of dates of solar and lunar eclipses observed by the Chinese during the past twenty-five hundred years, and published a few years ago by Mr. Williams, of London, has attracted the attention of Mr. J. N. Lewis, of Mount Vernon, Ohio. This gentleman, who is known as one of the most cultivated of American amateur astronomers, has prepared solar and lunar tables of sufficiently approximate exactness to enable him to compute the circumstances of an eclipse with great ease, and has undertaken to deduce in detail the results for each of the eclipses recorded in the Chinese annals. The importance of this great work can not be too highly estimated, and should it be extended so as to include every possible eclipse since the beginning of the records of Assyria and Egypt, it would add materially to the precision of our knowledge of the chronology and the science of those ancient times, besides giving a better insight into the usefulness of certain ancient eclipses in improving our knowledge of the movements of the earth and the moon.

In reference to the approaching transit of Venus, Lord Lindsay announces that his nights will be devoted while at the island of Mauritius to observations of the planet Juno, whose opposition occurs in November, in hopes that he may by these determine the solar parallax with an accuracy but little inferior to that resulting from observations of the transit.

The movements of the fixed stars toward or from the earth has, as is well known, formed the subject of a long series of brilliantly successful spectroscopic investigations by Huggins, of London. This gentleman has now contributed an

equally valuable memoir to the Royal Society of London, detailing the results of his attempts to apply to the nebulae a similar course of observation. The difficulties in the way of such an investigation were excessive, and it does not appear that the eminent observer has as yet been able to satisfactorily conclude more than this, viz., that none of the nebulae show a motion of translation of more than twenty-five miles per second, including the earth's motion at the time of observation. The gaseous nebulae, as a class, have not proper motions so great as many of the fixed stars.

The scintillation of the stars has become a very interesting subject of investigation since the application of the spectroscope to this phenomenon by Respighi a few years ago. The latest contribution to this study is by Montigny, of Belgium, who concludes that the "frequency of variations of the colors of stars in scintillation is generally in relation with the constitution of their light according to spectral analysis." Montigny confirms Dufour's law that the red stars scintillate less than the white ones, and explains it as due to the fact that the total separation of the colored bundles of rays by atmospheric dispersion is greater in the case of a red star.

Professor Wright, of Yale College, contributes a highly important memoir on the polarization of the light of the zodiacal light. By means of very delicate apparatus of his own construction he establishes beyond reasonable doubt the fact that the light in question is polarized in a plane passing through the sun to the amount of fifteen or twenty per cent., and that therefore, as its spectroscopic examination shows it to be not perceptibly different from that of the sun, it must be considered as being reflected to us from a crowd of small bodies (meteoroids) revolving around the sun in orbits not far removed from the ecliptic. Such a ring might appear to a person on a neighboring star to have a nebulous aspect, and doubtless some of the ring nebulae, as well as Saturn's rings, have very similar constitution.

In *Terrestrial Physics* it is worth while to note that the recent seismic disturbances in North Carolina have been the subject of careful study by Professor Duprey, of that State, who states that there is no evidence whatever of volcanic action, and that the shock and noises proceed from the interior of the base of the mountain, and are of the nature of slight earthquake shocks.

One of the finest auroras of the past years was observed throughout the northern portions of the United States on the 7th of April. Simultaneous magnetic disturbances were reported in France.

At the recent meeting of the National Academy of Sciences Professor Loomis presented a most valuable paper on the movements of storm centres in America, and one that ranks in importance with those of the European meteorologists Mohn, Hildebrandsson, Maydell, etc. The numerous generalizations deduced by him, while in part confirming those previously announced by Espy, Redfield, Ferrel, and Abbe, embrace also many entirely new ideas, and in all respects surpass those of his predecessors by the definitely accurate nature of his results. Perhaps the most

novel of the rules deduced by Loomis are that the storm track is in the axis of the region of greatest rain-fall, and that the storm centre moves most rapidly when the westerly winds in its rear are the strongest.

The German government has, it is asserted, taken steps toward the establishment of a permanent commission on ocean meteorology, and the director of the London Meteorological Office announces that a general international convention will be called during the coming year to consider especially the questions of maritime meteorology—a subject that certainly demands immediate special attention.

To the *Chemist* the month has been remarkable for the amount of good work done in inorganic chemistry. Of this perhaps the most noteworthy portion is the discovery, by Professor Wolcott Gibbs, of Harvard University, of a metameric series of seven compounds in the ammonio-cobalt group—the first case of metamorphism yet observed in the inorganic kingdom.

Cleve has continued his researches among the rarer metals, and now describes many compounds of lanthanum. To this metal he gives the atomic weight of 139.15, regarding it as triatomic. Lanthanum, cerium, didymium, yttrium, and erbium are, according to him, all triatomic metals, and form a special group by themselves.

Crookes has completed a long and exhaustive series of experiments to determine the atomic weight of thallium, and has reached the value 203.642. No more thorough work of the kind has ever been done.

Not many years since the world was startled by Graham's discovery of metallic hydrogenium, as he named the hydrogen occluded by palladium. This occluded hydrogen has just been re-examined by Troost and Hautefeuille, who regard it as uniting with the palladium to form a definite hydride, Pd_2H . A similar sodium compound is also described by them, having the formula Na_2H . In these compounds the specific gravity of the solidified hydrogen appears to be 0.625, water being unity.

A strange occurrence of crystallized silica has been noted by Hübner of Rostock. While preparing some specimens for microscopic purposes from Görlitz brown coal, he noticed in the coal peculiar minute crystals, six-sided columns pointed at both ends. From one kilogram of the coal he obtained three grams of these crystals, which proved to be quartz. He failed to find any thing similar in other brown coals.

A very curious observation has been made by Oscar Loew, the chemist of the Wheeler expedition. In quite a number of plutonic rocks from the far West he has detected minute quantities of cobalt and nickel, metals probably never before found under such circumstances. Both were found in basalt from the Gila River, while cobalt alone occurred in rhyolites from the Peloncillo Mountains, Arizona, and the Burro Mountains, New Mexico, and in trachyte from the Sierra Calitro, Arizona. In this connection it is also worth while to mention the discovery by Dr. Endlich, of the United States Geological Survey, of native tellurium among some ores from the Red Cloud Mine, Colorado. Until this discovery was made, only one locality for this rare mineral was known, namely, near Nagy-Ag, in Transylvania.

The spectrum of exploding gun-cotton has been examined by Lohse. Many bright lines were noticed, but of course could not be readily studied. These lines were remarkably widened, the extent of the widening being apparently dependent upon the violence of the explosion.

In organic chemistry there is little worth noting. Steiner has effected a new synthesis of succinic acid, and Gladstone and Tribe have continued their experiments with the "copper-zinc couple." This time their investigations relate to the action of the couple upon allyl-iodide.

Announcements in regard to *Geological and Mineralogical* subjects have not been very numerous, although various details of local importance have been published; and in the United States there have been some reports of the geological surveys of States, among them that of New Jersey, under Professor George H. Cook. This is especially valuable in its connection with the mining and agricultural resources of the State. Two new mineral species have been announced since our last, namely, horbachite and schrockingenite.

The approach of the season for active operations in the way of *Explorations and Researches* in the United States is marked by the note of preparation, and although it is not likely that as much will be accomplished this year as in 1878, there is yet a reasonable prospect of a satisfactory advance in our knowledge of the West. The parties of Lieutenant Wheeler of the Engineer Corps and of Professor Hayden of the Interior Department are making ready to start as soon as the necessary preliminaries have been completed. Professor Powell, who has accomplished so much in his exploration of the cañon region of the Colorado, hopes also to have the opportunity of completing his field work before the next meeting of Congress.

Mr. William H. Dall, of the United States Coast Survey, left San Francisco on the 20th of April for his season's work, which includes a survey of Cook's Inlet and Bristol Bay, and of the general coast as far north as and including the islands of St. Michael and Nunivak. His special object is the determination of magnetic phenomena and the preparation of a coast pilot. A law has been passed by Congress authorizing the prosecution of researches into the natural history and geographical distribution of the fur seals, and Mr. Henry W. Elliott, so favorably known by his explorations in the Pribylov Islands, has been appointed to this duty by the Secretary of the Treasury. In accordance with the law, he will be accompanied by an officer of the navy, whose more especial duty will be to look after the affairs of the Alaska Commercial Company, and to determine whether they have complied strictly with their contract with the United States.

The account of an exploration of Lake Ochobee, in Florida, as prosecuted during the last winter under the auspices of the *Forest and Stream* newspaper, has been published in that journal, the party consisting of Mr. Frederick J. Ober, Dr. Edward Palmer, and others. They give a rather more definite and much tamer idea of the character of the lake and its natural history than was previously asserted to be the case, their examination dispelling the prevailing fictions as to the existence of ruined buildings, remarkable objects of natural history, etc.

The re-examination of various routes for a canal across Central America from the Atlantic to the Pacific has been completed, and the parties at last advices were on their way back to the United States. It is now likely that at an early date we shall receive full reports, with a statement of the line selected by the committee as considered preferable to the others.

Mr. Osbert Salvin, an eminent English naturalist, well known for his explorations in Guatemala several years ago, has recently returned from a second visit to that country with much additional information respecting its physical and natural history.

Several valuable reports of explorations prosecuted in previous years in America have lately been published. One of these, by Lieutenant Ruffner, of the United States Engineers, at the order of General Pope, gives an account of a reconnaissance into the Ute country, made during the past summer. The report of Captain Selfridge on the ship-canal survey across the Isthmus of Darien has appeared in a well-illustrated quarto volume. The official report of the expedition of the *Polaris*, as obtained from the examination of the various members, has also been published by the Secretary of the Navy, accompanied by a large chart, showing the geographical discoveries made by the expedition.

The arrival of the *Challenger* at Melbourne, after having left South Africa, has been already communicated, and the astronomical world is waiting with much interest the report she brings of Macdonald's Island, Kerguelen Land, and other localities visited, as to their fitness as stations for the observation of the transit of Venus.

Beccari, the intrepid Italian explorer, has commenced the survey of certain little-known parts of Sumatra, and is likely to add to the reputation which Italian explorers have attained within the last few years by their energy and enterprise.

The completion of Gerhard Rohlfs's exploration of the Desert of Sahara and his return to Cairo is announced, although no details of his observations have come to light since his arrival at the Oasis of Dachel.

Messrs. Behm and Wagner have published their annual summary of the population of the world, as obtained by the latest reports and estimates, the footing for the year 1873 amounting to 1,300,000,000 souls.

In *Zoology* we have to announce the discovery of a new bed of the bones of the ancient extinct moa or *Dinornis* of New Zealand, which bids fair to add considerably to the means of illustrating these giants of the feathered tribe in the public museums of Europe and America. The National Museum at Washington was enriched last year by the receipt of several skeletons from the Canterbury Museum, and a still finer series has lately been purchased from the same establishment by the American Museum of Natural History in New York. These with the large series in possession of Professor Marsh, of New Haven, and the scattered specimens in other museums, are sufficient to give a very fair representation of this group in the collections of the United States. Fuller details are published of the fossil bird in the London Sheppey clay, recently described by Professor Owen as *Odontopteryx toliapicus*, a characteristic feature of which

consists in the teeth-like processes on the edge of the upper jaw. These, however, are not distinct teeth implanted in sockets, as in the *Ichthyornis* of Professor Marsh, but only dentary processes.

Professor Cope and Professor Marsh continue the announcements of their discoveries of fossil vertebrates in the tertiary and cretaceous beds of the West, all classes of vertebrates being represented, and the variety so great as to render it impossible to give any special indications in our brief abstract.

Reports have been published by Mr. Dall and Mr. Henry W. Elliott upon the natural history of the birds of the Aleutian and Pribylov Islands, adding much to our knowledge of the character of the aquatic species of the North Pacific.

The natural history of man continues to excite the special attention of ethnologists, whose researches are continually being rewarded by the discovery of remains of his skeleton or of his handiwork. A new bone and prehistoric cavern has been found at Macarsca, in Dalmatia, and another in Switzerland, the latter said to have furnished the best specimens of carvings of prehistoric animals, such as the reindeer, etc., yet brought to light.

The pretended discovery by Calvert of human prehistoric handiwork in the miocene of the Dardanelles near Constantinople proves to be unfounded, the supposed tracings on a piece of bone turning out, it is stated, to be merely the eroding work of some crustacean.

In our own country the shell heaps of the Pacific coast have been prolific in treasures of stone and bone, indicating the opening of a new field in this direction.

The vague traditions in reference to the nurture of human children by wolves, which, beginning with the story of Romulus and Remus, have continued down to the present time, have, it is alleged, been fortified by three recent cases in India, young persons of both sexes having been found inhabiting caverns in company with wolves, and when captured exhibiting all the untamable ferocity and peculiar habits of their foster parents, going on all fours, gnawing of bones, eating of raw flesh, etc.

The meeting of the International Congress of Prehistoric Ethnology and Archaeology is announced to take place at Stockholm on the 7th of August, and a large attendance is expected from all parts of Europe. It is greatly to be regretted that so few representatives from America have hitherto been present at the meetings of this important society.

The subject of *Agriculture and Rural Economy* continues to occupy the attention of all civilized nations, but although a great variety of announcements of discoveries are made, these are either reproductions of what has been already noted, possibly in some other quarter of the globe, or else are so limited in application as not properly to be the subject of so brief abstracts as ours. We may, however, mention that the rapid diminution of American forests, and the influence of this change of physical condition upon climatology, and especially upon drainage, has recently attracted the attention of Congress, and a bill has been introduced for the establishment of a commission, with a view of investigating the subject and reporting upon the extent of the evils and a remedy for them.

The threatened exhaustion of the guano beds on the Peruvian coast, which have so long been the chief source of support to that nation, has been a subject of grave apprehension both to Peru and to the nations which have depended upon her for this important fertilizer. Recent explorations of the coast of the main-land, however, have revealed the existence of new beds, embracing many millions of tons, even richer in nitrogen than those of the Chincha Islands.

A movement is now being made to introduce the prairie-chicken, or pinnated grouse, into various waste tracts in Europe and America, and with probable success. It is stated that a few years ago several pairs were transferred to a district in Maryland, and that in consequence of proper protection the progeny already amounts to several thousands.

The movement toward the establishment of an agricultural experiment station in Connecticut, which was initiated at the annual meeting of the State Board of Agriculture last December, has been progressing quite favorably. During the winter a large number of farmers' conventions have been held throughout the State, in which the matter has been set forth, and very encouragingly received, the intelligent and enterprising farmers giving it their hearty and earnest support. The project has also been brought before the people through the press of the State, and by the publication and circulation of addresses bearing upon the matter. It is expected that a strong effort will be made to induce the Legislature to provide means for the establishment of an experiment station in Connecticut.

We are much pleased to note a "Report on the Analyses and Estimation of Value of ten different Commercial Fertilizers for the Georgia State Agricultural Society, by H. C. White, Professor of Agricultural Chemistry in the Georgia State College of Agriculture and the Mechanic Arts." This report, following the example introduced into this country by Professor Johnson, chemist of the Connecticut Board of Agriculture, estimates the relative values of different fertilizers, by computing, by a scale of prices assumed to be fair for that market, the values of the fertilizing ingredients which they are found by analysis to contain. The assumed scale of values is quite liberal to the dealers; and in certain minor points, as in the discussion of the relative values of different potash salts and of soluble and reverted phosphoric acid, the report is perhaps open to criticism. But a very valuable point is gained in that the principle of the valuation of fertilizers upon the basis of their chemical composition is set forth, and the analyses are made in behalf of the farmers, at the instance of the State Agricultural Society, by the chemist of the State College. The farmers of Georgia appear to be taking a step in the right direction to secure good fertilizers, and their agricultural college is doing very creditable work to aid them.

The analyses of fertilizers, for the purpose of control of the trade in these articles, are becoming year by year more common, and their necessity better understood. In the experiment station at Halle, in Germany, the number of these analyses made annually has been increasing, until now it is over one thousand. In the laboratory of Professor Voelcker, of London, chemist of the Roy-

al Agricultural Society of England, where analyses of fertilizers are made for members of the society and others, the amount of this work has grown to such a degree that five or six assistant chemists are employed, who analyze about two thousand samples per year.

Experience, as decisive as it is costly, both in Europe and in the United States, has shown that the only means for regulating the trade in commercial fertilizers, and preventing immense frauds, is that the buyers know the quality of the goods they purchase, that this can be determined only by chemical analysis, and that complete security must be sought in analyses made by parties working in the interest of the buyer.

In this connection it will be interesting to notice an account given by Dr. Maercker, director of the experiment station at Halle, in Prussia, of the fertilizers at the Vienna Exposition. The principal articles exhibited were, potash salts from the mines at Stassfurth, in Germany, phosphorites from Europe and America, superphosphates, guanos, ammoniacal preparations, and Chili saltpetre. The artificial fertilizers were mostly of German and English manufacture. The German wares were in general unmixed, and were accompanied by strict guarantees of their composition, which fact corresponds with the German practice of buying fertilizers containing known quantities—potash, phosphoric acid, or nitrogen—separately, and mixing them at discretion. The English fertilizers, on the other hand, were generally mixtures of these various fertilizing materials, and were sold as "turnip fertilizers," "wheat manures," etc., thus rendering the control upon the contents of fertilizing ingredients more difficult. From a comparison of the English and German wares Dr. Maercker is impressed with the idea that the German farmers judge more rationally than the English as to what each individual crop needs, and with justifiable pride attributes this to the study of agriculture in the German agricultural schools and universities.

The European experiment stations continue their usual activity. The last official report of the Prussian stations shows that the number of these, including laboratories devoted to investigations in animal and vegetable chemistry and physiology, is over twenty, while the revenue of the stations for the year 1872 was 49,374 thalers, or over \$35,500 in gold.

Accounts from Switzerland show that there are in that country, 1st, the so-called "Alpine experiment stations," four in number, commenced in 1868, for the purpose of making experiments with fertilizers; 2d, a station for dairy economy, established in 1872, at Thun; 3d, a station in process of establishment in connection with the agricultural department of the Polytechnic School at Zürich; 4th, the establishment for investigations in agricultural science maintained by Mr. Riser on his estate of Calèvres, near Nyon. In addition to this, various agricultural societies make arrangements with the laboratories of the schools of science for the analyses of fertilizers, in the exercise of a control over the trade in those articles.

The subject of *Pisciculture and the Fisheries* continues to occupy a great share of public attention, and the number of States having commissioners to look after the fisheries promises to

increase, although no new names have been added to the list since our last statement. Reports have appeared, however, from the Commissioners of Rhode Island, Connecticut, New York, Ohio, and California, giving satisfactory accounts of the work done. The shad appear to be unusually abundant during the present season on the coast of the United States, the result, in all probability, of the efforts taken by the various States to increase their number. It is said that the Hudson River is better provided with fish than for many years past, the wholesale value being scarcely greater than on the Potomac River, where the supply has always been quite ample.

The recent capture of several full-grown shad in California is the practical earnest of the success of the operations which have been undertaken to introduce this fish into new waters. The question of the food of the shad in the ocean has recently received a partial illustration by the capture of several fish on the Delaware River with their stomachs filled with minute crustaceans, probably of the genus *Mysis*.

Many years ago eggs of the salmon were carried from London to Australia and Tasmania, and there bred in ponds. Although the persistence of the fish in the Derwent River and other Tasmanian streams has been maintained, their positive existence has not been proved until recently, when a salmon was, as is reported, actually taken and sent to London for identification. Another part of the experiment, that of introducing the sea trout, has been perfectly successful, fish of several pounds in weight having been recently captured, their number having increased so rapidly that they already constitute quite an important source of the food supply. The same may be said of the European brook trout.

The distribution of salmon eggs from the United States establishment at Bucksport to the various State Commissioners has been completed, and in most cases the young fish have been placed in the waters for which they were ultimately intended. The Commissioner of Fisheries of Canada has lately caused to be advertised a list of streams in Canada which are offered to parties for salmon-fishing, at minimum sums of from \$20 to \$500 each.

In the department of *Engineering* we may record the progress of a number of domestic and foreign constructions, as well as the projection of numerous new works.

Upon the Illinois and St. Louis Bridge the work upon the roadway and on the eastern approaches, according to the latest published reports, is progressing favorably. The bridge was expected to be ready for use and the eastern approaches finished during the month of May. No time for the completion of the western approaches can yet be fixed.

The project of bridging the Detroit River may be considered as making progress. A general convention of representatives from all parts of the State, lately held at Detroit, took action in favor of the bridge scheme. The proposed structure will start from the foot of Second Street, and will have a total length of 2650 feet, with a height of 15 feet in the clear from the surface of the river. It will have twelve spans: the first 100 feet, the second 375 feet, then seven spans of 200 feet each, another of 375 feet, and

the two nearest the Canadian shore 200 feet each. Four draws are contemplated, large enough to insure no obstruction to navigation.

The new tunnel of the Delaware, Lackawanna, and Western Railroad through Bergen Hill is making headway. On the eastern end the heading has been advanced some fifteen feet. Shaft No. 1 has been sunk seventy-one feet, just to the roof of the tunnel. Shaft No. 2 has been sunk about fifty feet, No. 3 about forty feet, and Nos. 5 and 6 down to the rock, which is here about fifteen feet under the surface. At the west end the rock has been stripped of its covering of earth, and the heading has been commenced. A beginning has also been made on the heavy cutting west of the tunnel. A full force of men is now engaged upon the work.

A project of considerable importance was recently brought before the Legislature of New York, namely, a scheme for the construction of a navigable water-way between Troy and Lake Champlain. The work includes the deepening of the Hudson River from Troy to Fort Edward, and the excavation of a canal from the latter point to Whitehall, on the lake. The proposed improvements will extend over sixty-three and three-tenths miles. Its object is to increase the facilities of New York to command the commerce of the West. The maximum cost of the projected canal is estimated at \$10,000,000, and if carried into effect, it will secure water communication from the Missouri and Mississippi rivers, and from all the ports of the great lakes, to tide-water at the cities of Troy, Albany, and New York for vessels of 2000 tons burden.

A project of similar intent, the James River and Kanawha Canal, to connect the James and Ohio rivers, and which claims to possess extraordinary advantages as a measure of relief to the Western population in providing a great highway for the cheap transportation of their bulky productions to market, and for fostering commerce in general, has lately been made the subject of a favorable report by Chief Engineer General A. A. Humphreys, U.S.A. The cost of this enterprise is estimated to fall within \$60,000,000, and the time necessary for its completion six years.

The Channel tunnel to connect England and France is still talked about. A meeting of French and English railway directors has been held, and, it is said, they have determined what ought to be done. A commission of French inspectors of navigation and ports, in pursuance of their duty of considering questions relating to the improvement of the means of communication between England and France, have been examining a scheme for a new port to the southwest of Boulogne.

A novelty in rapid local transit is about to be tried in the interests of the residents of the neighborhood of Philadelphia. The proposition is to construct an inclined-plane steam passenger railway from Manayunk to Roxborough. From abroad we may record a similar proposal to construct a railway from Naples to the crater of Mount Vesuvius.

A railroad scheme of vast possible importance—namely, the Indo-European Railway—is now receiving considerable attention from the governments most interested. The proposition at present mooted is that of M. Ferdinand de

Lesseps, of Suez Canal renown, and its object is to unite the south and west of Europe with the richest portions of Central Asia, and further on in the future with the far eastern parts of that continent. The Russian and East Indian press are according the project most favorable consideration as a means of developing the enormous and varied resources of the East.

In the direction of railway improvement, it is interesting to record the favor with which several successful American inventions have been received abroad. The Pullman system of palace cars, so largely in use upon the railways of this country, has within a few months past been introduced experimentally upon the English roads, and has met with a quite enthusiastic reception. The Westinghouse air brake likewise is being quite largely adopted, since several recent trials with the apparatus developed its remarkable utility.

The approach of the season of industrial exhibitions has already been brought to public notice. The programmes of several such undertakings have already been published, and ere the month has passed these will doubtless be augmented by others. The American Institute of New York announces the opening of its forty-third annual exhibition on the 9th of September next. The Franklin Institute has likewise decided to revive its old custom, by holding an exhibition of arts and manufactures in the city of Philadelphia, in commemoration of the fiftieth year of its foundation, from the 6th to the 31st of October, 1874. In its published invitation to the public to participate the committee having the enterprise in charge states its desire to make this exhibition represent as fully as possible the mechanical improvements of the last half century, to which the Institute has so largely contributed.

In connection with the subject of exhibitions we must note the novel but eminently useful proposition of the British Social Science Association to hold a sanitary and educational exhibition at Glasgow during the coming fall. The object of this exhibition is to bring under the notice of the public generally, and particularly of that portion interested in social, sanitary, and educational questions, the latest scientific appliances for improving the public health and promoting education. Of these, all matters pertaining to architectural and sanitary engineering, ventilation, heating and cooking, water supply, sewage and drainage, food, disinfectants, hygienic appliances, articles used in teaching, and every thing appertaining to the advancement of public health and comfort and the promotion of education, may be named.

Report No. 6 of the Bureau of Statistics, now in press, gives the following compilation of the imports and exports of the United States for the years 1872 and 1873, up to December 31, viz.: Imports, 1872, \$677,144,579; imports, 1873, \$624,997,362, showing a gain for the country of fifty-two millions. Domestic exports, 1872, \$544,438,789; ditto, 1873 (specie values), \$606,366,531, showing a gain of sixty-two millions for the country. In 1872 our specie and bullion imports were \$21,182,004; in 1873, \$29,749,439. In 1872 our specie and bullion domestic exports were \$92,295,236; in 1873, \$56,268,496. Our export of domestic manufac-

tures was increased in one year ninety-eight millions.

In connection with this subject it may be of interest to add that the exports of railroad iron from Great Britain for the months of January and February, 1874, amounted to 96,311 tons, against 91,551 tons during the same period of 1873. Of these amounts the United States took 48,901 tons, or more than one-half, in 1873, and 16,978 tons, or about one-sixth, in 1874.

The announcement is made that the cables of the Western Brazilian Telegraph Company, from Pernambuco to Rio Janeiro, have been successfully laid, and have answered all the tests for the stipulated period after submersion. The section from Para to Pernambuco having been previously certified, telegraphic communication between the portions of the South American coast above named is now effected.

The consumption of copper in the United States during 1873 amounted to 33,000,000 pounds, of which 28,000,000 pounds were of home production. In many branches of manufacture it appears that copper is steadily superseding iron. The manufacture of phosphor-bronze in this country, it is stated, is in future to be in Philadelphia, the American Company being now engaged in effecting the transfer of their establishment from Pittsburg. Large quantities of the new alloy are now being made for railway companies and others for special uses.

Of *Mechanical* novelties for the month we may name the invention of an ingenious machine by Mr. Miner for paper hanging. Without going into the details of its construction, it is enough to say that when at work the machine is raised to near the ceiling by means of a handle and pressed against the wall. The paper releases itself from certain hooks, and as the machine is brought down a roller presses the paper to the wall. The machine is used for papering overhead and putting on bordering in a similar manner. By this invention the tedious operations of unrolling, cutting up the paper, and spreading the paste are obviated, the result being a great saving of time.

The Wilde electric light has lately been tried upon one of the British gun-boats with very satisfactory results. A recent trial showed its power to be immense, and that no boat could approach within a mile of it without being discovered.

The English Admiralty are at present having a powerful iron-clad war vessel constructed. She is to be of novel pattern, her gun power will be enormous, and her armament a wonder. When completed she will be the most powerful ship in the world. To offset this, it is reported that orders have been sent to Woolwich for a couple of eighty-ton guns, which when finished are expected to be able to send a shell through twenty inches of solid iron at 1000 yards.

As *Miscellaneous* matter, and not coming under any of the heads that we have severally mentioned, we may refer again to the intended celebration of the thousandth anniversary of the discovery and settlement of Iceland in August next, which promises to be made the occasion of specially interesting ceremonies. Many scientific and literary institutions in America and Europe are preparing contributions of books and other articles for presentation at that time, and

it is not unlikely that the three principal libraries of the island will be greatly enriched by these contributions. Dr. I. I. Hayes has announced his intention of visiting the island during the coming summer, and will probably take part in the ceremonies. He offers to be the almoner of any contributions that may be made of the kind referred to.

Mr. Alexander Agassiz, who succeeds his father in the direction of the Anderson School of Natural History on Penikese, announces that it will open on the 7th of July, and close on the 29th of August. A corps of eminent specialists has been announced as to take part in the instruction to be given, and the school, it is hoped, will be a still greater success than in the past year. Efforts are being made to secure an en-

dowment for this praiseworthy establishment, and it is stated that the sum of \$5000 paid in, or an annual contribution of \$350, on the part of any State or institution, will secure the admission of two students, free of charge for tuition, and liable only to expense for rooms and board.

Of deaths since our last enumeration the list is quite large. Among them are Sir Francis Pettit Smith, Mr. Philip Baines, Dr. Neil Arnott, Dr. Forbes Winslow, and Albert Way, of England; Dr. Karl E. Bock, Baron v. Penzlin, and Dr. J. H. Mädler, of Germany; Dr. M. von Jacobi, of Russia; Professor Guillemin, Professor Cruveilhier, and L. F. Meunier, of France; and Mr. Joseph Harrison, Jun., of Philadelphia—all of these well known in some branch of science, theoretical or applied.

Editor's Historical Record.

OUR Record is closed on the 21st of May.—

On the 28th of April a vote was taken in the Senate on the passage of the Finance Bill notwithstanding the President's veto. There were 34 votes for its passage to 30 against. May 6 Senator Sherman reported a substitute for the House Currency Bill. It provided for free banking, the release of the reserves on circulation, except five per cent., which is to be deposited in the Treasury, and required reserves on deposits to be kept by each bank in its own vaults. To prepare for specie payments, the bill required the retirement of greenbacks equal in amount to fifty per cent. of the new national bank currency issued. This substitute contemplated also the redemption of the greenbacks after January 1, 1877, whenever presented in sums of \$1000 or any multiple thereof in gold or five per cent. gold bonds, at the option of the government, the greenbacks thus redeemed to be used by the Secretary of the Treasury as any others in the Treasury. This bill was passed by the Senate May 14.

A bill was passed by the House, April 28, appropriating \$90,000 for the purchase of rations to be distributed among the sufferers from the inundations of the Lower Mississippi. The Senate passed the bill May 1. Another section was added, May 7, appropriating an additional sum of \$100,000.

Senator Windom, on the 24th of April, presented the report of the select committee on transportation. The investigation of the committee covered a system of transportation embracing 70,000 miles of railway and 30,000 miles of water routes. Senator Windom's conclusions may be briefly summarized as follows:

1. That there should be a Bureau of Commerce formed in one of the executive departments, whose duty shall be to collect full and detailed information on the subject of our internal commerce.

2. The only method for obtaining facilities in every way ample for transportation is through competition, under governmental control.

3. Cheap means of transport can only be provided through double-track freight railways or by the improvement and creation of water routes.

The Senate amendments to the Louisville and

Vol. XLIX.—No. 290.—20

Portland Canal Bill were concurred in by the House April 30.

The Geneva Award Bill was passed by the Senate May 12. It organizes a court to adjudicate claims; but the claims of insurance companies are excluded.

On May 19 the House passed a bill repealing the system of moiety payments to informers in customs revenue cases.

The bill appropriating \$3,000,000 to the Centennial Commission was defeated in the House May 7—yeas 92, nays 138. The question was as to passing the bill to a third reading.

The bill for the protection of life and property on steam-vessels, a measure comprising a complete code of regulations for the governance of river, lake, and ocean steamers, was passed by the House May 13. Among its provisions is one abolishing compulsory pilotage for coasting vessels.

The military court in the Howard inquiry, presided over by General Sherman, on the 9th of May recorded its conclusion that General O. O. Howard had conducted the affairs of the Freedmen's Bureau with ability and fidelity, and that he was not properly chargeable with any of the offenses imputed to him.

The conflict between the rival Governors of Arkansas, after being waged over a month, accompanied by riotous disturbance and much bloodshed, was terminated May 19, by the retreat of Brooks's forces and the occupation of the State-house by Governor Baxter.

W. W. Eaton has been elected by the Connecticut Legislature to the United States Senate.

The New York Legislature has passed the Compulsory Education Bill, which has been signed by Governor Dix. It compels parents and guardians of children between the ages of eight and fifteen years to give them in a school or at home at least fourteen weeks regular instruction every year in reading, writing, arithmetic, English grammar, and geography. It prohibits the employment of children within the ages named at any labor during the time when the district schools are opened, and school officers are given authority to see that it is enforced.

Negotiations have been in progress for some months with a view to a new treaty of commer-

cial reciprocity with the Dominion of Canada. Under the Washington Treaty the enjoyment of the shore fisheries of the St. Lawrence was leased to the United States for twelve years, on condition that their cash value during that term should be determined by arbitrators, and the amount paid over to Canada. A few months ago Mr. Rothery, an eminent English juriconsult, was sent out by the British government to make the necessary arrangements for giving effect to this arbitration, and he was busy getting up facts and evidence, when the Canadian government suggested how much more reasonable and profitable to both countries it would be were the war of their fisheries merged, as formerly, in a treaty of commercial reciprocity. Communications between our government and that of Great Britain on this suggestion resulted in the present effort to ascertain if the substitution can be made on terms satisfactory to both parties. Mr. Fish, Secretary of State, conducts the negotiations on behalf of our government; and Sir Edward Thornton, British minister here, and the Hon. George Brown, Senator of the Canadian Dominion, act as joint plenipotentiaries on the part of Great Britain. It seems clear from a review of commercial statistics that the United States has suffered more than Canada from the repeal of the old reciprocity treaty in 1866. Since that date the foreign commerce of the Canadians has nearly doubled; but the proportion of this commerce transacted with the United States has fallen away until it is now only thirty-five per cent. of their trade. Before the repeal the balance of trade was largely in our favor; since the repeal it has been against us.

The French National Assembly met at Versailles May 12. M. Buffet was re-elected President. On the 15th the Duc de Broglie introduced his project of a law for the creation of a second chamber, to be known as "The Grand Council." It was, amidst great excitement, referred to the Committee of Thirty. The next day the government sustained a defeat. The Duc de Broglie insisted upon the priority of the discussion of the Electoral Law over the Municipal Bill, and made it a cabinet question. The vote stood 317 in favor of the government to 381 against. The ministry then resigned. M. Goulard was intrusted with the formation of a new cabinet.

Marshal Serrano took possession of Bilbao May 2. During the last week of the Carlist siege the inhabitants of the city were without bread. Marshal Serrano was received in Madrid, May 6, with a triumphal ovation. Among those tendering their congratulations was Señor Castelar. On the 13th a new ministry was announced, constituted as follows: Zabala, *President of the Council and Minister of War*; Sagasta, *Minister of the Interior*; Ulloa, *Minister of Foreign Affairs*; Camacho, *Minister of Finance*; Alonzo Martinez, *Minister of Justice*; Alonzo Coimenes, *Minister of Public Works*; Romero Ortiz, *Minister of the Colonies*; Rodriguez Arias, *Minister of the Marine*.

The Russian Czar and the Grand Duke Alexis were received at Windsor Castle, in England, May 18.—An exhibition of textile plants, and machines employed in their cultivation, is to be held at St. Petersburg June 13, 1874.

Early in April the representatives of 746 co-

operative associations in England and Wales, having 300,587 members, held a congress at Halifax. The share capital of these co-operative associations is £2,784,000. During the year the sum of £10,176,000 was paid, and £11,379,000 was received for goods, the net profit amounting to £807,748.

During the first week in May there was a strike among the miners in the Durham collieries, in England. It is estimated that 50,000 men were out of employment thereby. The number has since increased to 70,000.

The steamer *Caspian*, from Liverpool for Portland, May 6, took out 350 agricultural laborers for the United States and Canada.

The estimates of the Indian budget for the extraordinary expenses of the government for 1874-75, on account of the famine, amount to \$32,500,000.

DISASTERS.

May 2.—At Shawangunk, thirty miles from Kingston, New York, the steam-boiler of Condit's paper-mill exploded, nearly demolishing the building, and killing seven of the employés.

May 16.—The Mill River reservoir, covering a tract of 100 acres, at Williamsburg, Massachusetts, gave way early in the forenoon, precipitating the vast mass of water it contained down a steep and narrow valley into the village of Williamsburg, and thence, further down the valley, through the villages of Haydenville, Leeds, and Florence, into the Northampton meadows. Manufacturing establishments and dwellings, representing over a million dollars' worth of property, were swept away, and about one hundred and fifty people were drowned.

May 18.—Fire in Galata, a suburb of Constantinople, Turkey. One hundred houses burned, occupied mostly by poor Jews.

OBITUARY.

April 23.—In Baltimore, the Rev. Henry Slicer, D.D., an eminent Methodist divine, aged seventy-three years.

May 3.—In New York city, General William Hall, a veteran of the war of 1812, aged seventy-eight years.—In Burlington, New Jersey, Edward Morris, author of *Ten Acres Enough*.

May 4.—In Whitesborough, New York, Beriah Green, one of the pioneers of the antislavery movement, aged eighty years.

May 7.—In New York city, John Hecker, flour dealer and philanthropist, aged sixty-two years.

May 16.—In New York city, Major-General George L. Hartsuff, aged forty-four years.

May 18.—In New York city, the Rev. Dr. Thomas De Witt, an eminent clergyman of the Dutch Reformed Church, aged eighty-three years.

May 20.—In Washington, Major-General A. B. Dyer, Chief of the Ordnance Department.

May 9.—The London *Athenæum* announced the death of Mr. Mowbray Morris, in his fifty-fifth year. Mr. Morris became connected with the London *Times* as a contributor in 1847, and soon afterward became the manager of that journal.

May 16.—Death announced of Baron Henri de Triqueti, a celebrated French historical painter, aged seventy-two years.—In France, Gabriel Charles Glayre, painter, aged sixty-seven years.

Editor's Drawer.

A FEW years ago, when General N—— was making an active political canvass in the Territory of ——, then on the eve of its admission into the Union as a State (he was then Territorial Governor), he was confronted by an opposition which had small respect for the amenities of debate or the conventionalities observed in more cultivated communities. At Sandy Gulch, where a meeting was to be held, there appeared in the crowd opposed to him a rough, pestilent, desperate fellow named M'Guire, puffy with pistols and things, who was bent upon trouble, and meant, if possible, to break up the proceedings. In General N——'s following was a "gentleman" named Taylor, equally ready for similar work, and thoroughly devoted to his chief. At the opening of the meeting it became evident that M'Guire had inserted into his noble form just enough whisky to be reckless. He was thoroughly inflated. As things went on he became more and more offensive, until the general's friend came up, and whispered in his ear,

"General, hadn't I better kill him?"

"Oh no," replied the general, "that wouldn't do. I couldn't sanction any violence, much less a murder; *but*, if any little thing *should* happen" (here he lowered his voice, and spoke jocosely, as he meant it)—"if any little thing *should* happen, I've got my pocket full of blank pardons."

A few minutes later M'Guire broke out into a fresh tirade, whereupon Taylor drew his revolver and shot him through the brain. He fell like a log. Walking up to the body, and standing astride of it, revolver still in hand, he looked coolly upon the excited crowd, and said,

"Gentlemen, I trust that *now* we shall have order in this meeting!"

Order was had. The general concluded his remarks, the meeting quietly adjourned, M'Guire's body was slung over a mule, and taken away by his friends, who buried him "with his boots on," and that was the end of it. There was some talk for a day or two; nothing more. It was one of those little incidents, you know, that will occur in frontier life.

ONE of the brightest of our lady writers has a neat hit at the ostentatious economies advocated by some of our great and good men at Washington. She says that "there is on the Ohio River, near Pittsburg, a prosperous town named Economy, occupied by a German community called 'Economites.' They neither marry nor are given in marriage, yet are not religious zealots or ascetics. They have hard hands, hard faces, drive hard bargains, and believe in hard money. The member who saves, shaves, and skimps most is the best fellow and the chief saint;" and these she compares to the Congressional "Economites" who arrest important public enterprises, and discharge faithful old public servants. There is no work so fitting and necessary that they will not dispute the cost, even after it is done by their own act, and can not be undone. They remind one of that well-to-do but penurious Irish widow who had, on being apprised of the death of her husband in a distant city, telegraphed, in the first flush of her grief and good feeling, to have

the mortal remains of the dear departed embalmed and sent home. She bore up well till the undertaker's bill came to hand. Then her countenance fell; and when she reached the charge for embalming, she indignantly exclaimed, "Sivinty-five dollars for stoofin' Dan!"

THE late Mr. Gulian C. Verplanck's appreciation of the ludicrous was one of the noticeable traits of his character, and his manner of putting things was exceedingly quaint and delightful. The following pleasantry, now for the first time in print, was told to the Drawer a few evenings since at a gathering of bright people. Those who never met Mr. Verplanck may be told that in figure he was rather short and corpulent. Walking down town one July morning, he thought he would purchase a light linen coat, and for that purpose entered the first clothing store he reached. To the salesman he said,

"I want a light summer coat."

"Yes, Sir," replied that person, who approached, and after a rapid glance up one side and down the other of the venerable gentleman's figure, called a boy, and pointing to a brown sack hanging on a certain peg, said, "Just bring that—number five—*fat*."

Mr. Verplanck used to say that he had never before known with exactitude his physical number and contour, but that "number five—*fat*" defined it with precision.

THE Rev. James Gallaher, who preceded the Rev. William H. Milburn as chaplain of the House of Representatives, commenced his ministry in Tennessee. He was one of the editors of the old *Calvinistic Magazine*, and a strong champion of the Presbyterian faith, a man full of humor, with great tact in avoiding controversy when wisdom so directed.

In one of his horseback rounds a good Arminian family entertained him very kindly, and as he was mounting his horse to leave, his host said to him, "Now, Mr. Gallaher, tell me what you honestly think about falling from grace."

"I suppose you want to know my real candid opinion?" said the minister.

"Yes, that is what I am after."

"Well, then," continued Mr. Gallaher, "I will tell you in a few words—I'd hate mightily to try it."

THE playful humor of the very Western man is illustrated in the following little incidents sent to the Drawer by a gentleman connected with one of our leading benevolent societies:

A missionary of the American Sunday-school Union in Missouri visited recently a place where a certain church-militant preacher was in the habit of holding forth once a month, and certain young men were in the habit of disturbing the meeting. Being a rough man, he so roughly reprimanded them that they threatened to thrash him the next time he should come. He heard of this, but came at the regular time, and after preaching said,

"I have heard of your threats. Now, if any of you think I won't fight because I'm a preacher, just try me—just come on" (striking his fists

together). "I will fight any man of you, or any two men, fists or skulls, pistols or knives. There are as many pistols for me as for any of you. If you don't like my preaching, I can whip you: just come."

The missionary planted a Sunday-school there, and was not molested by the young men.

At another place, where he organized a school, one man said, "I will go in for it if you don't put on *too much style*. I don't like town style. I was in a big town once where every man had on a stove-pipe hat, and I spoke to every body I met on the street, but they were too proud to speak to me."

During this trip the missionary organized five Sunday-schools.

"ADVICE"

UNDER this caption Mrs. Allen gave in our March issue some excellent verses, but one of our readers doesn't agree with her, and this is what he says about it:

Miss Elizabeth Akers Allen,
Or Mrs.—whichever it be—
You've mistaken a segregate case
For a broad gen-er-al-tee;
Or else you've a bad digestion,
Or a cast in your weather ee,
Or experience specially bitter,
Direct the reverse from me.

For I wooed me a dear little woman—
Twenty-one years have sped their flight,
Yet I kissed her good-by this morning,
And we'll meet with a kiss to-night;
Though my chin is as gray as a badger,
And spectacles rim her sight,
Yet the love which was bright at the outset
Is to-day not a whit less bright.

Ah! you read me your own sad riddle,
When your "globule of molten gold"
In the fond hand once imprisoned
Grows colorless, dull, and cold!
Why grows it thus lifeless and frigid,
If the glory (?) in which it rolled
But a moment ago was *real*—
If its flashes a verity told?

And why do you call a man fickle,
If an *insect*, all sharded and brown,
He finds in the hand he *imagined*
Was grasping an emperor's crown?

Yet your counsel is fitting—*provided*
The maiden is conscious that she
Is a climber instead of a jewel,
A beetle instead of a bee.
But if with her wealth of affection,
As deep and as wide as the sea,
She has patience, good-will, and discretion,
With a measure of charity,
She can make the most obdurate human
What a dear little woman made me,
And have—if it's worth the endeavor—
A lover at fifty-three.

It is seldom that the Drawer has the pleasure of placing among its anecdotes a pleasantry by the President. A few weeks since some ladies, friends of the wife of General Woodford, M.C. from Brooklyn, called at the White House, but were refused admission by the watchman. General Woodford came along, and under his escort they visited the mansion, and were accorded a special presentation to the President. In the interview the ladies spoke of the large portrait of the President in one of the rooms on the first floor. The President remarked that he didn't know where he should find a house big enough to hold it when they should leave this.

"But," said Mrs. Woodford, "you will be

elected for a third term, and this house will hold the picture four years longer."

"No," replied the President, "I shall veto that. *It would be inflating my term of office, and I will always veto inflation.*"

SPEAKING of the President, a correspondent at Syracuse sends this:

During the siege of Vicksburg one day General Grant's men blew up a rebel fort, and a colored man was blown over to the Union side, falling safely into the soft mud. As he was the last arrival from Vicksburg, every one was anxious to see him and hear his story. General Grant had him brought before him, and among other questions asked him how high he went up at the time of the explosion. The negro replied, "I can't say for sure, but tink 'bout *tree miles*!"

A MISSIONARY of the American Sunday-school Union in Arkansas illustrates the character of a section of his field thus:

At C—, the county seat, two young men had some words about a young lady, and one shot the other dead in the street. At the primary trial the justice of the peace, the State's attorney, and the accused all appeared in the court-room pistol in belt.

Not long after he established a Sunday-school there, and preaching and improvement followed.

Imagine Recorder Hackett, District Attorney Phelps, and one of our murderers coming into court, carrying a small arsenal with them!—though the criminal wouldn't stand much of a chance against the judge, who makes nothing of shooting a humming-bird at half a mile.

THIS from Christian County, Kentucky:

Some time ago a party of seven or eight left this county for a big fish and hunt on Tennessee River. Among them was Colonel Matt M'Kinney, formerly a member of the Legislature, and extensively known in the State as a genial companion. He was a lover of "seven up," and, for want of better amusement, the first night proposed his favorite game. No one in the party volunteered to play save Pete, the old negro cook, with whom, as a last resort, the colonel consented to play. The rest of the party went to bed, and left them at it on a log. About twelve o'clock one of the party, Major Mallory, happened to rouse up, and heard the colonel say,

"Pete, you had that jack; what did you do with it?"

"Clar for goodness, Mass Matt, I hain't got it."

"Yes, you have," replied M'Kinney. "Take off your clothes; I know you have it. Off with that coat! roll up them sleeves!"

Pete did so, but no jack. The colonel then took up the "deck" to see if all four were there.

"Clar for goodness, Mass Matt, if dat jack ain't in de 'deck,' it's loss out."

It was not there. Next morning, Mallory and old Pete being alone down the river, the former asked him where the jack was.

"Well, boss," says Pete, "you see, from de way Mass Matt was leadin', I knowed he was gwine ketch it, so I swallowed it!"

At camp that night the joke was told by Mallory, and was followed by a big laugh. M'Kin-

ney, musing with elbows on knees before the fire, remarked, with a vigorous but improper adjective,

"I knowed he had it about him *somewhere*!"

THE familiarity of the frontiers-man with scenes of shooting and executions by Lynch-law, and his coolness in the average Western affray, are proverbial. The last instance that has come to our knowledge in which enterprise and self-possession were admirably mingled occurred at the recent execution of a criminal in Washington Territory. Just as he was about to be swung off, and after he had remarked to the sheriff that he had nothing further to say, a real-estate agent, whose office was in his hat, forced himself to the front and up the steps of the scaffold, and jointly addressing the criminal and the sheriff, said, "*If the gentleman who occupies the platform will kindly yield for a few minutes, I would like to make a few remarks upon the cheap homestead lots at Dobson's Hole I am now offering for sale.*" The polite request was assented to, and after a brief summary of the advantages presented by that locality the sheriff resumed his duties, pulled the cap over the "gentleman's" countenance, and permitted him to drop.

WE think it is safe to say that the country may be regarded as sound on the cremation question. The subject agitated the nation through and through, but it has finally simmered down, and equanimity with her pleasing smile now beams upon us. A few traces of the upheaval remain scattered here and there, in the form of editorials and poetry, destined to speedy cremation unless embalmed. We have therefore deemed it expedient to clutch from oblivion the following rhythmic gems, which show how easily we were becoming habituated to the notion of burning:

On Tuesday morning Silas Green,
Aged forty-seven, died.
Male friends, please call to-morrow noon
And see the torch applied.

We lit the poor fellow at dead of night,
The carcass continually turning,
In order that each side might get its share
Of this new patent process of burning.

No pelting rain-storm came wetting the pile
Of fagots to which we had bound him,
Nor Babcock Extinguisher deadened the glare
That formed such a halo around him.

Few and short were the prayers we said,
And we spoke not a word of sorrow,
But merely remarked, "*Don't he sizzle! he'll be
But a handful of ashes to-morrow.*"

Widow Spivens has just passed away from our midst,
And her last words—so touching—were these:
"Just whirl me aloft in a turpentine cloud:
No mud-hole for me, if you please!"

THE Galena editor who published that funny thing about the Sunday-school superintendent's remark to his scholars about the steamer did not remember how good the original was, written by Mark Twain, and published three years ago in London. It is as follows:

MISPLACED CONFIDENCE.—"Just about the close of that long, hard winter," said the Sunday-school superintendent, "as I was wending toward my duties one brilliant Sabbath morning, I glanced down toward the levee, and there lay the *City of Hartford* steamer! No mistake

about it: there she was, puffing and panting after her long pilgrimage through the ice. A glad sight? Well, I should say so! And then came a pang right away, because I should have to instruct empty benches, sure: the youngsters would all be off welcoming the first steamboat of the season. You can imagine how surprised I was when I opened the door and saw half the benches full! My gratitude was free, large, and sincere. I resolved that they should not find me unappreciative. I said, 'Boys, you can not think how proud it makes me to see you here, nor what renewed assurance it gives me of your affection. I confess that I said to myself, as I came along and saw that the *City of Hartford* was in—' 'No! but is she, though?' And, as quick as any flash of lightning, I stood in the presence of empty benches! I had brought them the news myself."

A GENTLEMAN, recently from abroad, and a lover of church music, inquired of the clerk of the Fifth Avenue Hotel, on his first Sunday morning, where he could hear the best church music. He was recommended to — Church, where the fugues and things were of the highest. Thither he went, and was shown into a pew in which a lady sat. At the commencement of the first chant, madame, with the usual politeness of American ladies, handed the stranger the prayer-book, pointing to the chant. It was politely received, but soon closed. At the second chant madame repeated the offer, when, turning to her with a polite bow, the gentleman said, "Thank you, but I seldom use the libretto."

IN a recent English magazine we find an article on "Men and Manners in Parliament," in which the manners of Mr. Disraeli, Mr. Gladstone, and Mr. Bright are described, and a few *bonnots* of the latter given. "Mr. Disraeli's manner in the House of Commons is one strongly marked, and is, doubtless undesignedly, calculated to increase the personal interest which has for more than a generation been taken in him by the public. Either because his colleagues do not care to chat with him, or because he discourages private conversations in the House, Mr. Disraeli always sits apart in a sort of grim loneliness. Mr. Gladstone is, except when he sleeps, rarely quiet for a moment, frequently engaging in conversation with those near him, often laughing heartily himself, and being the cause of laughter in his interlocutors. When Mr. Disraeli enters the House and takes his accustomed seat he crosses one leg over the other, folds his arms, hangs down his head, and so sits for hours at a time in statuesque silence. When he rises to speak he generally rests his hand for a moment upon the table, but it is only for a moment, for he invariably endeavors to gain the ear of his audience by making a point at the outset, and the attitude which he finds most conducive to the happy delivery of points is to stand balancing himself upon his feet, with his hands in his coat-tail pockets. In this position, with his head hung down as if he were mentally debating how best to express a thought that has just occurred to his mind, Mr. Disraeli slowly utters the polished and poisoned sentences over which he has spent laborious hours in the closet. Mr. Bright is a great phrase-maker, and comes down to the House with the gems ready

cut and polished to fit in in the setting of a speech. But no one could guess from Mr. Bright's manner that the phrases he drops in as he goes along are fairly written out on a slip of paper carried in his waistcoat pocket as he crossed the bar of the House.....His manner when speaking is quiet and subdued, but it is the apparent subjugation which a bar of iron undergoes when it passes from the red-hot stage to the condition of white heat. When he sits down there is invariably a feeling among his audience that he has by no means exhausted himself, but could, if he pleased, have said a great deal more that would have been equally effectual. To this end his quiet, self-possessed manner greatly tends. He has himself well in hand throughout his orations, and therefore maintains his hold upon his audience. Mr. Bright is also a great humorist. When, recently, he had occasion to complain of the determined dissatisfaction of the Conservatives, he turned to the classical book of the people, and on the morrow all England was laughing at the party who, 'if they had been in the wilderness, would have complained of the Ten Commandments as a harassing piece of legislation.' Again, when he dubbed Mr. Disraeli 'the mystery man of the ministry,' and when he likened Mr. Lowe and Mr. Horsman to a Scotch terrier, 'of which no one could with certainty say which was the head and which the tail,' every body could comprehend and enjoy the reference. The fearful sting contained in his casual remark about Sir Charles Adderley in a letter written two months ago—'I hope he thought he was speaking the truth, but he is rather a dull man, and is liable to make blunders'—will be best appreciated by those who know the right honorable baronet. But the volume of sarcasm hidden in the parenthetical remark about the gentleman's ancestors who came over with the Conqueror—'I never heard that they did any thing else'—is plain reading for all. So is the well-merited retort upon a noble lord who, during a time when Mr. Bright was temporarily laid aside by illness, took the opportunity to publicly declare that, by way of punishment for the uses he had made of his talents, Providence had inflicted upon Mr. Bright a disease of the brain. 'It may be so,' said Mr. Bright to the House of Commons when he came back; 'but, in any case, it will be some consolation to the friends and family of the noble lord to know that the disease is one which *even Providence* could not inflict upon him.'

THIS from Peekskill:

Two young girls of the sewing fraternity, or sisterhood, were stitching away for dear life, when one broke the dreary silence by wishing they were dead. "Be still, and work hard," said the other; "*business before pleasure*, you know."

LITTLE Mabel B——, a Baltimore miss of five summers, is blessed with a very retentive memory and remarkably acute powers of observation, and there is little she sees or hears that escapes her. Her grandmother has recently been reading portions of the New Testament to her: the parables especially seemed to arrest her attention, and her application of them to every-day occurrences is often singularly amusing. Her mother, on going into the dining-room a few

weeks since about dinner-time, overheard Miss Mabel talking in a very earnest and peremptory manner to the servants in the kitchen. So when she came out she was asked what she had been saying to the girls.

"Why, mamma," said she, "I was only telling those *wicked and slothful servants* to hurry up dinner."

ANOTHER from the same source, almost as good:

A very intimate friend of her mother was recently unfortunate enough to catch the measles—a circumstance that suspended intercourse between the two for a week or more, Mrs. B—— naturally fearing that she might carry the contagion home to her little daughter. This temporary interruption of their intimacy seemed to concern Mabel not a little, and one day, after vainly urging upon her mother the importance of visiting Aunt Amno, as she calls her, she said,

"Mamma, Aunt Amno has been *sick and in prison* for a week, and *ye visited her not*."

It is no reproach to the memory of James Buchanan to state that in very early life his political sentiments inclined toward the Federal party, nor does it detract from his reputation to allude to the fact that on that account the old-fashioned dyed-in-the-wool Pennsylvania Democrats of the Jeffersonian school were for a time rather reluctant to accept him as a leader. We only refer to these reminiscences now to explain the *point* in the anecdote we are about to relate, for the truth of which we stand ready to vouch, albeit it may not be among the "Recollections of an Old Stager."

When Mr. Buchanan became Secretary of State in the cabinet of President Polk he appointed to a clerkship in his department a young lawyer from Reading, Pennsylvania (since deceased), who may be said to have imbibed Democracy with his mother's milk, so thoroughly impregnated was he with the pure creed of that political party—a creed that then was, as now, the only orthodox faith in the territory of "Old Berks." One of the clerical duties to which this zealous disciple of Jefferson was assigned was the transcribing and arranging for publication of the "Jefferson papers," for which the bias that early association and training had given to a mind naturally predisposed to the study of questions of partisan politics peculiarly fitted him. This young gentleman, habitually reserved and taciturn in his manner, was subject to occasional "queer" spells, whether the result of overstudy or of some hereditary taint of blood the writer hereof is not able to say. These attacks were nothing more than transient hallucinations, leading their subject to do and say ludicrous things. When one of them came on it was only necessary for his friends to persuade him to keep his room for a few days, and submit to some simple dietary treatment, to "bring him around" again.

Well, it so happened that one day, in the midst of his researches among the musty archives of state, the "queer" fit came upon him, and—which was *not* queer under the circumstances—took the shape of fierce invective against ancient Federalism and its whilom adherents. He was taken quietly to his lodgings, and the physician, who was familiar with the case, and knew per-

fectly well how to indulge the humor of his patient, was sent for. A day or two afterward Mr. Buchanan heard of the indisposition of his Pennsylvania protégé, but not of its nature; and as the acquaintance between them was both personal and neighborly, as well as official, the Secretary, at the close of office hours, went to make a call upon his invalid clerk, and see that he was "well bestowed." A servant conducted him to the room where he lay, when imagine the astonishment of the grave and dignified cabinet minister, almost instantly upon his entrance, to behold his hitherto shy and reticent young friend bolt angrily from his bed, glare at him with eyes flashing defiance, and, with clinched fists menacingly extended, exclaim,

"You — old Federalist, what do YOU want here?"

Mr. Buchanan, it may be imagined, quickly withdrew, without stopping to make his kindly intended inquiries into the condition of his sick and, as it must then doubtless have struck him, unprovokedly insolent subordinate. The cause, however, of this singularly rude reception was soon explained to him, and his sense of the ludicrous was keen enough to enable him to enjoy the farcical *rencontre* after the shock inflicted by its abruptness had subsided; and although not given to Mr. Lincoln's habit of repeating pungent jokes, particularly when the subject was one upon which he always manifested an undue degree of sensitiveness, he could not resist the temptation to relate it to an intimate friend, who was well acquainted with the unconscious and irresponsible author. And that's the way we came by the story.

In one of those little cities which abut upon Boston a parish meeting was recently held, at which objection was made by Mr. Garrett that the style of the music in the church was too operatic; whereupon one of the members made the point that it was quite inconsistent for Mr. Garrett to object to upper-attic singing. That was thought rather good—in the town that abutted upon Boston.

A CORRESPONDENT at Duncan's Mill, Sonora County, California, writes:

The following rather tough bear story was told in my hearing by an old settler in Russian River Valley. I give it as I got it. If you deem it worthy a corner in the Drawer, you can just throw it in.

"You talk about bears! Why, when I first came to Rooshan River bears was plentier than cattle is now, and they was a little bit the smartest bears that I or any body else ever seed. Why, do you know, there was a neighbor of mine had a fine field of corn, and he also had a fine lot of hogs. In the fall, when the corn began to get ripe, the bears would come into the field and make awful work among the corn; they were jest literly cleanin' it out, and the hogs was a disappearin' too, and the old fellow couldn't find where the bears had killed any of the hogs, and he was clean beat out. At last, when all of his hogs and a good deal of his corn had disappeared, he thought it was about time to investigate. So he started out. After hunting around for some time he found a trail leading off from the corn field in the direction of a patch of timber

about three miles away. He followed the trail, and when he got to the timber he discovered his hogs nicely inclosed in a pen [corral], and the bears was a-packin' the corn out there, and feedin' it to the hogs, fattenin' them for their own eatin' for their winter meat!"

It is possible—barely possible—though we doubt it, that two epitaphs more extraordinary than the following can be found. They are English, and now for the first time appear in American type:

ELIZABETH,
the Wife of Richard Barklamb,
passed to Eternity on Sunday, 21st May, 1797,
in the 71st year of her age.

RICHARD BARKLAM,
the Anti-spouse Uxorious,
was interred here 27th January, 1806,
in his 84th year.

WILLIAM BARKLAM,
Brother to the preceding,
September 5th, 1799, aged 68 years.

When terrestrial all in chaos shall exhibit effervescence,
Then celestial virtues with their full, effulgent, brilliant
essence,
Shall with beaming beauteous radiance through the
ebullition shine,
Transcending to glorious regions, beatifical, sublime;
Then human power absorbed, deficient to delineate
such effulgent lasting sparks,
Where honest plebeians ever will have precedence
over ambiguous great monarchs.

Mike was in tempur and in sole sinere
Ann Husband tendur and a fathur deere
He was a fathur kind
And modist was his mind
A great blessin to a umman
Never mor was givn
Nor a greeter loss eksept the loss of heavn.

THIS from a Southern friend: During our little war with the Seminole Indians of Florida a gentleman of Charleston, South Carolina, was drafted, and desiring to obtain a substitute, published the following advertisement:

WANTED—An able-bodied man accustomed to fight Indians, to whom liberal wages and constant employment will be given.

THE Crédit Mobilier investigation has not been so fruitful in promoting mirth as some other events in our history, but it did cause a little fun in Iowa. During the investigation one of our Democratic friends, thinking he had now got something with a good handle to it, thus accosted the postmaster of a small town in the northern part of the State:

DEM. "Well, what do you think of the Crédit Mobilier investigation now?"

P. M. (*confidently*). "Oh, that's all right; England will have to pay that."

DEM. "England have to pay it! What's England got to do with it?"

P. M. (*more confidently*). "Why, of course, England's got to pay it."

DEM. (*wonderingly*). "What has England to do with the Crédit Mobilier?"

P. M. "Why, don't you know it has been decided that England has to pay the Alabama claims?"

DEM. "Of course; every body knows that. But what have the Alabama claims to do with the Crédit Mobilier?"

P. M. (*triumphantly*). "Why, isn't Mobile in Alabama? What an ass!"

Of course, our friend was convinced.

Professor Jingo and the Skull.

"If I only had a skull," said Professor Jingo; and then he went to sleep and forgot all about it.

Presently he went out to work in his garden, where he finds the very thing he wanted!

"Perhaps I can contrive a plan to make its jaws open and shut with a spiral spring, or something."

He succeeded too; but the thing got hold of his finger, and wouldn't let go.

"Perhaps I'd better consult Dr. Pipes about it."

"Bad case of locked-jaw," said Dr. Pipes; "but I think I can relieve you." "You never shall saw my arm off if I know it," said Professor Jingo.

"Then," said Dr. Pipes, "we'll have to resort to a soporific."

When the soporific began to work, so did Dr. Pipes....

ADVICE GRATIS.—Be content with your lot, and let other people's skulls alone.

Professor Jingo is agreeably surprised to find it all a dream—his arm had been asleep too.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCXCI.—AUGUST, 1874.—VOL. XLIX.

THE QUEEN OF AQUIDNECK.

NEWPORT, FROM FORT ADAMS.

THE great centres are deserted more and more every summer, though the showy and meretricious hotel life at the spas and sea-side is steadily growing into disfavor. Sensible and self-contained persons have become weary of discomfort, dissipation, and heterogeneous crowds under the name of pleasure, preferring to choose their own society, and to make their own domestic arrangements. At a popular resort there will always be pretentious hostelries and people to patronize them; but the decided tendency is to what is known as cottage life, on account of the privacy, independence, and freedom it secures.

As a place of summer residence Newport has no peer. Its transient visitors are comparatively few, the business of the public-houses being less than it was ten years ago. But its cottage or villa population increases every season, as is shown by the regular and rapid advance in real estate. The situation, at convenient distance from Boston and New York, and easy of access from any point, is to its advantage; but its chief reputation rests upon its salubrity, its delightful coolness, its excellent society, and its exalted prestige. Newport should be fashionable, for it has a conspicuous history and memorable antecedents. Commercially the old town is insignificant; but it has reason to

be proud of its past, and may be in some sort justified for the complacent view it takes of itself. It should have had the aboriginal name of the island, Aquidneck (Isle of Peace), on which it stands. Aquidneck is apt, pretty, and picturesque, while the present christening is devoid of propriety, pertinence, or beauty.

Near the southern end of the largest of a cluster of islands in Narraganset Bay (the island is fifteen miles long and three and a half broad), Newport was first settled in the spring of 1639—a year later than Pocasset, now Portsmouth, at the northern extremity of Aquidneck. The pioneers were John Clarke, William Coddington, Anne Hutchinson, and a few others who had fled from the theological persecution of Massachusetts, where the colonists had created God after their own image, and demanded that every body should see Him through their bigoted eyes. This egotistic rigor and spiritual self-consciousness they termed religion, holding that the first principle of divinity is to expel the last remnant of humanity. Founded upon tolerance, the little plantation prospered. Very soon went thither the Quakers whose ears had been cut off and whose tongues had been pierced with hot irons by the Puritans in evidence of their hatred of the persecution for which they

Entered according to Act of Congress, in the year 1874, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.

GEORGE FOX.

had exiled themselves. The Quaker influence was strong and good, and continues to this day. The denomination is larger in Rhode Island, in proportion to population, than in any New England State. The annual June meeting of the Friends at Newport is numerously attended from all the States of that section, and has been for years one of its few local events. George Fox and John Woolman have preached in the town; and many of their followers may still be seen in its quaint and narrow streets, looking as prim, demure, and unruffled as if they had been laid away in starch a hundred and fifty years ago, and been awakened by the noise of the nineteenth century.

About the beginning of 1700 came a number of Dutch Jews, and subsequently some wealthy Spanish and Portuguese families, who added materially to the prosperity of the place. The synagogue, dedicated in 1763, and re-opened with solemn service in 1850, after sixty years of closure, is one of the noted buildings. The Jewish Cemetery, also in Touro Street, contains the remains of many of the prominent Hebrews of the past; among the rest those of Moses Lopez, reported to have been the last resident of his race. Abraham and Judah Touro—the street is named after the former—left liberal bequests to the city; and Abraham Riviera, once a leading Israelitish merchant, bore the highest reputation for integrity and generosity. A large ship-owner, the loss of many of his vessels forced him into assignment.

His creditors made easy terms with him, and he resumed business, in which he so prospered that, at the end of a few years, he invited those gentlemen to dinner. In addition to rich viands and choice wine, they found under their plates checks for the entire amount of the original debt with interest added.

A conspicuous figure in the early society of Newport was Abraham Redwood, born on the island of Antigua, and carefully educated in Philadelphia. He married in Rhode Island while still in his teens, and lived there until he was eighty, dying about the close of the last century. He was one of the founders of the library which bears his name—it stands in Touro Street—and his public and private donations still keep his memory green. The library is a handsome Doric structure. It had the same architect—Harrison—as Blenheim House, and contains nearly twenty thousand well-selected volumes.

During the colonial era Newport flourished like the convolvulus. It was a rival of New York and Boston, and one of the very first of the New England cities in commercial consequence. Its merchants, such as Henry Collins, Joseph Jacobs, Godfrey and John Malbone, Samuel Elam, Samuel Cranston, and Colonel Gibbs, were princely in revenue and entertainments. They were really gentlemen of the old school—scrupulous of etiquette, imposing and pompous in manner, fond of display, liberal in purse,

JEWS' SYNAGOGUE, NEWPORT.

narrow in opinion, devotees of caste; they boasted of family, were connoisseurs in wine, imitated the mother country, observed theologic forms, and exchanged rum for slaves.

The slave-trade was very active in Newport, not less than fifty of its vessels having been engaged in the traffic. Even the Quakers held chattels; and as late as 1804-8, out of 202 slave-ships fifty-nine were from Rhode Island, though none other of the Northern States, except Massachusetts and Connecticut (they each had one), had any part in the hideous commerce. The Legislature denounced slavery as early as 1652, and made it penal to hold a slave more than ten years. Yet the first merchants and gentlemen bought and sold and kept the poor negroes because they found profit in it.

During the French and Spanish war (1740)

THE REDWOOD LIBRARY.

JUDAH TOURO.

the town fitted out privateers. There was a regular packet line to London, with over six hundred ships arriving at and departing from port, at least two hundred of which were foreign. The docks, extending a mile along the harbor, were thronged by several thousand sailors, and crowded with the produce of both Indies. Distilleries and manufactories were busy; handsome mansions and graceful gardens decorated the neighborhood. Gentlemen dispensed generous hospitality in scarlet coats, lace ruffles, powdered hair, and diamond buckles, with swords at their side; and belles in brocade, patches, glittering jewels, and high-heeled shoes danced the stately minuet to the admiration of their gallants, and to the movement of measured music. Newport was a gay social capital; flattered itself upon the possession of the best blood in the land, the fairest and highest-bred women, the most munificent of entertainers, and talked complacently of a society not excelled in any of the courts of the Old World. Men drank deep in those days, and were not always delicate in their cups, but they were no worse, and often better, than their friends and kindred beyond the sea. The town was the resort of many cultured strangers and distinguished foreigners. Its boys and girls were carefully educated, and taught all the accomplishments of the time. It enjoyed a transatlantic reputation for elegance and hospitality, and was not unlike some of the capitals of mediæval Italy. Those were not the days of Quaker simplicity, but even the prosperous Quakers caught the infection of enter-

ABRAHAM REDWOOD.

tainment and conviviality, and bade wit and beauty to luxurious boards.

The Revolution was a revolution indeed to Newport. The first gun at Lexington sounded the doom of its commercial prosperity, and reduced its population more than half. Such a community, buoyant with vanity, bloated with ease, would naturally be conservative, patient of British aggression. But most of the Newporters were quick to flame with patriotism, preferring country to cash, and willing to sacrifice what they could no longer enjoy with honor. Some of the citizens found it hard to surrender the loyalty which had grown to be a pleasant and advantageous habit, but the people were in no mood for trimming, and compelled sympathy with the rebellion. The residence of the British forces upon the island was disastrous. Nearly a thousand buildings were burned; all the trees were felled; the churches were used for barracks and hospitals; the Redwood Library was robbed of its most valuable books. The hatred of resident Tories was

such that the invading soldiers were obliged to guard them from the fury of the people, and all who could fled from the popular wrath to provinces still loyal to England.

Almost the sole compensation to Newport during the Revolution was the brief occupation by the French. Many of their most gallant and accomplished officers—distinguished members of the nobility, like the Dukes de Lauzun, de Vauban, de Champceretz, the Marquises de Chabanes, de Chastellux, and Bozon de Talleyrand—accompanied the fleet, and their fine manners and chivalrous courtesy were in such shining contrast to the rudeness and vandalism of the British, whose investment they succeeded, that it is not strange they made a favorable impression. The gay and satiated Frenchmen were delighted, after their easy sentimental conquests at home, to seek new triumphs in the insurgent colonies, whose women they had regarded as gentle and ingenuous savages, only too happy to be won. They were greatly and not disagreeably disappointed to find, in the place of savages, beautiful and cultured ladies who could talk to them in their native tongue, and who were mistresses of the delicate art of coquetry, which, while full of enticement, stops short of imprudence, resting sweetly secure upon a graceful conventionality. That the courtly foreigners were generous allies added necessarily to their attractions, rendering attention natural and friendship easy. Admiral De Tournay, who commanded the fleet, died soon after his arrival, in consequence of mortification caused by his non-success, and was buried in the old Trinity Church-yard. Count de Rochambeau, chief of the army, had no reason to complain of his military record in this country, and the management of his soldiers was worthy of his fame as a soldier and a gentleman. The French officers wrote home glowing accounts of the courage and fortitude of the American people, and of the purity and loveliness

FRIENDS' MEETING-HOUSE.

of the ladies they had the honor to know. In 1781 General Washington paid a visit to Rochambeau, whose head-quarters were in the Vernon House, Clarke and Mary streets, and was received with every demonstration of gratitude and joy by the troops and citizens. The bells were rung, cannon fired, houses illuminated, and civic processions formed, while the air shook with acclamations of welcome.

With the independence of the States, the French army returned, regretting and regretted. Having given and received amorous wounds, they sailed home with many love-longings and tender mementos, and often referred to their Newport life with enthusiastic tongue.

In 1784 the town was incorporated as a city; but the destruction of its property and the dispersion of its inhabitants had precluded its prosperity. The mould of retrogression was upon it, and could not be removed. Three years later it surrendered its municipal form, which was not resumed till 1853. From the close of the Revolution to about 1830 Newport was as lifeless as Lycurgus. Then it began to be known as a watering-place, Providencers, Southerners, and Cubans being the first to frequent it. There were no public-houses of any extent or

RESIDENCE OF GOVERNOR CODDINGTON, NEWPORT, 1641.

excellence, and habitués put up with certain material discomforts for the sake of the bathing and the balmy air. The Ocean House was burned down—as all summer hotels are, soon or late—nine years after it was built, and rebuilt promptly on the old and present site, in Bellevue Avenue. The town consisted of a few streets near the water-front, and the cottage era had not been dreamed of. The first sales of real estate were made, some thirty years since, to Robert Johnson, an Englishman, and Alfred Smith, a New-Yorker, the pioneers in the purchase of property. Smith, unaided by the originality of his patronymic, has become the possessor of real estate agents there, nearly all

OLD-TIME HOUSES.

COAST SCENE, NEWPORT.

the transactions of the vicinity being made through him or his firm, Alfred Smith and Sons. He quitted the metropolis for his health, and going to Newport, decided to turn landscape gardener. With this view he bought, in company with a friend, a tract of land, unthinking of speculation, but expecting to get his compensation in engagements to lay out the grounds. The land rose so rapidly on his hands that he gained a small fortune by dividing it into lots for residences. Putting up cottages and villas soon became the mode, and from those of a plain and unambitious sort sprang the most expensive and luxurious ones.

Within twenty years real estate has increased twentyfold, and is now so high that eligible sites are beyond the reach of those not blessed of worldly goods. The number of cottages—the more elaborate of these are usually called villas—in and about the town must be fully five hundred, some two hundred of which are to let every season on account of the absence of their owners in Europe or elsewhere. They rent, furnished, for from \$2000 to \$8000 the season—the latter an extreme rate, \$3000 to \$4000 being near the

average. The time when one could live economically there, unless in a boarding-house, is not likely to return. As a summer residence Newport has grown to be a luxury forbidden to the many. The cost of erecting and furnishing a villa that would be thought in any sense elegant, including the ground and the laying out, is from \$50,000 to \$200,000. Some of the houses are really beautiful—all that taste and money can make them. They are in different styles, French villas, Swiss chalets, and English cottages most abounding, with a few of so composite and inharmonious an order as to defy determination. Bellevue Avenue, until recently, has been the favorite and fashionable quarter; but it is so nearly filled that it has been rendered necessary to seek other localities. The most handsome, and of course most expensive, residences are in that avenue, though the Bath Road, Cliff Walk, Touro Street, and Narraganset Avenue are very little behind it in the quality of the dwellings. Nowhere else are there so many dainty roofs to cover the darlings of fortune from July and August floods of sunshine. Rose-wood, French walnut, damask, lace, marbles, bronzes, engravings, paintings, cabinets, carvings, frescoes, aquaria, ferneries, porcelain, make interiors brilliantly attractive; and statues, grottoes, terraces, conservatories, fish-ponds, arbors, summer-houses, hedges, parterres, yield symmetry and charmfulness to grounds and gardens which can not fail to captivate the eye

and stimulate the fancy. Many of the villas are so shut in by shrubbery as to be hidden from the street, but pleasant laughter and sweet voices and high-bred accents heard through the foliage paint pictures to the imagination fairer than the closest inspection may reveal. It is pleasant to drive through the fashionable quarters, and observe how comfortable, if not contented, large incomes can render most people in this world. There is an air of unmistakable gentility about Newport that few watering-places have. Neither there nor any where under the canopy are the majority of the men and women cultured and chivalrous, beautiful and elegant; but the society is generally good, and its manners are unobtrusive. There are no horse-jockeys, blacklegs, billiard-markers, nor cozeners masquerading in the ill-fitting garments of gentlemen; no ballet-dancers, clairvoyants, demireps, nor adventuresses flashing in jewels and jadery, with a mistaken notion of fine-ladyism. Those who are under-bred do not strive to cover their deficiency by pronounced and blatant proletarianism. On the contrary, they restrain themselves, and thus take their first lessons in self-discipline, which is the foundation of agreeable behavior. Nobody need be offended by uttered coarseness or flaunting vulgarity on the borders of the Narraganset. Life there has a certain quiet neutral tint, notwithstanding its under-hue of richness, that seldom flares and never flecks.

The topical fault of the greater part of

CHARLOTTE OUSHMAN'S RESIDENCE.

the villas is that they are too far away from the sea, not within sight or sound of it even. In Bellevue Avenue, for example, you might, for all the glimpse or suggestion of the ocean, be a hundred miles inland in the midst of a wide-spreading prairie or on a mountain plateau. For this reason the Ocean House sadly disappoints strangers. Its name leads them to look for the broad main stretching in limitless blue in front of the piazza, to hear the tumble of the breakers beneath their chamber windows. In point of fact, all the ocean they discover is printed on the bills of fare at breakfast or dinner. The avenue is before them, with its rolling carriages; fields behind and at either side of them. No music of the surf, no flash of the waves, on any hand. So it is with the Atlantic and Aquidneck, the only other summer hotels proper. They keep out of range

of the sea, as if the sea were a detective in search of them, with full proofs of their guilt, ready to pounce on them at first glance. If it were so, they would have no cause for fear. Since Nicholas Eaton reared there the primeval dwelling, old Ocean has never caught a glimpse of the land lying under and about those breezy inns. They are perfectly secure against capture by stratagem or surprise.

The villas on the Bath Road and on the cliffs are veritably by the sea-

A NEWPORT COTTAGE.

THE BEACH.

side, as more of them should be. To dwell by the sea and be beyond its vision is like living in the mountains where the mountains are not perceptible.

The bathing at Easton or Sachuest beach, commonly called the First and Second beaches, is not very good, as the waves are often full of sea-weed, and bring in not a few impurities and unwelcome fragments. It is entirely safe, however; the slope is gentle, and so gradual that one can go a hundred yards or more before he is beyond his depth. The frequenters of Newport, particularly the feminine ones, may be cynically said to be wedded to the surf, since they so seldom seek its company. Men are addicted to semi-occasional plunges, but women are not. Bathing is not fashionable—in the sea, I mean, of course—though not on that account alone does it meet with fair disfavor. Women dislike it because it so savagely assails the good looks they have, or think they have, or try to make themselves believe they have.

If it be true that loveliness when unadorned is adorned the most, it is never quite so true as when bathing dresses are in question. That marvelous she has not been born who could be comely in a garb impugning every principle of attractiveness, every line of grace. At Newport the bathers are usually either mere girls, not yet "out," or elderly ladies who have surrendered the social vanities—though not before the social vanities have surrendered them, without the least lingering regret.

That shattered idols do not always lose their worshipers is demonstrated by the Old Stone Mill in Touro Park. No structure in the republic has been so widely discussed, has furnished themes for so many learned discourses, graceful verses, fantastic speculations, and ingenious hoaxes. The literature of which it has been the source would constitute a small library, and be very interesting reading withal. For a long while it was believed to have been built by the Danes who coasted along the New England shore in the twelfth century, and a Copenhagen society of antiquaries so decided. Some of the residents still hold to the theory, and grow irascible at its contradiction. It may be pleasant to weave romances into matter-of-fact things, and cover quotidian affairs with idealization; but truth can not be choked forever. The Old Stone Mill can not be tortured into aught else. It is only that, and nothing more—a product of the seventeenth century, used for grinding corn, according to direct historical testimony. Still it is such an object of veneration there that outside barbarians will hurl at it endless jests. Last year some one declared it had been turned into an umbrella factory, and the paragraph went the rounds of the press. Native Newporters were shocked at the mere idea of such desecration, and shuddered at the possible profanity. The truth is, the Old Mill never appeared to such ad-

NEWPORT STATE-HOUSE.

vantage as at present. Its circular wall, with its pillars and arches, is nearly concealed by ivy and an exuberant trumpet-vine, that add greatly to its picturesqueness. On moonlight nights it is superb, and looks as if all that had been told of it might be true. Moonlight is to scenery what imagination is to life; it metamorphoses commonness into beauty, lends to platitudes a gleam of inspiration.

The Park, though small, is very handsome. The monument of Commodore Perry is fitly placed there, for he was a native of Newport, being a direct descendant of Thomas Hazard, one of the first settlers of Aquidneck. The home of the gallant commodore still stands, and is an object of patriotic curiosity and interest.

Another distinguished son of Newport was William Ellery Channing. He was born in the dwelling at Mary and High streets, his father having been Attorney-General of the State, and a lawyer of fine ability. Channing spoke of his place of nativity as the most interesting to him on earth, and universally acknowledged as the most beautiful in the whole range of our sea-coast. Washington Allston, the famous artist, who went to school there, married Channing's sister, and, as rarely happens, was strongly attached to his brother-in-law. But even a brother-in-law could love Channing. Rev. Charles T. Brooks, George H. Calvert, and many more noted men have resided on the island, and cherished it tenderly. T. W. Higginson, one of the daintiest and most charming of American authors, has made it his home for years, and is ever sounding its praises in the sweetest and purest prose. Newport has always been a favorite with artists in words and colors. It answers to their love of rest and beauty, and the oftener it is visited the deeper seems to grow their appreciation.

THE OLD MILL.

The drives at Newport are attractive; still more since new roads have been laid out and old ones improved. All the summer residents drive; it is the one thing they are all agreed to do. At any hour between sunrise and midnight vehicles of every sort, from the pony phaeton to the ambitious four-in-hand equipage, may be seen dashing over the Bath Road, or along Bellevue and Ocean avenues. The last is the finest, winding by the shore, and in full view of the sea. The regular drives are in the morning and evening, or rather afternoon, when every body takes an airing on wheels. The society of the place can be better judged of on the road than any where else. The men are at their politest, and the women at their best, and all appear on excellent terms with themselves, which adds much to personal interest.

At no other watering-place are the women so quietly yet so richly dressed. One will see at Newport, if he has traveled (as every body has in these days), how much American women are in advance of the women of any other nation in this regard. Extreme

THE PERRY MONUMENT.

of fashion, superfluity of ornament, flamboyant effect, garish combinations, are eschewed. There is little attempt to advertise wealth through the wardrobe. The striking is subordinated to the suitable; that which is gay is not confounded with what is gaudy. If you are socially inclined, you will be still more impressed with the Newport style of dressing; and you should see that, since driving costumes show what women have on, and evening costumes what women have off. The Puritanic mode is not adopted at receptions, dances, and parties, but the Godiva garb is not so much emulated as it is at many summer resorts.

The afternoon drive (particularly on Fort days), usually down Bellevue to Ocean av-

enue, and so back to town, is a superb pageant of carriages, handsome women, elegant men, and graceful children. The Fort days are Wednesday and Friday, when Fort Adams is thrown open to visitors. The band plays from 4.30 to 6.30 P.M., and between those hours the best society meets in the large inclosure, listens to the music, and exchanges greetings and good wishes, very much as the Florentines do in their Cascine. Landaus, phaetons, broughams, coupés, dog-carts, drags, clarences, victorias, are intermingled; Boston chats with New York, Providence with Cincinnati, Chicago with Baltimore, Hartford with Albany, New Haven with New Orleans, France with America, America with Germany, Italy, and Spain; each rich man feels confident of his air and his income, every fashionable woman secure in her breeding and the fit of her exquisite gown. Several hundred carriages may be often seen within the Fort at one time, and their contents represent a gay and charming cosmopolitanism—fairly illustrate the wealth and culture, the refinement and taste, the coquetry and comeliness, of the summer dwellers on the Isle of Peace.

The drive along the Bath Road leads to Paradise, Purgatory Bluff, the Hanging Rocks, Mianotonomu Hill, the Glen, and other places of fame and interest. Paradise, though not so attractive as its hyperbolical title would promise, is a pleasant grove of sycamores, bordering the base of a rocky elevation. Purgatory Bluff consists of great rocks on the beach (in one of them is a deep chasm twelve feet wide at top, and narrowing toward the base), against which the waves beat wildly in rough weather, though why it should be so called is in no wise apparent. Paradise and Purgatory are among the stock names of every popular resort. If there be nothing to fit the names, so much worse for the place, and so much better for the names, which must be used, and the cause of their bestowal left to the perplexed

THE DRIVE.

GRAVES ON THE BLUFF, FORT ROAD.

conjecture of the curious. The Hanging Rocks are the low, rocky, and sandy bluff skirting part of the Sachuest Beach. They are indissolubly associated with George, better known as Bishop, Berkeley, said to have meditated and partially composed in a natural alcove of the rocks commanding a view of the Atlantic his *Alciphron*; or, the *Minute Philosopher*. Every body, whatever his ignorance, who has been to Newport has heard of Berkeley, because the name can not be escaped. General acquaintance with the good bishop is limited to the fact that he lived there once, and was the author of the line,

"Westward the course of empire takes its way,"

invariably misquoted "star of empire." What he did before or after, if any thing, or what became of him, it is not deemed important to be informed upon. They who walk or drive over Sachuest Beach are certain to be told that those are the Hanging Rocks, where Bishop Berkeley wrote the *Minute Philosopher*.

I have been the recipient of such intelligence scores of times, and usually with an air of conveying a piece of black-letter erudition. I bore the would-be-learned patronage patiently during the first two seasons, but finally, on the resumption of the wearisome iteration, I pretended ignorance.

"Who was Berkeley?" I asked.

"Well—well, he was an old fellow who used to live around here, a really jolly chap

they called Bish for short. He had, I think, been a Quaker, who fled from Boston persecution, settled on this island, took to fishing and drinking rum for a livelihood, got more rum than fish, and died of del. trem." This was from a fellow-Manhattanese, who had had so classical an education that he had forgotten the history of his own country.

The next time I was instructed concerning the author of a *New Theory of Vision* by a Boston (assumed) bas-bleu. She pronounced his work composed in the alcove as if "minute" were a part of time, and proceeded to tell me that it was an account of a man who became a philosopher in a minute.

An officer at Fort Adams believed that the *Minute Philosopher* had something to do with minute-guns; and a Chicagoan thought Berkeley the same person who had been hunting out West (Grantley Berkeley), and pronounced him a capital shot.

Since then I have formed a habit of telling my companions to the Hanging Rocks about the amiable scholar who, according to Pope, had "every virtue under Heaven." I give De Quincey's humorous version of Berkeley's disputatious encounter with Malebranche, which resulted in the death of the able and ingenious author of the *Search after Truth*, and the account is commonly accepted as literally true.

Berkeley's dwelling still stands upon the Green End Road, in the valley, near a hill commanding a fine prospect. He called it

THE GLEN.

Whitehall, after the palace of Charles I., in whose cause his ancestors had mistakenly suffered. He frequently preached in Trinity Church, and after his return to England (1731) he sent the congregation an organ, still in use. The old church and its graveyard are extremely interesting from their age and historic associations.

Mianotonomu Hill is coupled with many aboriginal traditions, in which the spirit of romance is fully preserved—the dusky maiden made to fall in love with the white settler, and the dusky father to fall before the settler's rifle.

The Glen is a picturesque dell upon the eastern shore of the island, winding through a wood to the water, and is sometimes called Lovers' Retreat, albeit there is no reason why lovers—they are more prone, I understand, to advance (on each other with open arms) than retreat—should retreat so far, when billing and cooing may be safely and even sympathetically conducted in-doors or out-of-doors in any part of Aquidneck. The trees of the Glen have the attraction of nov-

elty, for they have been very scarce since the invading Briton laid so many low at the time of his occupation.

Spouting Rock is below the Neck on the Ocean Avenue drive, and, especially when the sea is rough, dashes a volume of water through a hole in an overhanging cliff, against which the waves advance only to retire and advance again. It forms an original hydric picture, and would make a fine natural shower-bath.

The Forty Steps, among the Cliffs, is a pleasant place of repairment, and they go most who are most impelled by sentiment. The steps lead to Conrad's Cave, christened after Byron's romantic corsair, and the couples entering it, attuned by love or sympathy, usually tarry so long that they are presumed to be

studying the natural geology, whose most grateful lessons are imparted by the lips.

The Cliff Walk is one of the pleasantest parts of Aquidneck, and is fully appreciated by the winsome estivaters. It is the romantic promenade of the place, breaks the monotony of drives and entertainments, and must be wholesome, because it brings one into the sanctuary of Nature. The rocks are wild, multiform, picturesque, bristling with quaint resemblances, and many-colored under the changing light. The sea lies green and glorious before them, and the clouds marshal themselves overhead—a shadowy and shifting army marching in the cause of Beauty to the music of the spheres. Standing or strolling there, reverie, like an invisible spirit, drops down from the sky, comes up from the deep; the feeling of childhood revives; the longings of life seem near of attainment; the waves murmur of the miracles of hope.

On moonlight summer evenings flirtation, simple, serious, and fatal, is so common on the Cliffs as to be endemic. The amatory

disease is to be seen there in all its stages, from the incipient symptoms to the confirmed and alarming condition for which Dr. Hymen alone has a specific. Any man may diagnose the cases, but only he can cure.

The Dumplings, as the rocks on Canonicut Island, opposite Aquidneck, are called, furnish an excellent panoramic view of Newport and its pictorial surroundings. They lie not far from the entrance to the harbor; are diademed with the ruins of an old fort, or martello tower; are not only picturesque in themselves, but reveal the picturesque wherever the eye can reach. Not to visit the Dumplings is like going to Naples without climbing Vesuvius, or doing Switzerland and avoiding the Zermatt. The obligation is imperative, and, different from most duties, its discharge is very agreeable. Those ragged rocks and mouldering remains are one of the many points to sail to, and sailing is a delightful pastime of the summer population.

The blue, beautiful Narraganset is full of enticement to all lovers of the water and the pictorial in nature, and a yacht is as much a part of the season's equipment as a handsome turn-out or an exhaustless toilet. Besides the yachts owned by the villains, the yacht clubs of New York, Boston, and Brooklyn often meet there, and in the interval between marine contests and excursions hither and thither the members enjoy the generous hospitality of the seasoning islanders, and repay in kind. Block Island, Martha's Vineyard, Shelter Island, Nantucket, and Cape Cod are frequently visited by the yachts, and some of the trimmest and fastest are always lying in port between May and October. The social sailing parties are of the merriest.

Anglers need not pine at Newport for lack of sport. They can catch shining perch in Lily Pond,

bass or blue-fish from the Bass Rocks on the Cliff side, or from Gooseberry Island, opposite Bateman's Beach, or, rocking in boats, take tautog, indigenous to Narraganset, and palatically prized by the dwellers near its waters. The last is rare diversion to all who do not object to the cradle of the deep and the bronzing brushes of the sun.

A marked lineament in the social face of Newport is that its dissipations are home-made. The place imports nothing but its visitors, and most of these are regular enough to be thought domiciled. It has no races, fond as are many of its habitués, and large owners as they are of horses—substituting private riding and driving for the excitements of the turf. The city contains an opera-house, guiltless of opera—not because it can not support one, but because it does not want one. The works of Mozart, Wagner, Verdi, Bellini, may be heard in Boston and New York at other seasons, and the sea-side swallows desire on the Narraganset what they can not get along the Mystic or the Hudson. The gayeties are strictly social, and yet abundant. There are

THE CLIFFS.

CLIFF WALK.

two clubs, the Newport and Casino, and they give ladies' receptions from time to time. Masculine exclusiveness is not encouraged; on the contrary, every effort is made to suppress it.

Entertainments there are many. Besides picnic and boating parties, horseback riding (some of the ladies sit a steed like Diana Vernon), bathing, driving to all points, and wandering on the Cliffs, there are in-door amusements and dissipations without end. Dinner-giving is a specialty of the place, and fish, fowl, and vegetables may be had so fresh that they would thrill the heart of the New England housewife. But she belongs to the old town: her place is supplied in the new quarter

by professional caterers and French cooks. And it is better so. When she can afford it, most of us would prefer our hostess should give her graceful attention to the guests instead of her nervous anxiety to the kitchen. Baked lady is not half so good for the first course as a savory potage. Breakfasts, luncheons, and teas, dainty and appetizing, are part of the social order, and yet in all the eating form and fineness are more than food. These meals are not heavy dinners differently labeled, nor are the dinners of the old English sort, to which the baronial Malbones were wont to bid their friends, when profusion and punch passed for hospitality. Nothing too much, is the present maxim of junketing and junketers, and it is generally carried out. Recently this excellent custom has been somewhat violated, and mainly by New York millionaires, who think dinners niggardly without a dozen courses and as many kinds of wine. But the rule remains, and some of the best people are unambitious of display, are indifferent if their income be reckoned by judicious expenditure. One hears there of charming breakfasts and dinners, which borrow more from those at the table than from the table itself. The guests, after all, are the true sauce of the meat, the best bouquet of the wine. The parties of the season represent something more than fashion. There are hearts below bodices, and minds under coils of hair.

The summer Newport is not a large community—four or five thousand at the most—but it has divers circles, some of which touch, but never mingle, and more of which recognize though they do not sympathize with each other. The leading elements are Boston and New York, and the tone of the former, candor compels me to say, is rather the better on the whole. Boston does not dress so well as New York; is not so round, so graceful, so mellow; has nothing like the style. But it regards more the furniture of the mind and the spiritual aspects of life; its vanities are the vanities of culture, Bunker Hill, and the *Mayflower*, rather than of Worth gowns, first-water diamonds, and high-stoop mansions—whether you can read the title clear to them or not.

Newport differs from most sea-side resorts in the fertility and color that it shows. Commonly they have the broad ocean and strips of sand, on or near which are hotels and cottages glinting in the sun—nothing to relieve the barren and the baking semblance. The Isle of Peace is the home of hues. In addition to the blue bay, the emerald main, the rocks, green, brown, purple, red, the dwellings and shops in the old town, of many shades, and the villas, white, yellow, umber, orange, gray, deep crimson, there is a luxuriant vegetation, and the numerous gardens bloom in variegated beauty. All along Belle-

vue and other avenues are geraniums, roses, bignonias, heliotropes, hydrangeas, verbenas, gladioli, portulacas—a wilderness of flowers, native and exotic, filling the air with perfume and the eye with beauty. The Vale of Cashmere, as poets paint who have never seen it, seems to have been transferred to Aquidneck, covered as it is with the choicest dyes of Nature's choosing. Beds upon beds of fair and fragrant plants invite and dally with the amorous sunshine; the vines of hanging baskets tremble to the whispers of the breeze; the sea flushes with the varying light, and, like a monster chameleon, takes its hue from the overhanging cloud.

The temperature of the island is remarkably mild and equable for the latitude, forming an exception to the remainder of New England. The mercury seldom falls below zero in winter, or rises above 80° or 85° in summer. During the latter season residence there is a sensuous enjoyment. The sun's rays are tempered almost always by a steady and refreshing breeze from the Atlantic; so constant is it, indeed, that the trees of Aquidneck have an inclination to—one might nearly say an affection for—the loyal and loving wind. The air is so deliciously soft that it rarely seems raw even in cold weather. It has none of that penetrating, marrow-chilling quality peculiar to the coast of the region, and invalids say it is to them like draughts from Hygeia's cup. Meteorologists explain the delicate and dissenting atmosphere by the contiguity of the Gulf Stream, which, as the alleged cause of endless phenomena, material and moral, is entitled to serious consideration. The Gulf

THE DUMPLINGS.

Stream is one of the last lingering sources of faith in this age of skepticism.

The nights on the island are the nectar of repose. A close or sultry night, even in the solstice, is hardly known. There is rest in the influence of the sky, and freshness drops from the breeze's wings. As tradition runs, death comes not to the dwellers there. To be mortal, they must be un-Newported: they who are weary of existence go to Boston for the east wind, or journey to New York and ride on the street cars. Surely the natives live long as well as leisurely.

BOAT LANDING.

Men of forty are called boys, and octogenarians middle-aged. Funerals take place at intervals; but the Sanhedrim of towns-folk discover on investigation that they who were buried have been seen at the Hub. Touching the villa people, the natives have little, if any, concern. Thames Street, narrow, quaint, characteristic, measured by spiritual distance is as far from Bellevue Avenue as the opposing poles. The fixed population, absorbed with the past, have a serene contempt for the fripperies of the present.

Odder creatures than many of the fishermen and sea-farers can scarcely be met. Weird and dreamy in appearance, they never rub their eyes lest they should awake to the unpleasant fact of the latter half of the nineteenth century. Insular though they be, they have wandered on many mains, and experienced the smallness of the globe. They can tell strange stories of voyages, strange as those of Mandeville and Pinto, and shine as pharos from their slender shore.

But, after all, the veritable Newport is the Newport of to-day. The Past is interesting,

but only the Present is ours. Stagnation is romantic, though Progress is the benison of time, and fraught with a romance beyond immediate appreciation. The tales of the old chroniclers sound soft and sweet through the distance, but their accents would be harsh and crude if they rose in the Now. The manners of the Malbones, the Elams, the Overings, and Bannisters would not bear the soft light of this early summer, and their boasted hospitality would be tainted with coarseness. We may read of the charming Hunters, Redwoods, and Champlins, of the beautiful Betsey Haliburtons and Polly Lawtons of half-forgotten generations; but in the fair republicans, preparing to haunt the Cliffs and add poetry to the Avenue, dwell a dainty grace, a pure elegance, and a radiant loveliness which none of those who flirted with the De Vaubans and De Lauzuns had intertwined with their dreams. Aquidneck has faded and crumbled—will never be again; but still is Newport queen; still she wears in her fragrant tresses the sweetest blossoms of Civilization, and holds her sway through an advanced and exalted Womanhood.

WASHINGTON PARK, NEWPORT.

THE PEARL OF THE PHILIPPINES.

By R. H. STODDARD.

"FOR THERE THE INFANT JESUS STANDS, AND HOLDS MY PEARL UP IN HIS HANDS!"

"I HEAR, Relempago, that you
Were once a famous fisherman,
Who at Negros, or Palawan,
Or maybe it was at Zébou,
Found something precious in the sand,
A nugget washed there by the rain,
That slipped from your too eager hand,
And soon as found was lost again.
If it had been a pearl instead
(Why does your good wife shake her head?)
I could the story understand;

For I have known so many lost,
And once too often to my cost.
I trade in pearls; I buy and sell.
They say I know their value well.
I've seen some large ones in my day;
I've heard of larger—who shall say
How large these unseen pearls have been?
I don't believe in things unseen.
I hear there's one now at Zébou
That dwarfs a bird's egg, and outshines
The full moon in its purity.

VOL. XLIX.—No. 291.—22

What say you—is the story true?
And what's the pearl called? Let me see—
The Pearl of all the Philippines."

'Twas at Manila, and the three
Sat in a shaded gallery
That looked upon the river, where
All sorts of sailing boats all day
Went skimming round, like gulls at play,
And made a busy picture there.
The speaker was—what no one knew,
Except a merchant: Jew with Jew,
A Turk with Turks, Parsee, Hindoo;
But still to one religion true,
And that was Trade: a pleasant guest,
Who, knowing many things, knew best
What governs men, for he was one
Whom many trusted, trusting none.
His host, Relempago, who heard
His questions with an inward shock,
Looked up, but answered not a word.
He was a native Tagaloc;
A man that was not past his prime,
And yet was old before his time.
His face was sad, his hair was gray,
His eyes on something far away.
His wife was younger, and less sad;
A Spanish woman, she was clad
As are the Tagal women; fair,
With all her dark abundant hair,
That was a wonder to behold,
Drawn from her face with pins of gold.
"You have not seen it, I perceive,"
Said the pearl merchant; "nor have I.
I'd have to see it to believe,
And then would rather have you by.
There's no such pearl." "You spoke of me,"
After a pause his host began:
"Yes, I was once a fisherman,
And loved, though now I hate, the sea.
'Twas twenty—thirty years ago,
And this good lady by my side
Had not been many moons the bride
Of poor but proud Relempago.
That I was poor she did not care;
She let me love her—loved again.
She comes of the best blood of Spain;
There is no better any where.
You see what I am. As I said,
I cast my bread upon the sea,
Or from the sea I drew my bread—
What matter, so it came to me?
We loved, were young, our wants were few:
The happiest pair in all Zébou!
At last a child, and what before
Seemed happiness was more and more
The thing it seemed, the dream ofme true.
You smile: I see you never knew
A father's pleasure in a child."
"Pardon, my friend, I never smiled:
I am a father. I have three
Sweet troubles that are dear to me."
"But ours was not a trouble—no,"
Said simple, good Relempago;
"It was the sweetest, dearest child;
So beautiful, so gay, so wild,
And yet so sensitive and shy,
And given to sudden, strange alarms:
I've seen it in its mother's arms,
Bubbling with laughter, stop and sigh.
It was like neither in the face,
For we are dark, and that was fair;
An infant of another race,

That, born not in their dwelling-place,
Left some poor woman childless there!
A bird that to our nest had flown,
A pearl that in our shell had grown,
We cherished it with double care.
It came to us as legend says
(I know not if the tale be true)
Another child in other days
Came thither to depart no more,
Found one bright morning on the shore—
The Infant Jesus of Zébou!"

"So you, too, had," the merchant said,
With just a touch of quiet scorn,
"What shall I say—a Krishna born?
But with no halo round its head.
What did you name the boy?" "A girl,
Not boy, and therefore dearer, sweeter—
We called the infant Margarita,
For was she not our precious Pearl?
You, who have children, as you say,
Can guess how much we loved the child,
Watching her growth from day to day,
Grave if she wept, but if she smiled
Delighted with her. We were told
That we grew young as she grew old!
I used to make long voyages,
Before she came, in distant seas,
But now I never left Zébou,
For there the great pearl-oysters grew
(And still may grow, for aught I know—
I speak of twenty years ago).
Though waves were rough and winds were high,
And fathoms down the sea was dark,
And there was danger from the shark,
I shrank from nothing then, for I
Was young and bold and full of life,
And had at home a loving wife,
A darling child, who ran to me,
Stretching her hands out when I came,
And kissed my cheek, and lisped my name,
And sat for hours upon my knee!
What happier sight was there to see?
What happier life was there to be?
I lived, my little Pearl, in thee!
Oh, mother! why did I begin?"
He stopped, and closed his eyes with pain,
Either to keep his tears therein,
Or bring that Vision back again.
"You tell him."

"Sir," the lady said,
"My husband bids me tell the tale.—
One day the child began to ail;
Its little cheek was first too red,
And then it was too deathly pale.
It burned with fever; inward flame
Consumed it, which no wind could cool;
We bathed it in a mountain pool,
And it was burning all the same.
The next day it was cold—so cold
No fire could warm it. So it lay,
Not crying much, too weak to play,
And looking all the while so old!
So fond, too, of its father; he,
Good man, was more to it than I:
The moment his light step drew nigh
It would no longer stay with me.
I said to him, 'The child will die.'
But he declared it should not be."
"Tis true," Relempago replied:
"I felt if Margarita died
My heart was broken. And I said,
'She shall not die till I have tried

Once more to save her.' What to do?
 Then something put into my head
 The Infant Jesus of Zébou!
 'I'll go to him: the Child Divine
 Will save this only child of mine.
 I will present him with a pearl,
 And he will spare my little girl—
 The largest pearl that I can find,
 The one that shall delight his mind:
 The purest, best, I give to you,
 O Infant Jesus of Zébou!
 'Twas morning when I made the vow,
 And well do I remember now
 How light my heart was as I ran
 Down to the sea, a happy man!
 All that I passed along the way—
 The woods around me and above,
 The plaintive cooing of the dove,
 The rustling of the hidden snake,
 The wild ducks swimming in the lake,
 The hideous lizards large as men—
 Nothing, I think, escaped me then,
 And nothing will escape to-day.
 I reached the shore, untied my boat,
 Sprang in, and was again afloat
 Upon the wild and angry sea,
 That must give up its pearls to me—
 Its pearl of pearls! But where to go?
 West of the island of Bojo,
 Some six miles off, there was a view
 Of the cathedral of Zébou,
 Beneath whose dome the Child Divine
 Was waiting for that pearl of mine!
 Thither I went, and anchored; there
 Dived fathoms down—found rocks and sands,
 But no pearl-oysters any where,
 And so came up with empty hands.
 Twice, thrice, and—nothing! 'Cruel sea!
 Where hast thou hid thy pearls from me?
 But I will have them, nor depart

Until I have them, for my heart
 Would break, and my dear child would die.
 She shall not die! What was that cry?
 Only the eagle's scream on high.
 Fear not, Relempago! Once more,
 Down, down, along the rocks and sands
 I groped in darkness, tore my hands,
 And rose with nothing, as before.
 'O Infant Jesus of Zébou!
 I promised a great pearl to you:
 Help me to find it.' Down again,
 It seemed forever, whirled and whirled;
 The deep foundations of the world
 Engulfed me and my mortal pain;
 But not forever, for the sea
 That swallowed would not harbor me.
 I rose again—I saw the sun—
 I felt my dreadful task was done.
 My desperate hands had wrenched away
 A great pearl-oyster from its bed,
 And brought it to the light of day;
 Its ragged shell was dripping red,
 They bled so then! But all was well;
 For in the hollow of that shell
 The pearl, pear-shaped and perfect, lay.
 My child was saved! No need to tell
 How I rejoiced, and how I flew
 To the cathedral of Zébou;
 For there the Infant Jesus stands,
 And holds my pearl up in his hands!"
 He ended. The pearl merchant said,
 "You found your daughter better?" "No,"
 The wife of poor Relempago
 Replied. "He found his daughter dead."
 "'Twas fate," he answered. "No," said she,
 "'Twas God. He gave the child to me;
 He took the child, and He knew best:
 He reached, and took it from my breast,
 And in His hand to-day it shines—
 The Pearl of all the Philippines!"

OUR NEAREST NEIGHBOR.

[Third Paper.]

DO you want a trip of twenty days and twelve hundred miles in a stage-coach, through charming scenery, the ride made piquant with possible kidnappings, robberies, slaughters, and such like pleasantries? Then come to the office of the Diligence Company, in the Street of Independence, back of the Hotel Iturbide, and get your billet and place. The ticket will cost you ninety-nine dollars. You can deposit another hundred or two if you wish, and receive a bill of credit, on which you can draw every night, where the coach stops, of an administrator or agent of the company. This avoids the necessity of carrying much silver about you, and so of tempting overmuch the rapacity of the robbers among whom your journey lies. A few dollars it is desirable to carry with you in order to satisfy them partially for their trouble in stopping and searching you, and to prevent their giving you their pistol because of your refusal to give them your pistols. If they should rob you of your bill of

credit, you can telegraph back the fact, prevent its farther use, and get a new one covering the amount then undrawn.

Armed with the ticket and the bill of credit, and with no other weapons, I take my seat in the coach. It is number one, the best back seat. I am the only through passenger, from the city to the northernmost port. It is a delicious morning in March; but as all mornings here are delicious, the remark is superfluous. The March wind is a June zephyr, and "December's as pleasant as May." The sun is not quite up, but the sky is gray with his sub-horizon radiance. The streets are silent and empty but for the rattle of the coach, which makes all the more noise seemingly because of the surrounding silence. We pass the first church built by Cortez. It is well in the fields to-day, and only frequented by a few poor neighbors. Close by it is the penitentiary, and here military and other executions frequently occur. Death is the regular punishment.

CHURCH BUILT BY CORTEZ.

A captain, when we were there, insulted his superior, was marched out here of a morning, and shot. Three men robbed a carriage on the paseo, and as soon as captured and condemned, were shot. Four kidnapers of a gentleman in the city were treated with like summary justice. The action of General Burriel is after the fashion of the race—drum-head court-martial and instant execution.

The church is surrounded by heaps of ruined huts, the adobe brick dissolving into its original dust. Mexico looks like Rome, half a ruin, both in its central streets, where convent ruins abound, and in these dust heaps, black and homeless, that fill up its eastern sections. We pass the gate and emerge on a hard pike, which leads to Tolu, about sixty miles away, a city founded by the Toltecs long before the Aztecs entered the land. We pass broad haciendas belonging to Mexican gentlemen, devoted chiefly to the culture of the maguey. A Mexican saw-mill, off the road, but near the city, affords a quaint sight. The Spaniards stripped the plains and nearer mountains of wood, and so there is no need to-day of a more expensive mill than the old-fashioned handsaw pulled lazily along an occasional log. Our steam saw-mill rapacity will soon effect a like result in our own land. Popocatepetl looks quietly down on the quiet sawyer.

The first village is like most we pass—a string of whitewashed huts flush with the roadway, no sidewalk coming between the door and the rider. This one, unlike the others, is largely occupied with game-cocks. A breeder of them is giving his brood the early morning air. They stand on a raised seat running along the front of his cabin,

prevented from general perambulation by a fastening to the foot. The trainer is teaching the young ones how to fight, holding a gray one up to a black beauty, and making each strike the other artistically. They are splendid birds, putting to shame the Shanghais and other gentry of bloodless and fightless fame. But even if of a fighting race, they have to be taught to bite and devour each other, and patiently taught. So brave nations drill their braver soldiers to fight, and then declare their natural animosity causes war.

My first scare occurs just out of this gamy town. A company of horsemen come riding down on us from a rocky hill-slope up which our half-sick mules must slowly pull, for the epizootic is in the land. The gay-caparisoned riders, as they appear wrapped in their red and blue serapes, are sufficiently brigandish to stir the fever in the timid blood. No weapon was mine save my mother-wit, and that was an exceeding dull weapon, and would be very clumsily used in the unknown tongue. So I wait patiently the coming of the foe. On they drive, nearer and nearer to us, on us, past us. "Á Dios" is the only shot they fire. They are muleteers from Chihuahua and Durango, going to town, a long three weeks' trip, to dispose of a few sorry mules. Time is of no value here. Two months and twenty dollars profit are good equivalents. So ends our every fright the whole journey through. The road opens on an upland that spreads out into fields bounded by lofty hills. Zumpango and its lake lie to the left. This lake is the chief peril to the city of Mexico, and has been since, if not before, its discovery by the Spaniards. It is the highest and largest of a series of lakes that lie on a higher level than the town, and whose overflow, caused by freshets from the surrounding mountains, has more than once imperiled the city. Immensely costly dikes have been built to prevent this deluge, and attempts made to drain the lake westward into the Tolu River. But the latter undertaking has never been carried out, and the former are so imperfect, through neglect, that they are comparatively useless in extraordinary cases, though they sufficiently defend it against ordinary seasons, when it needs no defense.

The day's ride ends early, by four in the afternoon, with a pleasant descent from very rough and rocky and barren uplands into the basin of the river Tolu. We run by sheltered nooks of green, trees fresh with spring leaves, old churches romantic and sleepy, across bridges perilous but pretty, and into the broad and empty square of Tolu. The Toltec remains here are said to consist of gigantic pillars. I saw a fragment of one in our tavern yard, and heard of a yet more famous one on the hill-side—a pillar named Malinche, after the favorite

of Cortez. I tried in vain to get a boy to lead me to this site and sight. No real, doubled or trebled, stirred him to the walk. So it was taken alone. But it was too dark when I climbed the hill to discover the ghostly face of the Toltec Malinche. The walk paid, for it was through pretty groves, amidst very green meadows, and across a bridge of solid stone, with recesses for seats, such as are not found even on the best suspension-bridges of our country. Will the East River Bridge have them? What splendid views such side seats, forming a part of that magnificent structure, would afford up and down that lively river!

The road from Tolu to Queretaro, our second day's journey, was more rough and more romantic than the first. It ran through the broad parks that are every where in Mexico inclosed by lofty ranges of mountains. It passes through several villages, which are simply a street of huts, alongside spacious and well-kept haciendas, whose green-growing and brown plowed fields are in admirable order. Twenty miles out of Queretaro we rattle and rock and toss and well-nigh founder over the terrible rocky descent into the lovely valley of San Juan (if you wish to be very Mexicanish you can pronounce this San Hwaun). A city of fifteen thousand inhabitants welcomes us at the base of the mountain. Its pleasant arcades and thick walls are well tinted in green, yellow, blue, and other high colors. Its market-place is full of hucksters, with their wares spread beneath a huge umbrella eight to ten feet in height, and as much in diameter. They are often rent and ragged, and afford only a slight shelter from the burning rays. But the market-woman seems contented with this semi-protection, for she sits quietly amidst her little pile of fruits and vegetables and earthenware, and strings of meat, awaiting the customer with his *cuartilla* or *tlaco*, the first a quarter of a *medio*, which is a half real, around which latter coin all the rest grow, large or less. The *cuartilla*, or cent and a half, is the smallest Spanish coin, though the *centavo*, or our cent, is of late creeping in. The *tlaco* is an Aztec word and coin, and is about half the value of the *cuartilla*. Drop the

MEXICAN SAW-MILL.

double *U*'s in pronunciation if you would approach the true Castilian. One *l* is pronounced; two destroy each other. Two affirmatives make a negative

here, according to the general rule of contraries to our habits that governs Mexicans.

Here, too, you meet a large variety of that nuisance of the country—the beggar. They gather about the coach in great numbers—decrepit old men, lively old women, blear-eyed, blind-eyed, scabby, crouching, leering, horrible. Now and then a younger woman and girls and boys put on the beggarly garments, and whine; but usually the older folks absorb this business. They have suppressed them in the capital, but they flourish fearfully in the provinces.

From San Juan to Queretaro is our second and worse scare. This is the most dangerous bit of road in all the twelve hundred miles; and yet it is close to a large city well stocked with soldiers, a detachment of whom could patrol the road and easily preserve the peace and safety of the traveler. We shiver as we ascend out of the town. Four of us there are—a Jew carrying a box of jewelry to Queretaro, a Frenchman, a Mexican, and an American, all armed save one. The slow toiling mules drag us into peril, but can not easily drag us through it. But we do drag through, and reach the last *posta* before Queretaro in safety. Here dangers thicken. This dirty row of huts is called Colorado. Its dirtier rows of begrimed men

MEXICAN BEGGAR.

sit along the benches of its drink shops, for no place sinks so low or soars so high as to get out of the reach of these temptations. They eye us from under the coats of dirt upon their faces, and evidently reckon on some game in that cage for their rifles. The driver rushes from the stables with the usual whirl and mad display with which the coachman enters and leaves the towns. But in this case it is evident that his scare adds wings to his speed. We fly through the village, in among the stunted oaks of a moderate hill-slope, up the rough road, hardly abating our speed, for oaks are splendid for ambuscade, and we scarcely walk our tired mules until we emerge from the last low thicket that overhangs the valley and the city of Queretaro.

There we pause, for there we are safe. The situation of this city is very beautiful. None in Mexico more so. Mountains high hang all around its southern and eastern sides. The west and the north lie open and level. The valley is tropically green, which is a verdure the North scarcely knows in June, for the intense life of nature reveals itself in this depth of color. We rattle and race down at greater peril to life and limb than any Colorado robber could cause, and come at its base to a superb aqueduct, stretching from hill to town, like the old Roman arches across the Campagna. It is the best preserved and the most romantic of these constructions that I have seen in the country. Only that of San Cosme in the city can equal it in solidity, but neither that nor any other equals it in attractiveness. For that creeps along by the side of city

streets; this strides across the valley, high and lifted up. We rush through the narrow-streeted town, and disembark at the Hotel Diligencias. Beggars greet us before we can escape to our rooms.

This city is chiefly famous for being the place where Maximilian was captured and shot. When Mr. Seward had placed a little body of sixty thousand men, under General Sherman, on the Rio Grande, he dropped Drouyn de l'Huys, Napoleon's Secretary of State, a note, saying it would be agreeable to the President if his Majesty would withdraw his troops from Mexico. Napoleon was very anxious to please the President, and hastened to comply with his request. The little body of men had of course nothing to do with this compliance. Carlotta went with the troops to beg assistance for her husband. He should have gone also, but he believed the Church party strong enough to maintain him in power, even without French or foreign help. So he foolishly remained. Juarez, the republican leader, came in as Bazaine went out, re-organized his troops, and moved down on the capital. Maximilian, fearing his safety in that political centre, retreated northward a hundred and forty miles to Queretaro, a very fanatical town. He marched into the jaws of death, into the mouth of hell. Juarez came down upon him, and encompassed the city with his armies. He built forts on the mountain, and also west of the town on a lower knob called the Hill of Bells. Maximilian took shelter in the Church of the Cross, whose adjoining convent inclosure, with its high and huge walls, seemed ample protection. Juarez shelled the town, captured the church and its illustrious contents, and took him to the fort on the Hill of Bells, before which he was shot.

The prospect from the hill is very lovely. Around are acres and acres of level land thick covered with greenest lucerne and other produce for the neighboring city. The towers and walls of the sacred city gather at the end of the fields and gardens in a recess of the mountains. Behind it tower the tall hills, brown and blazing in the setting sun. The whole scene is placid and lovely as a sleeping babe. How different when blood and fire and vapor of smoke filled all the hollow!

"Death rode upon the sulphury siroc,
Red battle stamped his foot, and nations felt the shock."

This inland town and this tiny hill made sorrow and trembling in the Tuileries and Schönbrunn. Consternation awoke in all courts as the stern decree was executed that announced to all the world that European monarchs must "hands off" to all American nationalities, and ere long to all American soil.

Manufactures are creeping into Queretaro.

A ride of two miles eastward, under the shadow of the arches of the aqueduct, brings us to Molino del Hercules—the Mill of Hercules. There are two of them—the old one, nearer the town; the new, nearer the head waters of the river. The new mill is of the latest New England type, high, open, airy, well-arranged, and very costly, with all the modern improvements, and with some New England never sees. Its yard is full of daintiest flowers and fruits, with statues and fountains. The tropical sun lies warm in this spot, and the rhododendron, rose, peony, orange, lemon, and all tropical beauties glow before the doors of a common cotton factory. More striking is the old mill in this vivid contrast. It stands back from the street, near the water-course. It is inclosed on three sides with a high iron fence, light, graceful, and tipped with gilded points and balls. Inside is a spacious garden, with walks and fountains and foliage and flowers. Several gardeners daily care for the nourishment and pruning of these thirsty and wanton luxuries. Benches are scattered around. Thickets of green and natural houses are daintily grown together. Every thing is after the best type of a lordly pleasure-garden, and yet it fronts a factory where whirling spindles and looms are its constant music. Flutes and soft recorders would seem more fitting.

Why should not our Northern factories be alike embowered, at least so far as their climate will allow? If I should add that the gay young man who runs these mills drives into Queretaro with four horses drawing a stage-coach; that his workmen get only two and three reals a day; that they are required to work about sixteen hours; that there is deducted from their wages a real a week to the manufacturer's doctor, whether they are sick or well, and another real to his judge, whom they are compelled to employ to settle all disputes between him

and them; that he requires them also to take up a large portion of their little wages in goods from his stores; and lastly, that his mills, despite the poorness of the goods, the cheapness of the labor, and greatness of the price they sell for, do not pay expenses, but that he is constantly and overwhelmingly bankrupt—the Yankee mill-owner may conclude it is wiser to make his mills less romantic and his profits more sure. If he also will work his people less and pay them more, his lack of taste may be condoned. Still, if to all excellences he adds these factory gardens of Queretaro, he will find his mill the more attractive, and make of duty a delight.

The regular route northward from Queretaro is direct in two days to San Luis Potosi. I make a circuit to bring in Guanajuato and Leon, two large cities lying to the northwest. It is eighty miles to Guanajuato over a superb hard road, amidst a superb soft landscape, engirt on either side by grand ranges of hills. The day is equally beautiful with the landscape. The driver and his sole number one passenger ride together on the box. The conversation is broken, and language lame, but it is nevertheless kept up. The best way to learn a language is to talk with the drivers and waiters. They put on no airs, and are pleased with your condescension in taking the humble position of a pupil. The fields are yellow and bare, for the rain is over and gone, the harvest reaped, and the country is too extensive for general irrigation. Where it is inclosed and irrigated the fields are striped with luxuriant maguey, grandest and worst of all the herbs of the field, or soft and compact with the glossy green lucrene.

At near the centre of the way a woman under a cactus is making tortillas, and frying them for the muleteers and toiling vagrants. It is hard work to shelter herself under the straggling tree, itself looking as if it were also a Mexican greaser, ragged, leath-

AQUEDUCT OF QUERETARO.

MEXICAN MULETEER.

ery, homely, and unfortunately compelled to abstain from traveling by an impediment in its feet. Farther on, the land opens out on a broad prairie twenty to thirty miles in length and breadth. It is called the Pasture of Bulls. Here were raised the choicest bulls for the Mexican arena. They were trained as the game-cock, to fight the red flag, so that when they should see it in the amphitheatre they would rush fiercely upon it. They were pampered to kill and be killed. But when the edict was issued abolishing bull-fights, and the capital was compelled to obey it, the business fell off, and this grand pasture is relegated to common service and to a practical wilderness.

It is nigh dark as we pick our way over the hills and around the spurs that outlie the mountain-hold of Guanaxuato. We come straight, though crookedly, into the mountain, along whose sides, though miles away, we have ridden all the day. The greatest silver town of the land lies amidst those cliffs. Not a sight of it appears, nor a possibility of a sight. Where it can be, or how it can be, is among the conundrums that one can not decipher. The plains are deserted, and we begin to wriggle in and wriggle out among the tossed-up moles that edge off the tall cliffs behind them. After long preliminaries of this sort, the path narrows and deepens. It winds by the side of a river, gray with the washings of reduction haciendas. Along its side men are busy "panning out" their private spoils, the day's regular toil having ended. Still no town appears, nor probability of a town, especially one of sixty thousand inhabitants. The hills grow closer together, and appear determined to resist all human invasion. But the coachman defies the hills, rushes on across the shallow

brook, along its edge, under the threatening precipice, narrowing and narrowing, like an old lady the toe of the stocking she is knitting, till we burst all at once into the tiny alameda, or park of the city, with its lounges, rush along the narrow, lofty, twisted, crowded street, past the plaza, prettier, pettier, and livelier than the alameda, and haul up with a crunch and a jerk and a suddenness of steam brakes at the entrance of the Concordia.

The next day we ramble through the town. Its mines are farther up the mountain, but its haciendas for reducing the ore are all inside the city. There are over fifty of them, some of them quite extensive. Mr. Parkman, of Ohio, has one of the oldest and largest. He is now somewhat feeble in years, and his sons carry on his business. His house, spacious and cool, overlooks his works. The miners and owners bring their ore here. It is distributed according to its apparent value, the best masses being reduced by themselves. The ore is beaten under huge hammers, ground by mules walking round a press, in which it is reduced to powder, placed in open vats, mixed with dissolving chemicals, salt, sulphurets, and powerful solvents, and trampled by horses to get the soil and solvents well mixed together. At Regla two hundred horses march round the patio full of this silver mud. But the powerful chemicals soon injure their feet. Mr. Parkman, with his Yankee wit, provides a cheap and admirable substitute. It is simply a barrel moving along an axle. The axle stretches across the patio from the centre to the circumference. Horses outside pull it round. The barrel on the axle both revolves upon it and moves up and down it, reaching thereby all the composition, and commingling it more perfectly than horses' feet can do, yet with injury to none. It is a simple and seemingly effective remedy.

From this patio the substance is put through several waters, and the silver at last nearly extracted. It is then placed in furnaces, and by heating, the still adhering and undesired elements are driven out; and so, through fire and water, the well-sought silver is brought into a narrow compass. Even then it is ragged and unfit for working. It must be run into bars, and carried to the mint, and coined into solid dollars, halves, and quarters, for the delight and destruction of mankind. In Guanaxuato they vary this form of its ultimate disposition with those more pleasing and artistic; and horses, horsemen, muleteers, carboneros, and other native peculiarities are cast in solid silver, and sold as curiosities at comparatively low rates. In fact, silver is about all that flourishes in Guanaxuato. The people, like those of most mining towns, are reckless of money and morals. Churches are not numerous, or much adorned, or much attended.

One day at Leon shows more of piety and of poverty than a score at Guanajuato, which is full of silver and of sin.

Leon lies fifty miles to the west.

The road, after getting out of the mountains, passes over the same broad landscape, lined by the same high ranges, that accompanied us all the way from Queretaro. Leon lies against a range of low hills that cross the valley. It is the largest city next to the capital, and the poorest. The patches of gardens thicken as we approach the town, many of them given up to lettuce. This vegetable is the peculiarity of Leon. It grows into great soft heads. Its outer

leaves are stripped, leaving a delicate light green as its superficial tint. It is then pressed together, and a tulip, or rose, or some other glowing flower is put between the edges of its leaves, and thus bewitchingly arrayed, it looks totally unlike the usual sprawling lettuce-head that other markets exhibit. The market men and women of London, New York, and even Paris might well copy the taste of the brown lettuce-selling señoras of Leon.

A pretty park lies at the entrance to the town, consisting of four rows of shading trees, with benches beneath them and drives between. This is all the alameda the big city affords. It is a city of Sybaritic luxury, if the advocate and revealer of that style be an authority, the favorite clerical romancer, who declares a perfect house is only one story high. Not a dozen houses of its hundreds are two stories in height. The lordliest mansions are all of this lowly height. The plaza, full of flowers, is inclosed with shops of the same tallness. Only one side towers into twenty feet. The cathedral is not costly in its appointments, and is exceedingly dirty in its devotees. Such another ragged, lousy, beggarly set as crowded around its bishop to kiss his ring, or to witness his genuflections, one must go out of Mexico to see. And where can he go below Mexico? The church is adorned with shields of blue, whose letters of gold proclaim divine honors in many epithets to the Virgin. Refuge of Sinners, Citadel of Heaven, Altar of Refuge, Queen of

CHURCH OF SAN DIEGO, GUANAJUATO.

Heaven, Mother of God, and many such line and desecrate the temple.

It is this bishop who has lately fulminated bulls against toleration, and called upon the faithful to resist this emancipation. His people here will resist. They are low enough in ignorance, poverty, and prejudice to oppose the state, but they are too weak to overcome it.* Leon will yet be redeemed from the Virgin to her Lord and her God.

A ride on horseback among the gardens that skirt the town, with an English-born resident, showed us the richness of the soil and the industry and comparative comfort of the people. Each man owned his garden patch. They dislike to work for others. It is with difficulty hands sufficient can be secured to work the handicrafts and the haciendas in and around the city. They prefer to till their own bit of soil. This they keep fresh by perpetual irrigation. Wells are ceaselessly emptying their buckets into rivulets that run among the gardens. A river skirts the town on the north. In its shallow and rocky bed the washers are busy pounding and rinsing clothes. They put them on smooth stones, cover them with soap, dash water upon them, and pound them. They spread them on bushes to dry. Sometimes the lady herself sits in the river, wrapped about neck and shoulders in her rebosa or mantle, while her solitary skirt is drying on the bushes. That cleansed and resumed, the rebosa gets its cleansing also. No warm water or soaking in suds or long

THE VIRGIN AT SAN LUIS POTOSI.

life to garments here. All is fierce and swift to destruction.

To get from Guanajuato on the main northern route, without going back to Queretaro, required a long day on horseback across the mountains. At four "we climb the dark brow of the mighty" something, up the narrow streets and crooked of the crowded city, jammed along the sides of precipitous rocks, overhanging its huts and temples; up and up, passing carboneros and wood-carriers descending to the town with their burdens of charcoal and fagots, grievous to be borne; up and up, past a village perched on a cliff, whose church is thrust on the outermost edge, from which one could easily tumble headlong on the town below. The smoke

creeps out of an occasional chimney, the lights flicker in an occasional window, the sound of grinding is low but at times audible from the reduction haciendas. Across a gorge on a like and loftier hill-top hangs a larger town—Mineral de la Luz—a great mining centre. Far off the valley of Queretaro and Leon appears through gaps in the hills. Down we plunge two or three miles to a hot ravine. Blueberry blossoms give way to apple, and these to more tropical flowers. We skirt the bottom of the ravine, climb up again, get lost, find our way with difficulty, ride over the tepitati—a volcanic tufa that rings hollow from below, and sounds as if it would let the horse through at every step. But it bears him safely over, and might do so for centuries, doubtless, were he able to test it so long. The ride of eighty miles on horse, through every sort of desolate and possible scenery, brings us at last to the high-road, and the next day we reach San Luis Potosi.

This town is centrally situated. It is four days, or about two hundred miles, from Mexico. It looks very lively as you enter, its steeples rising from a green sea of the pepper or Peru tree, which is the favorite tree of the country. It has light willowy-looking leaves, and grows to the height of a cherry-tree. Its red berries hang all over it in bunches that look very tasteful, and are very tasteful too, but not of such taste as is agreeable to human palates. They are not unlike an unripe persimmon, and pucker your mouth into contortions, while they bite and sting as if their red was fire. The birds like them, probably because they have no palate. The tree grows every where on the lightest and rockiest soil, but in these

meadows about San Luis Potosi attains its tallest height and richest color of leaf and berry.

High hills inclose the long valley on every side, and several villages dot it. The hills are argentiferous, and some of them are very well worked.

Like all Mexican towns, it is less lovely near at hand than afar off. Its square, however, is respectable, and the walk that leads to the Church of the Virgin more attractive than the church itself. The cathedral is not overgrand, the alameda cheap and dusty, and the old arena for the bull-fights is toppling down, though Sundays and feast-days are still sacredly devoted to these forbidden performances.

The people are very superstitious. They have a rural Virgin, whose shrine is two miles from the city, and whom they worship exceedingly. When they wish for rain, they take her on a visit to another image, of Joseph and the Babe. This time the father carries the son. Here she spends a few days, and then Joseph is taken to her chapel. But though these processions and prayers had been very numerous and ardent the past year, and had also been arranged just at the commencement of the rainy season, when their prayers would seemingly of necessity be granted, still for almost twenty months scarcely a drop of rain had fallen. The images had been carried and worshiped in vain.

On leaving San Luis Potosi you swing out into the wilderness. It is four days to Saltillo, days of weary pulling through heavy soil, or over the rocky divides that separate the natural parks from each other. The scenery is monotonous for that two hundred and fifty miles, and the towns are very few. It is simply a succession of valleys ten to twenty miles long and three to eight miles wide. These valleys are lined with hills from six hundred to sixteen hundred feet high, well stocked with silver. Even their color is of the silver-gray that reveals their contents. No trees are on them; nature and the natives have stripped them as bare as are those of Italy, and as soon will be those of Pennsylvania. They are occasionally mined, but the process is too costly except for capital, and that requires a safer government before it will invest itself here.

The valleys are filled with the cactus, Peru-tree, and mesquite. The former is the most numerous nearest Mexico, the second in the midland country, and the last as you draw northward. The cactus has two varieties. The organ cactus, which is used for fencing, grows very compact, and sometimes quite tall, and is the best natural fence I ever saw. It takes up no room, as hedges usually do, and is as difficult to penetrate and as easily repaired. It is rightly named, for it looks like a vegetable organ. The picture on the next page gives it more open than it usually grows, but is otherwise a fine representation of its symmetrical comeliness.

More frequently the other sort of cactus appears—the lapstone kind. This is called *napoli*, and orchards of it are often met with in the upper country. It is a most ungainly shrub—the Caliban of the field. Its trunk is covered with warts, and is crookeder than

JOSEPH AND THE BABE AT SAN LUIS POTOSI.

the apple or the olive. Its hard, homely leaf is equally knobby. Spines thrust their jagged points from every edge and wart. Its little pale yellow flower looks ridiculously funny perched on this leathery leaf, like a delicate fading young beauty joined to a hard and hideous old salt—Florence Dombey and Captain Cuttle. Yet this cactus, like many a rough old man, is one of the most genial and useful creatures. Its fruit is the food of the people, and it is otherwise valuable.

You will see the natives half sheltering themselves under its shade, the men idly smoking or playing games, the women ceaselessly rolling out the tortilla, or frying it on the iron plate that sits over their bit of a fire.

THE ORGAN CACTUS.

Tortilla-making is a very simple but not very easy business. Housekeeping furniture consists of a mat, a skillet, and a smooth inclined stone about two feet long. On this stone they place a mass of softened corn, made pulpy by previous soaking in alkali,

and then the woman proceeds to roll it out down the stone until she has made it a soft smooth sheet, which rolls itself off in crumbles at the bottom of the stone. This she takes up in small handfuls, pats it into a cake, puts it on the iron plate over the fire, and cooks it. This is the tortilla, not ground but pounded corn, without any addition save what the soaking and the patting and the frying afford. It is not disagreeable eating, even when wrapped in the chile, the hot Cayenne-peppery substance which imparts the needed pungency to the cake.

As we approach Saltillo we pass through the battle-field of Buena Vista. It takes this name from an hacienda which is at the northern or American edge of the field. The field itself is hardly worthy of that name. It is simply a gorge between very

CACTUS, AND WOMAN KNEADING TORTILLAS.

high hills. The pass is hardly two miles wide, and even this is broken up by a river-bed twenty feet deep, and at the spring season almost utterly dry. On the eastern edge of this pass is a moraine, fifty feet high, and projecting a third of the way across the pass. Here the Americans located their cannon, and drove back the Mexican forces, who had ranged themselves across the head of the pass to dispute the passage of our troops. It was the best place to make that stand between Saltillo and San Luis Potosi. They were scattered by our guns and the rush of our men, and the fall of the country was settled from that battle. There was not the least need of the sending out of Scott, and the march up the sierras of Orizaba, and the fighting round the capital. Taylor could have marched unobstructed to within sight of the capital after the battle of Buena Vista, had he been properly reinforced. But political cabals ordered another and a bloodier course.

Saltillo lies at the head of a rich, long valley, which is girt by a superb amphitheatre of hills. It is lower than the highlands of Buena Vista, and is so snugly packed against the upper edge of the valley and under the hill that you do not see it before you look down upon it from the top of the ashy bluff that backs the town. It has no attraction but its alameda, which is the prettiest I saw any where. This was surrounded with a hedge of roses. A river ran on one side. Trees full of leaf and flower shaded its drives. But the town itself seemed tired out. Its one-story white-washed houses were without life. Despite the pleasure of meeting two Americans there, it was not disagreeable to mount the coach and run through the open country down hill to Monterey. It is about twelve hours from Saltillo to Monterey, probably twice that from Monterey to Saltillo. In that twelve hours you descend over three thousand feet.

The mountains close you in soon after you cross the plain, an hour or two out of the town. They grow higher and closer every mile, until they are hardly a mile apart, and not less than half a mile in height. The most lovely flowers from various species of cactus line the rocky road-side; and even at risk of the coach starting on a run, I open its door and step out as it is walking up the

hill, and pick the brilliant crimsons, pinks, and purples.

The hills grow taller as we get nearer their bases, but the valley becomes broad and level enough to be arable, though still very narrow and uneven. A curious hole in that high brown mountain wall, a thousand feet above you, looks no bigger than a hat, but is bigger than a load of hay. It is a natural hole through the thin-edged sierra. Just before you a turn in the road discloses Saddle Mountain, so named for its resemblance to a Mexican saddle. Underneath it is snugly and hotly packed the city of Monterey.

This is a far more romantic town than Saltillo or San Luis Potosi. It is more so in some respects than any other city, for its mountains are very tall and grand, and its tropical surroundings very rich. Yet it has no buildings of the least attraction. Its churches are poor, and its buildings paltry. At the western entrance a knob rises rough and rocky from the evergreen gardens. On it is an abandoned palace of the bishop. Around that ruin raged one of our fiercest battles, and with its fall Lower Mexico became ours. Here Lieutenant Grant won his first brevet, but declined to receive it because a like honor was conferred on a fellow-soldier who he did not believe deserved it. If he was courageous, then Grant was sure that he was not. A second brevet before Mexico showed that he was growing away from his unworthy rival. In the centre of the town is a remarkable fountain, pouring forth a volume of delicious water. The Eye of the Town, it is called, whereof, it is said, if one drink he never can leave the city. It is certainly a sylvan spot, capable of being made a graceful centre of the town, instead of being left, as now, to the water-carriers and washer-women.

The alameda is less lovely than that of Saltillo, but being the last, has more regard than it deserves. It is not disagreeable, and is a far better park than most of the cities of

SADDLE MOUNTAIN, MONTEREY.

THE BISHOP'S PALACE, MONTEREY.

America possess. The Mexican plaza and alameda, as centres of business and pleasure, surpass our squares and parks, except when the latter are gotten up by big cities in big style. This pretty bit of shaded walks and drives—where can you equal it in our minor cities?

Not less delicious are the gardens that lie about the town, with their rich tropical foliage, palms, pomegranates, and densest verdure—life pressed to its overwhelming fullness.

The last ride is the worst, as to horses and mules, in roads and in ranches. For three days and two nights we waded through the deep loose black soil, half the bed of the sea and half the bed of the river. Chaparral covers much of the country with its impenetrable thickets. It is evidently a terrible abattis for an army to overcome, but ours waded through it. *Sans culottes* were they on emerging from the thorny thickets.

The mountains leave us, and after two days' disagreeable staging we strike the Rio Grande at Camargo. This ditch, as our covetous kinsmen of Texas call it, is not wide enough to keep the Mexican cattle-stealers off our territory, or our troops off theirs. It has one excellence. It shows we are near our own flag and land. A beefsteak and a double bed are across that "ditch," luxuries never seen on this side that Styx. So we pull cheerfully down its southern side, slowly, slowly, almost all that night and all the next day, and till four the following morning, when the low plains of Matamoras bewilder us with many a mock mountain, moat, and forest, all that night long, till after much turmoil the coach-office is reached, where I meet my first and last swindler in silver. Perhaps he had lived so near the border that he had caught the habits of the Yankees. At any rate he sought to palm off

smooth and chipped silver for the remnant of the bill of credit. Pistareens hardly worth a Yankee shilling, and quarters without sign of mint, and other such corrupted coin, he sought to "shove" as of the value of fresh quarters. The dollars were less smooth, but still much deteriorated. So making a virtue of his vice, in a hurry to catch a coach for Corpus Christi, the coin is angrily snatched, the river is crossed, and

Brownsville welcomes us home. The twelve hundred miles are safely passed, and Mexico and Matamoras are tied permanently together. The city is after the usual sort, low-roofed, white-walled, dark, dirty, and cool. It gives traces of its American connections in its trade and in broader avenues. The river is of fair width. The American side is the more bustling, and, like all new towns, is sure something is going to make it rich and great to-morrow.

BEN SADI'S QUEST.

(AFTER GITTERMANN).

BEN SADI wandered many a weary year,
From youth to age, in search of Happiness.
In the king's house dwelt Pride and Show and Fear,
And in the poor man's hovel gaunt Distress.
And, turning from the hovel and the throne,
Where should he wander? In what distant zone
The secret Goddess find? The bitter pain
Of disappointment soured Ben Sadi's mind,
Filled him with sullen temper and disdain,
And unbelief in what he could not find.

It chanced, one day, he wandered through a wood,
Dark and forbidding, like his own ill mood,
When suddenly, between the tangled boughs,
He saw a hoary temple, ages old,
Where earth's first children went to pay their vows.
Thick ivy clung in many a sombre fold
Around its columns, and its silent door,
Through which the winds had passed for centuries.
Ben Sadi trod its damp, unechoing floor,
And, fearing wizard-work, was ill at ease;
But, looking round, a little door he spied,
Standing half open, at the farther side,
And just above the door these words were writ:

*Here fall no tears, here all are blest;
Enter to Happiness, and rest.*

With joy he wept, though scarce believing it.
"O blessed hour," he cried, "that ends my pain!
Ye weary, wandering years, not spent in vain!"
He pushed the door; it opened with all ease,
And peering in, and seeing by degrees,
He saw—

The temple still its secret keeps,
And there, in perfect peace, Ben Sadi sleeps.

S. S. C.

ON THE BOUNDARY LINE.

THE BOUNDARY LINE.

I.—SPURS OF THE GREEN MOUNTAINS.

THE few who have toiled up the steep acclivity and have stood upon the plateau-crowned summit of "the Mountain" which overlooks Montreal from the west have felt that the view, however enjoyable, is unsatisfactory because it is incomplete. There is no prospect beyond the Mountain toward the interior, and in other directions the horizon is visible only as infrequent openings in the underbrush give access to the edge of the cliff. But soon the terraces of the new Mountain Park will furnish an easy drive to the summit, and will give additional enjoyment as the entire horizon is gradually unfolded to the eye. At present we can look down hundreds of feet upon the city itself, stretching for miles to the north and south, and extending eastward from the Mountain to where the broad and beautiful St. Lawrence is spanned by the wonderful Victoria Bridge. There it lies in a sort of quiet dignity and repose, at the head of ocean navigation and at the foot of a long system of canals, just where the bulk of all water-carried merchandise must be broken, and old Ocean hands over his burdens to the inland fresh-water seas. The successive terraces toward the river give prominence in the foreground to the light gray limestone of the modern city, while by this foreshortening the existence

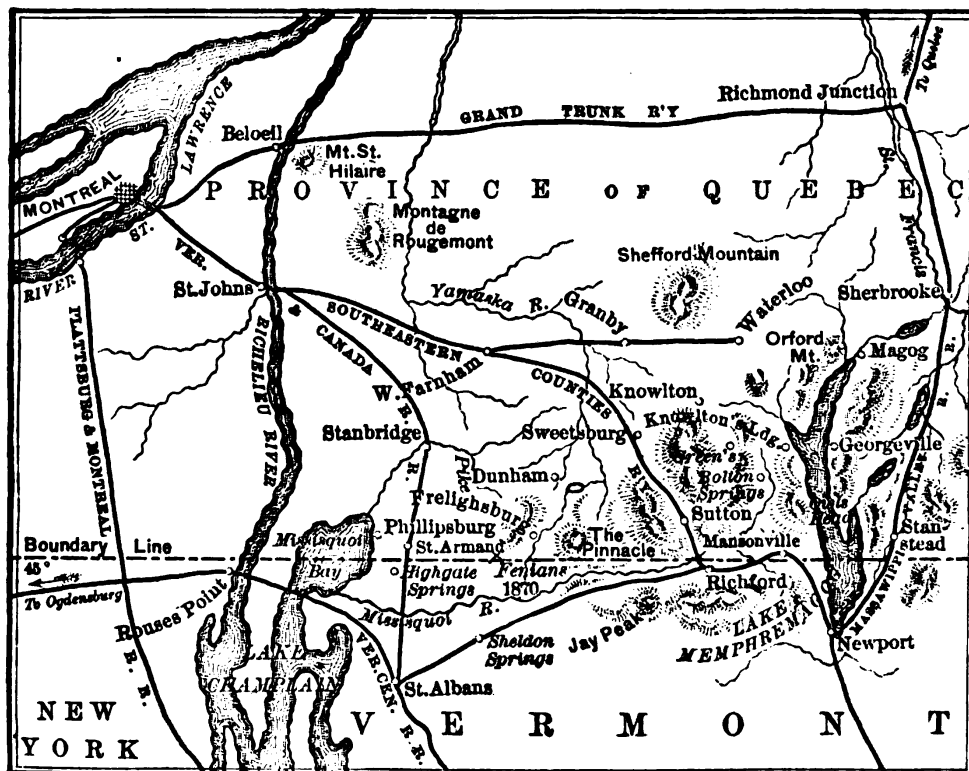

of older buildings near the water's edge is revealed only by flashes of light from their bright tin roofs. As we contrast the two cities of one name, yet of different centuries and nationalities, we call up visions of those early days—of Champlain, Frontenac, Beaucharnois, and Du Quesne. Our eyes wander over the same prospect that they often enjoyed, the same in outline, but how different in detail! In the haze of a beautiful September morning we look past the sparkling rapids of Lachine up to the placid waters of Lake St. Louis; then, in the other direction, we follow the stream until its identity and our vision are both lost in the broad expanse of Lake St. Peter. On the eastern horizon appear the Notre Dame Mountains—a chain which commences at the Gaspé peninsula (mouth of the St. Louis) with elevations of 4000 feet, and, with diminishing altitude, extends westward to a point whence a spur branches southward to the White Mountains. The main range, with a southern deflection, after passing Lake Memphremagog on the western shore, broadens as it rises to the dignity of the Green Mountains, and so forms a part of the great Alleghany system. Our view, however, extends only to the higher peaks of the Green Mountains, which form the water-shed between the Atlantic and St. Lawrence slopes, Mount Mansfield being the limit. Now as the northern

part of Vermont and the intervening country is all drained toward us, you can see at once how magnificent must be our view in that direction. The plain, which for five hundred miles has for its border the southern bank of the St. Lawrence, has at this point a breadth of forty miles to the southeast. This prairie-like surface is unbroken, save where the masses of Shefford Mountain, Rougemont, Boucherville, Chambly, Yamaska, and Belœil have been thrown up by the convulsions of nature. Geologists affirm that all these isolated greenstone peaks (Montreal Mountain included) are thus prominent because in resisting the elements they have been more successful than the softer strata by which they were formerly surrounded. Whatever their history, there they stand, with a general east and west direction, just as the bows of huge ships all point to the interior of the harbor when the ebbing tide leaves them stranded upon the beach.

We are looking up and across the valleys of the Yamaska and Richelieu, whose courses through the plain are singularly parallel, and only twelve miles apart. Beyond the Yamaska water-shed we see the valleys of the Pike and Missisquoi, which drain both sides of the boundary line, and empty into Lake Champlain. Here are the spurs of the Green Mountains which form the southern boundary of the tract we are to describe. That tract is limited on the east by the lofty peaks

upon the western shore of Lake Memphremagog, which hide that basin and the valley of the St. Francis from our view. The nearest of the isolated peaks above mentioned is Belœil, rising 1200 feet abruptly from the eastern shore of the river Richelieu (outlet of Lake Champlain), which connects the St. Lawrence with the Hudson. On the roadway to the summit of this mountain there were formerly fourteen wooden crosses, each bearing an inscription concerning our Saviour's journey to the place of crucifixion. These the elements have destroyed; but years ago, during a visit from the Bishop of Nancy, a small chapel was erected and riveted to the solid rock. Although the lofty cross upon its top was long since blown down, the tin roof still reflects the sun from a distance of twenty-one miles.

After crossing the Victoria Bridge we frequently read from the car window the sign, "*Traverse de chemin de fer*," and we realize that we are in the "French country." We become interested in the oddly built houses, and in the long lines of fences, only a few rods apart, yet parallel and stretching far out of sight. We had noticed the same curious features as we passed down the rapids to Montreal. During the occupation of this country by the French those who had been of service in war were rewarded by the French government with grants of land bordering on the St. Lawrence or its larger tributaries. These grants were termed *seigniories*, and

MAP OF THE REGION BETWEEN MONTREAL AND LAKE MEMPHREMAGOG.

FRENCH CANADIAN HOUSE.

within their limits all property, real or personal, was affected by the *Coutume de Paris* of 1666. The *seigneurs* (or grantees) held in feudal tenure, and to them were owing money and service from the *censitaires*. In 1855 the law of tenure was done away with, and even realty ceased to be affected by the act above noticed. The original *seigniories* contained from one hundred to five hundred square miles; the frontage (upon some stream) was narrow, but the depth was great, the proportion being as one to ten. On the death of the father the land was divided longitudinally, the eldest son taking the largest share and the younger sons taking *fiefs*. When roads were opened in the interior, latitudinal divisions were also made. But successive generations thus dividing the paternal acres, and settling down at home, have so reduced the size of the farms that the land is "all longitude," the frontage often being thirty-three and a half feet and the depth two thousand feet, or as one to sixty. This causes the rows of old houses to have the appearance of a village street.

But what can we say of the farms? The poor soil is exhausted, and the whole French Country is overstocked with wretched and shiftless *habitants*. Thousands of them travel many miles to help the Vermont farmers,

FRENCH CANADIAN CART.

Vol. XLIX.—No. 291.—23

or to work in the brick-yards of New England. The summer over, they return with almost the only money they ever see, and which is too often all exhausted before they reach home. Their cabins are of squared logs, the chinks filled with mortar; the gables are of sawed boards, and the roofs are of tin or wood. The open summer kitchen is exposed to every storm. Close by the adjoining corn-crib, and making a ladder for the rats, stands the ponderous cart, with wooden axles and double springs of the same material. Within call is the small-bodied but large-limbed "French horse," originally from Normandy, and as his master drives him he will first deal a blow, and then you will hear, "Avaunt! Ah! pauvre cheval! vous avez un bon maître!" The shaggy brown and white dog, unlike any other of his species, also appears. It is well that these animals can subsist on little, and that little of the coarsest kind; for their masters have nothing more or better to give them. Besides onions and potatoes, pease form the chief diet; and so common is this staple that "pea-soup" is used derisively as an adjective or noun. Poultry and salt pork are the more substantial dishes, and the only meats on their bill

A HABITANT.

of fare. Yet they have one luxury—the *boudin*, or "blood-pudding," as the English call it. A fine pig is selected, the throat cut, and the blood allowed to drip into a pan; an old woman adds flour and other things, as experience suggests, and stirs the whole until it becomes cold. This delightful compound is then baked, and those who have eaten of it say that it is excellent.

Tobacco is not a luxury but a necessity with these people. After raising and curing it they twist it into rolls like a Bologna sausage, and smoke the strong and filthy stuff in short clay pipes.

In person the *habitants* are small, and have the regular features of the French. If any beards are worn, they very thinly cover the face. Upon their heads are hats with narrow brims or caps without visors. Their clothing is of coarse woolen stuff, called "French gray." In cold weather several

pairs of stockings cover their feet, which are then thrust into moccasins, or immense boots without heels, secured by a strap over the instep. For merely wet weather, or for standing on the ice, wooden shoes (*sabots*) are used. In personal habits cleanliness seems to be unknown. Small-pox prevails to an alarming extent. The language they speak does not arise to the dignity of a *patois*. Even when French is spoken entirely, it has the English construction and idioms. They are poor, but seem to be happy, especially in the enjoyment of their numerous holidays,* the number of which they ever strive to increase. On saints' days processions are formed, and all lookers-on are expected to uncover the head and kneel as they pass with banners and images. A young man known to us was tarred and feathered because he was so unfortunate as to be caught by a procession while bathing. His hiding under the bridge did not save him from the consequences of a fancied insult.

As we watched the swarthy youths slipping their beads at the mass, and then leaving for scenes of carousal, we could not wholly blame those who never knew any thing better. It may be that superstition makes strangely wild and sweet the tones of their weird incantations as they drive the evil spirits away on returning home at night-fall. Perhaps their childish fancy can not go beyond their peculiar game of checkers—144 squares, and thirty men on a side.

Meanwhile our train has passed through the French Country, and stops at St. Armand station. We are within a mile of the boundary line, upon ground made historic by the contests of the last century, the war of 1812, the rebellion, and the St. Alban's raid of 1864.

Just within the borders of Vermont is Highgate, the birth-place of John G. Saxe. There stands the old mill where once was "Little Jerry, the miller," but the "wasting wood and crumbling stone" have been wasting and crumbling ever since, the flume, of hollowed logs, is past all usefulness, and the "dripping and clattering wheel" is forever still.

A few miles to the east is Eccles Hill, where in 1870 the Fenians made a second and last attempt to invade Canada. From the upper window of the last house in Vermont their gallant leader, General O'Neil, thus called upon his command to march forward: "There before you is the way to Ireland's glory. You do not need me to lead you on. Go over, and—" Assisted by the owner of the house, exit O'Neil, singing,

"Perhaps it was well to dissemble your love,
But—why did you kick me down stairs?"

* The legal holidays in the Province of Quebec are New-Year's, Epiphany, Ash-Wednesday, Annunciation, Good-Friday, Easter-Monday, Ascension, the Queen's birthday, Corpus Christi, SS. Peter and Paul, Dominion-day, All-Saints, Conception, and Christmas.

The United States marshal then took him in charge, and the few raiders who crossed the line were soon driven back by a well-drilled militia, whose exploits have ever since served to enliven the annual muster upon "Dominion-day."

Two miles north of the line is Pigeon Hill, and a little to the east, nestled among the hills, is Frelighsburg. Both of these places were held by the Fenians during their first invasion in 1866. Their reign of terror lasted only three days, and in their flight many relics were left in the hands of the enemy.

We find ourselves now actually among the spurs of the Green Mountains. With the plains we have left also the *habitants*; we have risen above them physically and socially. The towns among these hills of the "Southeastern Counties" are for the most part English. In fact, within this Province most of that nationality are found to the south of an imaginary line drawn from Misisquoi Bay toward Quebec. The reason is evident. When the boundary line was determined only one-third of the original parish of St. Armand remained in Canada. Most of the inhabitants of this tract moved over the line rather than live in the United States. They found there the United Empire Loyalists, who, for similar reasons, had crossed the border after the Revolution. For the relief of these actual settlers "warrants of survey" were issued by the crown, and most of the towns were settled by the year 1815. In those early days the only transportation was by water, after the manner of the *voyageurs* and *courriers des bois* of the St. Lawrence. The only roads were those over the snow in winter, and even these did not keep the energetic Lorenzo Dow from sharing hardships with the rest. In the Legislature the French were not disposed to allow any representation from this rapidly growing section. Finally, in 1829, they yielded so much as to give eight members to the eastern townships, which were thenceforth collected into the "Southeastern Counties," so named to distinguish them from the western counties of Upper Canada. Subdivisions of the French Country still retain the names "seigniory," "parish," etc.

Frelighsburg is the largest town within two or three miles of the border. Roads passing through it lead in six different directions; yet it is impossible to avoid a certain corner where stands a stone hotel. Here is the office of the genial consular agent of the United States. Within the office fishermen's articles abound, while from the walls depend relics of the hunt and snow-shoe tramp. Through the deeply cased windows we look out upon either of the two roads leading to the States. The writer recalls his first visit to this place, only a few days after the death of a former consular agent.

UNITED STATES CONSUL'S OFFICE.

All the village was after the office. So one half were glad to see him, supposing him to have the power of appointing a successor, while the other half suspected that he was a candidate for the vacant place. At that time the present consul had not received his appointment, and was more at liberty to join in recreations with the writer. We fished with ill success in various ponds, and laid the blame to the boats we used. We therefore built one, despite the jeers of the villagers, who sneered at our incompetency, and yet were glad enough to go with us when *The Ripple* had proved a success. This boat was trundled about from one pond to another upon a cart fastened to the rear axle of our buggy, and in this manner we occasionally had something to show after a day's fishing. Most of the time, however, we had only "fisherman's luck"—our hooks would not tempt—and then we called it boating.

Our trout-fishing, although not so frequent, was more satisfactory. Shielded by our wagon umbrella (for the rough roads will not allow buggy-tops), we drove to the foot of "The Pinnacle." One brook in particular was well stocked with trout; but at night we never knew whether or no we should pay duty on the fish, as the brook runs alternately on either side of the boundary line. This line is marked once in a mile and at every road crossing by a small iron monument, and through the woods there is a clearing a rod wide. This parallel of 45° is marked through the fields by a substantial fence, upon which we would often pause while climbing, sing patriotic songs, and try

to find the exact half-way mark from the equator to the pole. Our workshop was an old mill (now re-opened), where we heard of a certain miller from this part who had been elected to the Provincial Legislature. Seeking to better the condition of his craft, he declared that the miller's toll (one-tenth) was so small that no one could manage to live upon it. He therefore proposed a law—which remains to this day—making the toll one-twelfth!

The trade of all this section has decreased amazingly since duties have been reduced in the United States, and the merchants sigh for the good old days of "the war," and the familiar presence of the bounty-jumpers.

The old houses have an air of dignity and comfort which breathes of better days. But now there is no ambition, no desire for improvement, no taste for reading. Few books are visible; the daily news concerning their own country interests them little, and of the great world outside they know nothing. Drunken brawls and bar-room loafing fill the streets with neglected children; and so one generation of illiterate, unkempt idlers succeeds another.

Old Trinity Church is the most interesting building in Frelighsburg. It was erected in 1809, and, next to the cathedral at Quebec, is the oldest Church of England edifice in the Province. Notices of sale are still posted upon the doors of this parish church—out of the way of all publicity during the week. Even upon the Sabbath very few climb the hill to hear the eloquent rector or to assist in the usual village gossip.

To a stranger the interior is full of interest. The high square pews, placed at every angle to the pulpit; the long lines of stove-pipe, relieved by occasional tin pails to catch the pyroligneous acid; the huge stoves, one at the rear, the other in a widening of the broad aisle; the wood-pile, occupying three pews not in use; and the old windows of seven by nine glass—these, together with the modern organ and chandelier, all show that a New England meeting-house can be adapted to the needs of the Church of England. The doors have been removed from pews which are considered free; otherwise the room is unchanged since the venerable Bishop Stewart became the first rector of this parish. We have often peered over the back of the pew in front of us, and looked up and around at the interior; nor could we ever decide what name to call it, for the architecture is of a kind all its own. And while we were musing the ringing of the small, sweet-toned bell would shake us back again to consciousness.

Southward from Dunham and Frelighsburg, close upon the line, is the highest peak among these hills. "The Pinnacle" lies where three water-sheds meet—the Pike to the west, the Missisquoi to the east, and the Yamaska to the north. From the summit, as a central point, we can best obtain a general view of the country we have already passed through, and of the small portion yet unexplored by us. The Green Mountain spurs are at our feet on all sides, and the Green Mountains themselves rise higher and higher toward the south, until they form a horizon beyond which all water runs away from us. Lake Champlain (fifteen miles distant) seems but a step, and back of it are the Adirondacks, with Mount Marcy towering over

ENGLISH CHURCH, FRELIHSGBURG.

INTERIOR OF ENGLISH CHURCH.

all. The White Mountains show us the summits of Washington and Lafayette. To the east are the lofty peaks which line the Memphremagog basin, and hide that lake from our view, while over their heads the confines of the St. Francis Valley bound the horizon. We look up the long Missisquoi Valley where we are yet to go, then down, in all directions, into the numerous ponds which receive the purest spring water in the land; and we soon realize that all these towns have immense water-power for the manufacture of lumber, woolen goods, and paper. Just at the foot of the hills, and bordering on the French seigniories, lies Stanbridge; beyond is West Farnham, with sixty feet fall of water within its limits. Still farther on are the extensive peat beds and low miasmatic country which make St. Johns so unhealthy a place for residence. Montreal Mountain is plainly visible, and if the day is clear the city itself can be seen at a distance of fifty miles. Those isolated mountains of the French Country appear even more majestic than when we first saw them; for now instead of other mountains they have the plain itself for a background. In fact, our range of vision is much more extended, for we are a thousand feet higher than Montreal Mountain. On descending we pass by Dunham Pond, and at length reach the village of that name. Here and at other points you will notice the cheese factories. Their products are largely exported, and, with Upper Canada bacon, form the ballast of out-going steamers; on the return voyage their place is supplied with coal for blacksmiths' use in this region. To the eastward of Dunham is Sweetsburg; here we cross the Southeastern Counties Railway as it winds among the hills toward Newport, Vermont.

We pass through Knowlton, and in the hills beyond we see mines of iron, copper, slate, soap-stone, chromium, and antimony. None of them is worked on a large scale, and

many of them have been abandoned. Some miles northward are the most profitable copper mines in the Province. These "Huntington Mines" are worked on a very large scale, and their product is shipped to Boston. From Knowlton to South Bolton extends a wilderness. Small bears have been seen, foxes are often killed, and the trout brooks yield up their treasures. Without any notice storms come upon us over the hills, which never allow the horizon to drop below 45°. This wild road is almost the only one over which smuggling is successfully carried on, the rest of the border being more closely watched. Imagine a hotel located here, a large New England house, with two-story verandas extending across the front and ends! In true Canadian style, stoves in the partitions heat two rooms at once; the long pipes heat the rooms above, and extend through floors and ceilings regardless of length or displacement of furniture. This is the fashionable watering-place known as "Sol Green's." "The Springs" are two miles off in the Missisquoi Valley, and near the pass which breaks through the Bolton Mountains, and gives access to Lake Memphremagog.

MISSISQUOI VALLEY AND PASS IN THE BOLTON MOUNTAINS.

II.—LAKE MEMPHREMACOG.

The range of Notre Dame Mountains, which commences at the mouth of the St. Lawrence, follows the southern bank of that river at a distance of from twenty to fifty miles, and after forming the western boundary between the State of Maine and the Province of Quebec, loses itself among the "White Hills" of New Hampshire. A considerable part of the original range, however, makes a detour to the west and south before entering the States, and forms a part of the great Alleghany range, the Green Mountains being the connecting link. Still farther to the east there lies a tract of country bounded east and west by the separate ranges above noted, and extending north to where they meet, thus forming a triangle, each side of which is fifty miles in length. The lofty ridge upon the western shore of Lake Memphremagog is the boundary in that direction, and separates the two parts of the "South-eastern Counties." The basin of the lake and the valleys of the Massawippi and St. Francis are now under consideration. The

MAP OF LAKE MEMPHREMAGOG.

confluence of these rivers is at Lenoxville, where they bound the valuable property of the "Bishop's College." Coming from exactly opposite directions, they form at a right angle (like the letter T) the enlarged St. Francis, which flows to the northwest until it reaches the St. Lawrence.

The Grand Trunk Railway crosses the broad plains from both Montreal and Quebec. The junction is at Richmond, whence the road ascends the valley of the St. Francis and a tributary until the line is reached, and

then proceeds through the Connecticut and Androscoggin valleys to Portland.

In the early part of this century a shorter road than had before existed was opened toward Boston from Quebec. It was called "Craig's Road," and was opened by the military authorities along the Upper St. Francis Valley, thence across and down the thickly wooded banks of the Chaudiere, past its picturesque islands and sparkling rapids, to its mouth near Quebec. The source of this river is Lake Megantic, close upon the borders of Maine, where the St. Francis Indians still inhabit the wilderness. The various smaller tributaries of these larger streams generally rise in some highland lake, and furnish abundant water-power before they reach the plain. The Mas-sawippi River also rises in a lake of that name, which, although only nine miles in length, yields a greater variety of fish than any other lake in this region. But the finest stream for fly-fishing is the Magog River, which in its brief course of seventeen miles falls hundreds of feet, and empties into the St. Francis at Sherbrooke, thus giving unlimited water-power to that "metropolis of the eastern townships," which has a population of 4500. By special act this stream is closed to fishermen from June 25 to October 15, but romantic scenery and frequent rapids furnish admirable studies for the æsthetic tourist. The tramp becomes doubly interesting by the addition of a fishing-rod, for, in a region abounding in surprises and deep trout holes, this stream excels all others. A widening of the river at the middle part of its course is dignified with the name of Little Magog Lake, and here trout of five pounds are frequently taken.

As the Magog River is the finest in all this part, so its source, being correspondingly beautiful, is called the "Geneva of Canada." The Indians called it *Mem-plov-bouque* ("Beautiful Water"), but we know it as Lake Memphremagog. The scenery of this lake

"THE RIPPLE."

"TUCK'S."

had often been described to us as only excelled by that of Lake George.

Our cruise extended into every cove, and made the shores as familiar to us as to the natives. An enlarged duck boat of our own manufacture was our constant companion. *The Ripple* had been used on various ponds in the interior west of the lake before she was trundled on a cart to Knowlton Landing, and plunged into the bright waters of Sargeant's Bay. The sides of this boat were of thin ash; the bottom was flat, and the ends and sides were so protected by a deck that a small sail could be used. A vermilion edge, dividing the gray exterior from the white interior, brightened the effect of the whole. Passengers (never more than four) were so disposed upon movable benches as to best trim the boat, while, thanks to good workmanship and plenty of white-lead, no leak was possible.

In this manner we combined both pleasure and instruction, being content with two meals a day, and welcoming exposure to all kinds of weather.

We had just dined on trout, at Tuck's Hotel, Knowlton Landing. Tuck is a very useful member of society. He is hotel-keeper, store-keeper, postmaster, and her Majesty's customs preventive officer all in one, and his little corner room at the brick hotel is a curiosity shop. Over the small cupboard door which secures the three bottles comprising the bar is a card with this illustrated rebus, "I am as dry as a fish." The stranger who reads this aloud is at once asked by those present, "Then why don't you treat?" At the other end of the shelving a space corresponding to the bar is used for the post-office. There are six pigeon-holes, only two of which are in use. The mail from the interior is brought by "Old Coons" in his buggy, and a boy crosses the lake with the mail from the east. The boy stops to fish, and "Old Coons" stops to talk; they intend an exchange, and sometimes they effect it, but this daily service is not reliable. What are three or four letters daily to the pleasure or profit of the mail carriers?

GIBRALTAR POINT, FROM BELMERE.

Let the reader now carefully look at the map on page 342. At the left is a fine view up Sargeant's Bay, where the trolling line will furnish many a fine string of pickerel. In fact, it is worth while to let the spoon play almost any where in these waters. Directly in front of us is the promontory known as Gibraltar. Heavy underbrush covers the steep sides, and the summit is guarded by a blackberry thicket six feet high. A scramble through all this is well repaid by a comprehensive view of the lake. From this point we cross diagonally toward Georgeville. The professional fishermen on our way thither declare that they have "poor luck." Did ever fishermen give any other reply? Let us try our hand. We can not use the ordinary hooks and lines; we must take the heavy hook made only by the blacksmiths hereabouts, and let down 100 feet or more of line. We must also keep angling with the bait, and even then old fishermen find it an advantage at times to change the same, so dainty a fish is the muskallonge. But his fine flavor when served

is ample compensation for the difficulty of capturing him. The Indians had left these shores long before the whites came. The earlier settlers would have starved had it not been for the plentiful supply of these "lunge," which could then be caught all along the shore. Now they are seldom caught away from the deep holes in this central part of the lake. Their average weight is perhaps four pounds, but sometimes one of ten times that weight is taken.

We will now cross to the hamlet of Georgeville, and thence drive to the "Model Farm-house," situated (indefinitely) upon the eastern shore. The Model Farm-house affords delicious coffee, real cream, beautiful bread, fine meats, and fresh vegetables. "This is very exceptional," you will say. Of course it is, and so

the exact location shall not be revealed, else, by engaging the place first, you might deprive us of another summer's enjoyment. By all means let us again have the benefit of the grand view from our windows. Almost directly opposite the outline of the lofty Elephantis gives rise to its name. Our boat is kept in the cove just at hand. Beyond, to the left, a long tongue of land projects, generally known as Allan's Point. The hundred acres of its surface have been finely improved, and the whole forms "Belmere," the summer residence of Sir Hugh Allan, of the Canadian Pacific Railway. Just over the Point is Molson's Island; and overshadowing all, yet in the distance, is the Owl's Head. This mountain rises abruptly 2500 feet, and is the grandest of all the objects of interest which line these shores.

So precipitous are the sides of this mountain that it seems as if one could step directly into the lake, or at any rate hurl a stone, and thereby disturb the placid surface which lies 700 feet above the sea. From the village

of Magog to Newport, in Vermont (thirty miles), almost every square rod of the lake is in sight. Large islands are merely rafts, steamers are toy-boats, occupants of fishing boats are scarcely perceptible without a glass. Luncheon over, we sit down among the huge boulders on this height, and study the symbols of Masonry which are painted upon their smoother sides; for here is held an annual communication by the Golden

Rule Lodge of Stanstead on the Queen's birthday, May 24; guards are so placed that intrusion is impossible. We hear the happy voices of another party of adventurers. They are from Montreal, and come

"MODEL FARM-HOUSE."

laden with pocket barometers and the like, thus throwing our rustic party entirely in the shade.

The path down the mountain ends at the Mountain House, a summer resort. Here is

also a landing for the steamer, and a little to the north is Blue Point, a spur of the mountain. Between these two points lies a cove with a beach of sand and shingle. Here are boats for crossing the lake to the islands upon which are Skinner's Cave and Balance Rock. From within the cave we have a fine view of Elephant Mountain.

But our own boat is waiting at the cove; we have eight miles to row, and the wind has now risen, and is against us. A single pair of oars must do the work, and strong arms which have worn the green of Dartmouth and the blue of Yale are equal to the contest. The goal is reached by seven o'clock, and the Model Farm-house supplies the wants of three hungry young men. Hereafter we must carefully watch the

ELEPHANT MOUNTAIN, FROM SKINNER'S CAVE.

SAILING WITH THE WIND-BAGS.

time, and not be governed by the long twilights, which frequently permit the reading of newspapers until nine o'clock. Any delay, however, on such evenings will be rewarded by the sight of a gorgeous sunset. At that hour the lake has composed itself for the night. The purple tints of the Elephant and Owl's Head are mirrored upon its surface, while over beyond them all the brightness of the western sky shows where are held captive the struggling rays of the summer's sun. Nor are they all released until far into the night; and when the last one has departed, only three hours pass before the opposite horizon is aglow with the light of a new-born day. We can almost say that this region is an empire upon which the sun never sets; for all night long are visible the wonders of the *aurora* to those who can resist the sleep-inviting coolness of the air.

But come with us to Magog, only ten miles to the north. We shall be gone only three days, and shall see no one. It threatens rain, but our wardrobe can not be spoiled. We have the favoring breeze which we so much desired. *The Ripple* is laden with the camera and fishermen's furnishings, and off we go. The wind increases to a hurricane. We dodge the frequent

showers by running the boat ashore and creeping under the bushes. Occasionally a lull of the storm allows us to bail out the craft, and again to fly before the wind. So great is the force of the breeze, and so high are the white-caps, that we do not dare to spread the sail; but the "wind-bags" take us along at a very rapid rate, and Magog is at last reached, just before supper.

The next day was cloudy, but in the afternoon the sun came out, and the camera was pointed at Mount Orford, only four miles to the west. Beautiful shadows flitted across the picture, and were reflected upon the sketch-book within the instrument.

Our sports were numerous. Early rising and adroit use of the trolling-line sometimes were successful in placing a fine pickerel upon the breakfast-table. Then we rowed to the landing of the steamer to ogle the latest arrivals, to hear the news, and to see the fine strings of fish which were there offered for sale. Then we dined on fish served in every possible style. "Fish diet for brain-

MOUNT ORFORD, MAGOG RIVER, FROM MAGOG.

ALLAN'S POINT, MOLSON'S ISLAND, AND OWL'S HEAD, FROM GEORGEVILLE HILL.

workers," was the cry from pleasure-seekers whose hardest work was to roll ten-pins, and whose intellectual efforts were put forth mainly to reduce the extraordinary score of the ladies. Long drives over the hills, with reading and music, occupied the evenings. One morning, in the presence of us all, a member of the party lost his balance, and splashed into the water. Of course it was mortifying to be upset; but to be upset in a foot of water, and not to get wet all over, was even more trying. The next day the youngest of our party slipped from a plank and wet herself much more thoroughly.

The following day was Sunday, and we all met with an accident. There was to be no service in the church at Magog. Had there been service, it would have offered no attractions to us. So said those who knew whereof they spake. We therefore determined to attend service at the English church in Georgeville, and then dine at the

Model Farm-house. The morning was rather cold and foggy, but the mist soon lifted, and revealed the beautiful day which such a morning always insures in this climate. Our load was heavy for two horses, and so we proceeded slowly but pleasantly, arriving at the church as the service was half over. The usual congregation (about twenty) responded to the eloquent appeals from the pulpit, and nobly placed about one dollar in pennies on the contribution plate.

After taking our carriage and driving a mile we began to descend the southern slope of Georgeville Hill. Just here is the best of scenic effects to be seen, and such another view is not to be had from any other point on the eastern shore. With admirable judg-

AN OVERTURN.

CAPTAIN WRIGHT.

ment a banker of Montreal has placed his summer residence upon this ridge, and as close to the water as the bluff will allow. His grounds extend to the cove we have before spoken of, and terminate in a point corresponding to Allan's Point upon the farther side. We were in sight of this cove, and over beyond it were Molson's Island, and the Owl's Head upon the opposite shore. All this we were enjoying, when suddenly the forward axle broke, and before a scream could be uttered there was a promiscuous heap of humanity in the ditch. Recovering from the surprise, we were thankful that no one had been injured. Luckily the Model Farm-house was in sight, and there was waiting for us the most sumptuous repast. The want of a wagon was easily supplied, and the return was made in a much more comfortable conveyance than the one which broke down.

Just across the end of the lake, almost under the shadow of the mountain, is the residence of Captain Wright. From the hotel windows we had noticed the long line of buildings, and had wished that we might see the owner of "the ranch." So on one of our expeditions we crossed over and took the captain by storm. He was pleased, and with great attention showed us through his garden and orchard; then he bade us enter the house, all the time giving us bits of his history, for he had been a captain in the East India service. Mementoes of that part

of his life hung upon the walls, and quaint vases and curiously wrought bits of porcelain gave an Oriental air to the apartment. He amused us by producing several French books, very large, and some hundreds of years old; and while we looked through the heavy tomes and examined the rude woodcuts, he kept up a running dissertation upon their merits. We were entertained in true English style likewise, and were so well pleased with our reception that we repeated the visit, and found the captain as genial and cordial as before.

So the days at Magog slipped by, and two weeks scarcely contained the trip originally limited to three days. So pleasant have been the hours spent in Magog that all are loath to have the party broken up. The small boat is therefore placed on board the steamer, and we are all off for Newport. This lower end of the lake is much narrower than at any other part, the continuous lines of beach showing that it is also the most shallow. We pass Ward's Island, round Gibraltar Point, and are again at Knowlton Landing. Again we pass by the ancient fishermen, who choose this central spot because it is the deepest, and now from Georgeville wharf notice the Elephant. His outline is here seen to perfection, although we have noticed all the way up that there is very little change in his appearance: a grand old mountain, and within the clefts on his sides are brooks and small ponds abounding in trout. There are several land-

BLUE POINT, MOUNT ORFORD, AND ALLAN'S POINT, FROM THE MOUNTAIN HOUSE.

ings on the western bank close under the lofty ridge, but upon the opposite bank the only landing is at Georgeville, which is the only village on either hand as we proceed up the lake. The places before mentioned come within range of our vision, the Model Farm-house included. At Allan's Point the lake bends, and we have a view in both directions.

Soon the magnificent Owl's Head hangs over us, and we are beneath its dark shadow for nearly an hour. Then we pass Skinner's Cave, where the bold smuggler of that name lived and died. Numbers of small islands appear and disappear

as the steamer hugs the western shore. The largest of all contains but 100 acres, and is called Province Island. Through it runs the boundary line, which can readily be distinguished on the shore. The waters broaden, and the eastern shore becomes more flat. Stanstead Plain is visible at a distance of five miles. Bear Mountain comes in view on the right. Then Newport appears, and is soon reached, after passing Farrant's and Indian points. Here the large hotel gives opportunity for more display than we care for, but at the same time affords a variety, when enjoyed as one of many pleasures in and about Memphremagog. Choice music delights us through the evening, and we forget all care as we drop off to sleep with one of Strauss's dreamy waltzes in our ears.

The early morning train breaks up the party. *The Ripple* is launched, and a favoring breeze sends us toward Georgeville. The view of the lake from Newport, although extensive, is not satisfactory, so little of its surface being visible by reason of the many points which push themselves out from either shore. From Prospect Hill the finest view is had; but as we proceed in our boat, and pass these points, there is opened to us a broader and more complete view. The lake is here very much wider than the average (which is perhaps two miles), and this extra width is toward the eastern shore. Several of the larger islands are in this enlargement, the Twin Sisters being the most

FARRANT'S POINT, BEAR MOUNTAIN, AND OWL'S HEAD, FROM NEWPORT.

attractive. The steamer passes close to the farther shore, and the passengers see these islands only in the distance.

The pure mountain air is conducive to sleep, and, more than all, the locality is secure from the intrusion of any who might prove uncongenial. The shores of these islands are of greenstone and slate; the strata of the latter are thrown about with every imaginable dip, and often rest upon boulders of the former. Rugged pines spring from the solid rock, with no nourishment save that afforded through an occasional cleft, and the rocky nature of the shores is varied by small beaches overhung with the maple and birch. From the Twin Sisters we proceed to Province Island, and thence to the Mountain House. Then crossing over to the other shore, we pass the summer residences of Judge Day and Mr. Molson. There are only four such places of enjoyment and recreation along the whole thirty miles which measure the extreme length of this lake, and all these four belong to residents of Montreal. We are satisfied that the whole eastern shore would be filled with like beauty if only these waters were of easier access from that city. A railroad from Waterloo to Sherbrooke will soon pass through Magog, and thus furnish the missing link. Then we predict a grand and glorious future for Memphremagog.

At length these long glorious days of mid-summer are followed by the ever-shortening days of the early fall. Before the leaves

have an opportunity to wither they are touched with mild frosts, and give forth every hue of the rainbow. The heat of the September sun warns them that they have not long to stay, therefore they strive to excel in vivid colors and exquisite tints. In this they succeed; and all will admit that this season here far surpasses even the unusual brilliancy of a New England autumn.

Now we must prepare to depart before the

melancholy days shall come in earnest. *The Ripple* is placed upon her cart, and is left upon the wharf at Georgeville to be transported thence to the interior. She has proved a true friend in all our wanderings, and perhaps we may have her company again at some future time. With a parting look at the Elephant and the Owl's Head, we drive over the hills, and at Stanstead take our departure for a more genial clime.

TROUT-FISHING.

'Tis twenty years. Do you remember
When, boy and girl, we stole the skiff,
And went a-fishing one September?
The lake so clear, it was as if,
Upborne on love's delicious leaven,
We floated in a pure mid-heaven,
With clouds of lilies for a border.
The fragrant summer seemed to ache
In blossom for dear passion's sake,
Excessive with its sweet disorder.
In you, too, was that fond distress
Of flush and fear and happiness,
Caresses by caress unhanded,
Till, fingers mated on the reel,
I thought the very trout could feel
His double spoil was caught and landed.

Alas! that love which we remember,
Blush-ripe as all those wanton weeds,
Should be a blossom of September,
Born guiltless of the promise seeds—

Sweet dying things, whose only duty
Is clothing life in forms of beauty!
For though I held you in my arms,
As full of honey in your charms
As when the trefoil holds the clover,
Your fingers, tutored in a thimble,
In playing trout were found so nimble
You hooked the fish and cast the lover.

But often, since we slipped the books
To play for life with baited hooks
In pools less pure, do I remember
The fragile blossom of September,
Born guiltless of the promise seeds—
A dying thing, whose only duty
Was clothing life in forms of beauty,
With heaven above and heaven below it
Though life has grown to other needs,
Our boat lies rotting in the weeds,
And we can neither raise nor row it.

CHAPTER XLIX.

EDITH'S NEW FRIEND.

EVERY day Edith and Dudleigh saw more and more of one another. Now that the crust of reserve was broken through, and something like intimacy had been reached, the sick man's apartment was the most natural place for each to seek. It came at last that the mornings and afternoons were no longer allotted to each exclusively, but while one watched, the other would often be present. In the evenings especially the two were together there.

The condition in which Dalton was demanded quiet, yet needed but little direct attention. It was only necessary that some one should be in the room with him. He lay, as has been said, in a state of stupor, and knew nothing of what was going on. It was only necessary for those who might be with him to give him, from time to time, the medicines that had been prescribed by the physicians, or the nourishment which nature demanded. Apart from this there was little now to be done.

While Edith and Dudleigh were thus together, they were naturally dependent exclusively upon one another. This association seemed not unpleasant to either of them; every day it gained a new charm; and at length both came to look forward to this as the chief pleasure of their lives. For Edith there was no other companion than Dudleigh in Dalton Hall with whom she could asso-

ciate on equal terms; he had strong claims now on her confidence, and even on her gratitude; and while he was thus the only one to whom she could look for companionship, she also bore the same relation to him.

There was something in the look and in the manner of Dudleigh in these interviews which might have moved a colder nature than that of Edith. Whenever he entered and greeted her, his face was overspread by a radiant expression that spoke of joy and delight. Whenever they met, his face told all the feelings of his heart. Yet never in any way, either by word or act, did he venture upon any thing which might not have been witnessed by all the world. There was something touching in that deep joy of his which was inspired simply by her presence, and in the peace and calm that came over him while she was near. Elsewhere it was different with him. Whenever she had seen his face outside—and that had been often, for she had often seen him riding or walking in front of the windows—she had marked how care-worn and sad its expression was; she had marked a cloud of melancholy upon his brow, that bore witness to some settled grief unknown to her, and had read in all the lineaments of his features the record which some mysterious sorrow had traced there. Yet in her presence all this departed, and the eyes that looked on her grew bright with happiness, and the face that was turned toward her was overspread with joy. Could it be any other than herself who made this change?

There was something in the manner of this man toward her which was nothing less than adoration. The delicate grace of his address, the deep reverence of his look, the intonations of his voice, tremulous with an emotion that arose from the profoundest depths of his nature, all bore witness to this. For when he spoke to her, even about the most trifling things, there was that in his tone which showed that the subject upon which he was speaking was nothing, but the one to whom he was speaking was all in all. He stood before her like one with a fervid nature, intense in its passion, and profound in all its emotion, who under a calm exterior concealed a glow of feeling which burned in his heart like a consuming fire—a feeling that was kept under restraint by the force of will, but which, if freed from restraint but for one moment, would burst forth and bear down all before it.

Weeks passed away, but amidst all the intimacy of their association there never appeared the slightest attempt on his part to pass beyond the limits which he had set for

"THERE WAS THE HISS OF SOMETHING SCORCHING."—[SEE PAGE 356.]

himself. Another man under such circumstances might have ventured upon something like a greater familiarity, but with this man there was no such attempt. After all their interviews he still stood in spirit at a distance, with the same deep reverence in his look, and the same profound adoration in his manner, regarding her as one might regard a divinity. For Dudleigh stood afar off, yet like a worshiper—far off, as though he deemed that divinity of his inaccessible—yet none the less did his devotion make itself manifest. All this was not to be seen in his words, but rather in his manner, in the expression of his face, and in the attitude of his soul, as it became manifest to her whom he adored.

For she could not but see it; in matters of this sort woman's eyes are keen; but here any one might have perceived the deep devotion of Dudleigh. The servants saw it, and talked about it. What was plain to them could not but be visible to her. She saw it—she knew it—and what then? Certainly it was not displeasing. The homage thus paid was too delicate to give offense; it was of that kind which is most flattering to the heart, which never grows familiar, but is insinuated or suggested rather than expressed.

It was consoling to her lonely heart to see one like this, who, whenever she appeared, would pass from a state of sadness to one of happiness; to see his eloquent eyes fixed

upon her with a devotion beyond words; to hear his voice, which, while it spoke the commonplaces of welcome, was yet in its tremulous tones expressive of a meaning very different from that which lay in the words. Naturally enough, she was touched by this silent reverence which she thus inspired; and as she had already found cause to trust him, so she soon came to trust him still more. She looked up to him as one with whom she might confer, not only with reference to her father, but also with regard to the conduct of the estate. Thus many varied subjects grew up for their consideration, and gradually the things about which they conversed grew more and more personal. Beginning with Mr. Dalton, they at last ended with themselves, and Dudleigh on many occasions found opportunity of advising Edith on matters where her own personal interest or welfare was concerned.

Thus their intimacy deepened constantly from the very necessities of their position.

Then there was the constant anxiety which each felt and expressed about the health of the other. Each had urged the other to give up the allotted portion of attendance. This had ended in both of them keeping up that attendance together for a great part of the time. Nevertheless, the subject of one another's health still remained. Dudleigh insisted that Edith had not yet recovered, that she was nothing better than a convalescent, and that she ought not to risk such

close confinement. Edith, on the contrary, insisted that she was able to do far more, and that the confinement was injuring him far more than herself. On one occasion she asked him what he thought would become of her if he too became ill, and the care of the two should thus devolve upon her.

At this remark, which escaped Edith in the excitement of an argument about the interesting subject of one another's health, Dudleigh's face lighted up. He looked at her with an expression that spoke more than words could tell. Yet he said nothing. He said nothing in words, but his eyes spoke an intelligible language, and she could well understand what was thus expressed.

What was it that they said?

O loved! and O adored beyond weak words! O divinity of mine! they said. If death should be the end of this, then such death would be sweet, if I could but die in your presence! O loved and longed for! they said. Between us there is an impassable barrier. I stand without; I seek not to break through; but even at a distance I love, and I adore!

And that was what Edith understood. Her eyes sank before his gaze. They sat in silence for a long time, and neither of them ventured to break that silence by words.

At length Dudleigh proposed that they should both go out for a short time each day together. This he had hesitated to do on account of Mr. Dalton. Yet, after all, there was no necessity for them to be there always. Mr. Dalton, in his stupor, was unconscious of their presence, and their absence could therefore make no difference to him, either with regard to his feelings or the attention which he received. When Dudleigh made his proposal, he mentioned this also, and Edith saw at once its truth. She therefore consented quite readily, and with a gratification that she made no attempt to conceal.

Why should she not? She had known enough of sorrow. Dalton Hall had thus far been to her nothing else than a prison-house. Why should it not afford her some pleasure as an offset to former pain? Here was an opportunity of obtaining at last some compensation. She could go forth into the bright free open air under the protection of one whose loyalty and devotion had been sufficiently proved. Could she hope for any pleasanter companion?

Thus a new turn took place in the lives of these two. The mornings they passed in Mr. Dalton's room, and in the afternoons, except when there was unpleasant weather, they went out together. Sometimes they strolled through the grounds, down the lordly avenues, and over the soft sweet meadows; at other times they went on horseback. The grounds were extensive and beautiful, but confinement within the park inclosure

was attended with unpleasant memories, and so, in the ordinary course of things, they naturally sought the wider, freer world outside.

The country around Dalton Hall was exceedingly beautiful, and rich in all those peculiar English charms whose quiet grace is so attractive to the refined taste. Edith had never enjoyed any opportunity of seeing all this, and now it opened before her like a new world. Formerly, during her long imprisonment, she had learned to think of that outside world as one which was full of every thing that was most delightful; there freedom dwelt; and that thought was enough to make it fair and sweet to her. So the prisoner always thinks of that which lies beyond his prison walls, and imagines that if he were once in that outer world he would be in the possession of perfect happiness.

Horseback riding has advantages which make it superior to every other kind of exercise. On foot one is limited and restrained, for progress is slow; and although one can go any where, yet the pedestrian who wishes for enjoyment must only stroll. Any thing else is too fatiguing. But a small space can be traversed, and that only with considerable fatigue. In a carriage there is ease and comfort; but the high-road forms the limit of one's survey; to that he must keep, and not venture out of the smooth beaten track. But on horseback all is different. There one has something of the comfort of the carriage and something of the freedom of the pedestrian. Added to this, there is an exhilaration in the motion itself which neither of the others presents. The most rapid pace can alternate with the slowest; the highway no longer forms bounds to the journey; distance is no obstacle where enjoyment is concerned; and few places are inaccessible which it is desirable to see. The generous animal which carries his rider is himself an additional element of pleasure; for he himself seems to sympathize with all his rider's feelings, and to such an extent that even the solitary horseman is not altogether alone.

This was the pleasure which Edith was now able to enjoy with Dudleigh as her companion, and the country was one which afforded the best opportunity for such exercise. Dudleigh was, as has been said, a first-rate horseman, and managed his steed like one who had been brought up from childhood to that accomplishment. Edith also had always been fond of riding; at school she had been distinguished above all the others for her skill and dash in this respect; and there were few places where, if Dudleigh led, she would not follow.

All the pleasure of this noble exercise was thus enjoyed by both of them to the fullest extent. There was an exhilaration in it

which each felt equally. The excitement of the rapid gallop or the full run, the quiet sociability of the slow walk, the perfect freedom of movement in almost any direction, were all appreciated by one as much as by the other. Then, too, the country itself was of that character which was best adapted to give pleasure. There were broad public roads, hard, smooth, and shadowed by overarching trees—roads such as are the glory of England, and with which no other country has any that can compare. Then there were by-roads leading from one public road to another, as smooth and as shadowy as the others, but far more inviting, since they presented greater seclusion and scenes of more quiet picturesque beauty. Here they encountered pleasant lanes leading through peaceful sequestered valleys, beside gently flowing streams and babbling brooks, where the trees overarched most grandly and the shade was most refreshing. Here they loved best to turn, and move slowly onward at a pace best suited to quiet observation and agreeable conversation.

Such a change from the confinement of Dalton Hall and Dalton Park was unspeakably delightful to Edith. She had no anxiety about leaving her father, nor had Dudley; for in his condition the quiet housekeeper could do all that he would require in their absence. To Edith this change was more delightful than to Dudley, since she had felt those horrors of imprisonment which he had not. These rides through the wide country, so free, so unrestrained, brought to her a delicious sense of liberty. For the first time in many weary months she felt that she was her own mistress. She was free, and she could enjoy with the most intense delight all the new pleasures of this free and unrestrained existence. So in these rides she was always joyous, always gay, and even enthusiastic. It was to her like the dawn of a new life, and into that life she threw herself with an abandonment of feeling that evinced itself in unrestrained enjoyment of every thing that presented itself to her view.

Dudley, however, was very different. In him there had always appeared a certain restraint. His manner toward Edith had that devotion and respect which have already been described; he was as profound and sincere in his homage and as tender in his loyalty as ever; but even now, under these far more favorable circumstances, he did not venture beyond the limits of courtesy—those limits which society has established and always recognizes. From the glance of his eyes, however, from the tone of his voice, and from his whole mien, there could be seen the deep fervor of his feelings toward Edith; but though the tones were often tremulous with deep feeling, the words that he spoke seldom expressed more than the formulas of politeness. His true meaning lay behind or be-

neath his words. His quiet manner was therefore not the sign of an unemotional nature, but rather of strong passion reined in and kept in check by a powerful will, the sign and token of a nature which had complete mastery over itself, so that never on any occasion could a lawless impulse burst forth.

These two were therefore not uncongenial—the one with her enthusiasm, her perfect abandon of feeling, the other with his self-command, his profound devotion. Their tastes were alike. By a common impulse they sought the same woodland paths, or directed their course to the same picturesque scenes; they admired the same beauties, or turned away with equal indifference from the commonplace, the tame, or the prosaic. The books which they liked were generally the same. No wonder that the change was a pleasant one to Edith. These rides began to bring back to her the fresh feeling of her buoyant school-girl days, and restore to her that joyous spirit and that radiant fancy which had distinguished her at Plympton Terrace.

Riding about thus every where, these two became conspicuous. The public mind was more puzzled than ever. Those who maintained that Dudley was an impostor felt their confidence greatly shaken, and could only murmur something about its being done "for effect," and "to throw dust into the eyes of people;" while those who believed in him asserted their belief more strongly than ever, and declared that the unhappy differences which had existed between husband and wife had passed away, and terminated in a perfect reconciliation.

CHAPTER L.

A TERRIBLE ADVENTURE.

THUS Dudley and Edith found a new life opening before them; and though this life was felt by both to be a temporary one, which must soon come to an end, yet each seemed resolved upon enjoying it to the utmost while it lasted.

On one of these rides a remarkable event occurred.

It chanced that Edith's horse dropped a shoe, and they went slowly to the nearest village to have him reshod. They came to one before long, and riding slowly through it, they reached the farthest end of it, and here they found a smithy.

A small river ran at this end of the village across the road, and over this there was a narrow bridge. The smithy was built close beside the bridge on piles half over the edge of the stream. It faced the road, and, standing in the open doorway, one could see up the entire length of the village.

Here they dismounted, and found the farrier. Unfortunately the shoe had been lost, and the farrier had none, so that he had to make one for the occasion. This took up much time, and Edith and Dudleigh strolled up and down the village, stood on the bridge, and wandered about, frequently returning to the smithy to see how the work was progressing.

The last time they came they found that the smith was nearly through his work. They stood watching him as he was driving in one of the last nails, feeling a kind of indolent curiosity in the work, when suddenly there arose in the road behind them a frightful outburst of shrieks and cries. The smith dropped the horse's foot and the hammer, and started up. Dudleigh and Edith also turned by a quick movement to see what it might be.

A terrible sight burst upon them.

As they looked up the village street, they saw coming straight toward them a huge dog, which was being pursued by a large crowd of men. The animal's head was bent low, his jaw dropped, and almost before they fairly understood the meaning of what they saw, he had come close enough for them to distinguish the foam that dropped from his jaws, and his wild, staring, blood-shot eyes. In that moment they understood it. In that animal, which thus rushed straight toward them, and was already so near, they saw one of the most terrible sights that can appear to the eye of man—a mad dog!

The smith gave a yell of horror, and sprang to a window that looked out of the rear of the smithy into the stream. Through this he flung himself, and disappeared.

On came the dog, his eyes glaring, his mouth foaming, distancing all his pursuers, none of whom were near enough to deal a blow. They did not seem particularly anxious to get nearer to him, to tell the truth, but contented themselves with hurling stones at him, and shrieking and yelling from a safe distance in his rear.

On came the dog. There was no time for escape. Quick as thought Dudleigh flung himself before Edith. There was no time to seize any weapon. He had to face the dog unarmed, in his own unassisted strength. As for Edith, she stood paralyzed with utter horror.

On came the mad dog, and with a horrible snapping howl, sprang straight at Dudleigh.

But Dudleigh was prepared. As the dog sprang he hit straight out at him "from the shoulder," and dealt him a tremendous blow on the throat with his clinched fist. The blow hurled the animal over and over till he fell upon his back, and before he could regain his feet, Dudleigh sprang upon him and seized him by the throat.

He was a large and powerful animal. He struggled fiercely in the grasp of Dudleigh,

and the struggle was a terrific one. The villagers, who had now come up, stood off, staring in unspeakable horror, not one of them daring to interfere.

But the terror which had at first frozen Edith into stone now gave way to another feeling, a terror quite as strong, but which, instead of congealing her into inaction, roused her to frenzied exertion. Dudleigh's life was at stake! Terror for herself was paralysis to her limbs; terror for him was the madness of desperate exertion and daring.

She sprang toward one of the by-standers, who had a knife in his hand. This knife she snatched from him, and rushed toward Dudleigh. The dog was still writhing in his furious struggles. Dudleigh was still holding him down, and clutching at his throat with death-like tenacity. For a moment she paused, and then flinging herself upon her knees at the dog's head, she plunged the knife with all her strength into the side of his neck.

It was a mortal wound!

With a last howl, the huge animal relaxed his efforts, and in a few moments lay dead in the road.

Dudleigh rose to his feet. There was in his face an expression of pain and apprehension. The villagers stood aloof, staring at him with awful eyes. No word of congratulation was spoken. The silence was ominous; it was terrible. Edith was struck most of all by the expression of Dudleigh's face, and read there what she dared not think of. For a moment the old horror which had first seized upon her came upon her once more, paralyzing her limbs. She looked at him with staring eyes as she knelt, and the bloody knife dropped from her nerveless hands. But the horror passed, and once more, as before, was succeeded by vehement action. She sprang to her feet, and caught at his coat as he walked away.

He turned, with downcast eyes.

"O my God!" she exclaimed, in anguish, "you are wounded—you are bitten—and by that—" She could not finish her sentence.

Dudleigh gave her an awful look.

"You will die! you will die!" she almost screamed. "Oh, can not something be done? Let me look at your arm. Oh, let me examine it—let me see where it is! Show me—tell me what I can do."

Dudleigh had turned to enter the smithy as Edith had arrested him, and now, standing there in the doorway, he gently disengaged himself from her grasp. Then he took off his coat and rolled up his sleeve.

Edith had already noticed that his coat sleeve was torn, and now, as he took off his coat, she saw, with unutterable horror, his white shirt sleeves red with spots of blood. As he rolled up that sleeve she saw the marks of bruises on his arm; but it was on

one place in particular that her eyes were fastened—a place where a red wound, freshly made, showed the source of the blood stains, and told at what a terrible price he had rescued her from the fierce beast. He had conquered, but not easily, for he had carried off this wound, and the wound was, as he knew, and as she knew, the bite of a mad dog!

Edith gave a low moan of anguish and despair. She took his arm in her hands. Dudley did not withdraw it. Even at that moment of horror it seemed sweet to him to see these signs of feeling on her part; and though he did not know what it was that she had in her mind, he waited, to feel for a moment longer the clasp of those hands.

Edith held his arm in her hands, and the terrible wound fascinated her eyes with horror. It seemed to her at that moment that this was the doom of Dudley, the stamp of his sure and certain death. It seemed to her that this mark was the announcement to her that henceforth Dudley was lost to her; that he must die—die by a death so horrible that its horrors surpassed language and even imagination, and that this unutterable doom had been drawn down upon him for her.

It had been terrible. Out of pleasant thoughts and genial conversation and gentle smiles and happy interchange of sentiment, out of the joy of a glad day, out of the delight of golden hours and sunlight and beauty and peace—to be plunged suddenly into a woe like this!

There came to her a wild and desperate thought. Only one idea was in her mind—to save Dudley, to snatch this dear friend from the death to which he had flung himself for her sake. Inspired by this sole idea, there had come a sudden thought. It was the thought of that royal wife's devotion who, when her young husband lay dying from the poisoned dagger of an assassin, drew the poison from the wound, and thus snatched him from the very grasp of death. This it was, then, that was in the mind of Edith, and it was in her agonized heart at that moment to save Dudley even as Eleanor had saved Edward.

She bent down her head, till her face was close to his arm.

Dudley looked on as in a dream. He did not know, he could not even conceive, what she had in her heart to do for his sake. It would have seemed incredible, had he not seen it; nor could he have imagined it, had he not been convinced.

The discovery flashed suddenly, vividly across his mind. He recognized in that one instant the love, the devotion, stronger than death, which was thus manifesting itself in that slight movement of that adored one by his side. It was a thought of sweetness

unutterable, which amidst his agony sent a thrill of rapture through every nerve.

It was but for a moment.

He gently withdrew his arm. She looked at him reproachfully and imploringly. He turned away his face firmly.

"Will you leave me for a moment, Miss Dalton?" said he, in a choking voice.

He pointed to the doorway.

She did not appear to understand him. She stood, with her face white as ashes, and looked at him with the same expression.

"Leave me—oh, leave me," he said, "for one moment! It is not fit for you."

She did not move.

Dudley could wait no longer. His soul was roused up to a desperate purpose, but the execution of that purpose could not be delayed. He sprang to the fire. One of the irons had been imbedded there in the glowing coals. He had seen this in his despair, and had started toward it, when Edith detained him. This iron he snatched out. It was at a white heat, dazzling in its glow.

In an instant he plunged this at the wound. A low cry like a muffled groan was wrung from the spectators, who watched the act with eyes of utter horror.

There was the hiss of something scorching; a sickening smoke arose and curled up about his head, and ascended to the roof. But in the midst of this Dudley stood as rigid as Mucius Scævola under another fiery trial, with the hand that held the glowing iron and the arm that felt the awful torment as steady as though he had been a statue fashioned in that attitude. Thus he finished his work.

It was all over in a few seconds. Then Dudley turned, with his face ghastly white, and big drops of perspiration, wrung out by that agony, standing over his brow. He flung down the iron.

At the same moment Edith, yielding altogether to the horror that had hitherto overwhelmed her, fell senseless to the floor.

By this time some among the crowd had regained the use of their faculties, and these advanced to offer their services. Dudley was able to direct them to take Edith to some shelter, and while they did so he followed. Edith after some time revived. A doctor was sent for, who examined Dudley's arm, and praised him for his prompt action, while wondering at his daring. He bound it up, and gave some general directions.

Meanwhile a messenger had been sent to Dalton Hall for the carriage. Edith, though she had revived, hardly felt strong enough for horseback, and Dudley's arm was sufficiently painful to make him prefer as great a degree of quiet as possible. When the carriage came, therefore, it was with feelings of great relief that they took their seats and prepared to go back. Nor was

their journey any the less pleasant from the fact that they had to sit close together, side by side—a closer union than any they had thus far known. It was an eventful day; nor was its conclusion the least so. But little was said during the drive home. Each felt what had been done by the other. Edith remembered how Dudleigh had risked the most terrible, the most agonizing of deaths to save her. Dudleigh, on his part, remembered that movement of hers, by which she was about to take the poison from his wound unto herself. The appalling event which had occurred had broken down all reserve. All was known. Each knew that the other was dearer than all the world. Each knew that the other loved and was loved; but yet in the midst of this knowledge there was a feeling of utter helplessness arising from the unparalleled position of Edith. It was a peculiar and at the same time a perilous one.

In the eyes of the world these two were nothing less than man and wife. In the eyes of the law, as Edith feared, she was the wife of Leon Dudleigh.

Now this man was not Leon Dudleigh. He was an impostor. Edith did not even know that his name was Dudleigh at all. She had never asked him the secret of his life; he had never volunteered to tell it. She did not know what his name really was.

As an impostor, she knew that he was liable to discovery, arrest, and punishment at any time. She knew that the discovery of this man would endanger herself. His arrest would involve hers, and she would once more be tried for her life, as the murderer of the missing man, with the additional disadvantage of having already eluded justice by a trick. She was liable at any moment to this, for the missing man was still missing, and it would go doubly hard for her, since she had aided and abetted for so long a time the conspiracy of an impostor.

Yet this impostor was beyond all doubt a man of the loftiest character, most perfect breeding, and profoundest self-devotion. From the very first his face had revealed to her that he had entered upon this conspiracy for her sake. And since then, for her sake, what had he not done?

Thus, then, they were both in a position of peril. They loved one another passionately. But they could not possess one another. The world supposed them man and wife, but the law made her the wife of another, of whom it also charged her with being the murderer. Around these two there were clouds of darkness, deep and dense, and their future was utterly obscure.

These things were in the minds of both of them through that drive, and that evening as they walked about the grounds. For since their mutual love had all been revealed, Dudleigh had spoken in words what he had repressed so long, and Edith had con-

fessed what had already been extorted from her. Yet this mutual confession of love, with all its attendant endearments, had not blinded them to the dangers of their position and the difficulties that lay in their way.

"I can not endure this state of things," said Dudleigh. "For your sake, as well as my own, Edith darling, it must be brought to an end. I have not been idle, but I have waited to hear from those who have put themselves on the track of the man from whom we have most to dread. One has tried to find some trace of Leon; the other is my mother. Now I have not heard from either of them, and I am beginning to feel not only impatient, but uneasy."

CHAPTER LI.

IMPORTANT NEWS.

THE position of Edith and Dudleigh was of such a character that further inaction was felt to be intolerable, and it was only the hope of hearing from those who were already engaged in the work that made him capable of delaying longer. But several events now occurred which put an end to the present state of things.

The first of these was a marked improvement in the condition of Mr. Dalton. A successful operation performed upon him had the result of restoring him to consciousness, and after this a general increase of strength took place. His intense joy at the sight of Edith, and the delight which he felt at her presence and the reception of her loving and tender care, all acted favorably upon him; and as the sorrow which he had experienced had been the chief cause of his prostration, so the happiness which he now felt became a powerful agent toward restoring him to strength.

The joy of Edith was so great that the terror and perplexity of her position ceased to alarm her. Her greatest grief seemed now removed, for she had feared that her father might die without ever knowing how deeply she repented for the past and how truly she loved him. Now, however, he would live to receive from her those tender cares which, while they could never in her mind atone for the wrongs that she had inflicted upon him, would yet be the means of giving some happiness to him who had suffered so much.

A few days after her father's restoration to consciousness Dudleigh received a letter of a most important character, and as soon as he was able to see Edith during the walks that they still took in the afternoon or evening, he informed her with unusual emotion of the fact.

"She writes," he concluded, "that she has got at last on the track of Leon."

"Who? Your mother?"

"No. I have not heard from my mother. I mean Miss Fortescue."

"Miss Fortescue?" repeated Edith, in some surprise.

"Yes," said Dudley. "I did not mention her before, because I did not know what you might think about it. But the fact is, I saw her after the trial was over. She had come to give important testimony. She came to see me, and told me all about it. The information was of the most extraordinary kind. It appears that in the course of her own inquiries she had heard some gossip about a long box which had been put off at Finsbury from the train. This was called for by a teamster, who was accompanied by a Newfoundland dog, who took the box, and drove away from Finsbury to Dalton. Now, as no such teamster, or box, or dog, had been seen in Dalton, she began to suspect that it had something to do with the remains found in the well, and that this whole matter was a malignant scheme of Leon's to involve you or your father, or both, in some calamity. At any rate, she herself went cautiously about, and tried to investigate for herself. She had all along felt convinced that Leon was alive, and she felt equally convinced that he was capable of any malignant act for the purpose of wreaking his vengeance on you or your father. He had been baffled here, and had sworn vengeance. That much your father told me before the trial.

"So Miss Fortescue searched very carefully, and at length made a very important discovery. A few miles this side of Finsbury there is a grove, through which the Dalton Park wall runs. Here she happened to see the trace of heavy wheels, and the hedge which adjoins the wall, and is rather thin there, seemed to have been broken through, so as to form an opening wide enough to admit a cart. Struck by this, she followed the marks of the wheels into the grove for some distance, until they stopped. Here, to her surprise, she saw close by the Dalton Park wall an oblong box, just like the one which had been described to her. It was empty, and had been left here.

"Now why had it been left here? Miss Fortescue felt certain that Leon had brought a dead body in that box, that he had taken it stealthily into the park, and thrown it down into the well, and then, not wishing to be seen with such a very conspicuous thing as this box, he had left it behind him. She also thought that he had managed in a secret way to start the rumors that had prevailed, and to drop some hints, either by anonymous letters to the sheriff or otherwise, which turned their attention to the well. She saw at once how important this testimony would be in your favor, and therefore saw the Finsbury people who had told her of the teamster, and with these she came

to the trial. But when she came she heard that the missing man had returned—and saw me, you know."

At this extraordinary information Edith was silent for some time.

"I have often tried to account for it," said she, "but I could hardly bring myself to believe that this was his work. But now when I recall his last words to me, I can understand it, and I am forced to believe it."

"His last words to you?" said Dudley, in an inquiring tone.

"Yes," said Edith, with a sigh. "The remembrance of that night is so distressing that I have never felt able to speak of it. Even the thought of what I suffered then almost drives me wild; but now—and to you, Reginald—it is different, and I have strength to speak of it."

As she said this she looked at him tenderly, and Reginald folded her in his arms. She then began to give an account of that eventful night, of her long preparations, her suspense, her departure, until that moment when she saw that she was pursued. The remainder only need be given here.

She had been right in her conjectures. Leon had suspected, or at least had watched, and discovered all. The moonlight had revealed her plainly as she stole across the open area, and when she fled into the woods the rustling and crackling had betrayed the direction which she had taken. Thus it was that Leon had been able to pursue her, and his first sneering words as he came up to her made her acquainted with her awkwardness. The trees were not so close but that her figure could be seen; the moonlight streamed down, and disclosed her standing at bay, desperate, defiant, with her dagger uplifted, and her arm nerved to strike. This Leon saw, and being afraid to venture close to her, he held aloof, and tried to conceal his cowardice in taunts and sneers.

Edith said nothing for some time, but at last, seeing that Leon hesitated, she determined to continue her flight in spite of him, and informed him so.

Upon this he threatened to set the dog on her.

"He will tear you to pieces," cried Leon. "No one will suspect that I had any thing to do with it. Every body will believe that in trying to run away you were caught by the dog."

This threat, however, did not in the least alarm Edith. She was not afraid of the dog. She had already gained the animal's affections by various little acts of kindness. So now, in response to Leon's threats, she held out her hand toward the dog and called him. The dog wagged his tail and made a few steps forward. At this Leon grew infuriated, and tried to set him at Edith. But the dog would not obey. Leon then held

him, pointing his head toward Edith, and doing all in his power to urge him on. The effort, however, was completely useless. Edith, seeing this, hurried away. Leon rushed after her, followed by the dog, and once more she stood at bay, while the same efforts were repeated to set the dog at her. This was done several times over. At last Leon gave the dog a terrible beating. Wild with indignant rage at his cowardice, brutality, and persistent pursuit, full also of pity for the poor animal who was suffering for love of her, Edith sprang forward at Leon as though she would stab him. Whether she would have done so or not, need not be said; at any rate her purpose was gained, for Leon, with a cry of fear, started back.

Then standing at a safe distance, he hurled at her the most terrible threats of vengeance. Among all these she remembered well one expression, which he repeated over and over.

"You've threatened my life!" he cried. "My life shall lie at your door, if I have to kill myself."

This he said over and over. But Edith did not wait much longer. Once more she started off, and this time Leon did not follow her. That was the last she saw or heard of him. After this she wandered about through woods and swamps for a long time, and at length, about the dawn of day, when she had almost lost all hope, she came to the wall. This she clambered over by means of her rope and hook, and reached the Dalton Inn in the condition already described.

Afterward, when she heard that Leon was missing, and when she was confronted with the remains, the whole horror of her situation burst upon her mind. Her first thought was that he had in his desperate rage actually killed himself; but the absence of the head showed that this was impossible. There remained after this a deep mystery, the solution of which she could not discover, but in the midst of which she could not fail to see how terribly circumstances bore against her. She was afraid to say any thing. She knew that if she told all she would be believed but in part. If she confessed that she had seen him, and had quarreled with him on that night, then all men would conclude that she had also murdered him so as to escape. She saw also how hopeless it was to look for any testimony in her favor. Every thing was against her. Being in ignorance of her father and Lady Dudley, she had supposed that they would be most relentless of all in doing her to death; and the excitement of the latter over the loss of Leon was never suspected by her to be the frenzied grief of a mother's heart over a sudden and most agonizing bereavement.

But now all these things were plain. Another shared her secret—one, too, who would lay down his life for her—and the efforts of

Miss Fortescue had resulted in suggesting to her mind a new solution of the mystery.

After the natural comments which were elicited by Edith's strange story, Reginald showed her the letter which he had received from Miss Fortescue. It was not very long, nor was it very definite. It merely informed him that she had reason to believe that she had at last got upon the track of Leon; and requested him to come to her at once, as there was danger of losing this opportunity if there was any delay. She appointed a place at which she would meet him three days from the date of the letter, where she would wait several days to allow for all delay in his reception of the letter. The place which she mentioned was known to Reginald as the nearest station on the railway to Dudley Manor.

"This must decide all," said Reginald. "They are playing a desperate game, and the part which must be done by my mother and myself is a terrible one. If we fail in this, we may have to fly at once. But if I can only see Leon once, so as to drag him before the world, and show that he is alive—if I can only save you, darling, from your terrible position, then I can bear other evils in patience for a time longer."

"You have heard nothing from your mother, then?" said Edith, a few moments afterward.

Dudleigh shook his head.

"No," said he, with a sigh. "And I feel anxious—terribly anxious. I was very unwilling for her to go, and warned her against it; but she was determined, and her reasons for doing so were unanswerable; still I feel terribly alarmed, for Sir Lionel is a man who would stop at nothing to get rid of one whom he thinks is the only witness against him."

CHAPTER LII.

THE STORY OF FREDERICK DALTON.

AFTER Dudley's departure Edith was left more exclusively with her father, and had the satisfaction of seeing that under her tender care he grew stronger and more happy every day. In the long confidences between these two, who had once been so separated, all was gradually explained, and Edith learned not only the whole truth about that calamity which had befallen him in early life, but also the reason of that once inexplicable policy which he had chosen with regard to herself.

Lionel Dudley and he had been friends from boyhood, though the weak and lavish character of the former had gradually put them upon divergent lines of life, which even Lionel's marriage with his sister, Claudine Dalton, could not bring together again. For Lionel had fallen into evil courses, and

had taken to the common road of ruin—the turf; and though it had been hoped that his marriage would work a reformation, yet those hopes had all proved unfounded. Years passed. Two children were born to Lionel Dudleigh—Reginald and Leon; yet not even the considerations of their future welfare, which usually have weight with the most corrupt, were sufficiently powerful to draw back the transgressor from his bad career.

He became terribly involved in debt. Twice already his debts had been paid, but this third time his father would assist him no longer. His elder brother, then heir to the estate, was equally inexorable; and Frederick Dalton was the one who came forward to save his sister's husband and his old friend from destruction.

On this occasion, however, Lionel was not frank with Dalton. Perhaps he was afraid to tell him the whole amount of his debts, for fear that Dalton would refuse to do any thing. At any rate, whatever the cause was, after Dalton had, as he supposed, settled every thing, Lionel was pressed as hard as ever by a crowd of creditors, whom this partial settlement had only rendered the more ravenous.

Pressed hard by one of these, the wretched man had forged a check on the Liverpool banker, Mr. Henderson, and this check he had inclosed in a letter to Frederick Dalton, requesting him to get the money and pay one or two debts which he specified. This Dalton did at once, without hesitation or suspicion of any sort.

Then came the discovery, swift and sudden, that it was a forgery. But one feeling arose in Dalton's mind, and that was a desire to save Lionel. He hurried off at once to see him. The wretched man confessed all. Dalton at once went to Liverpool, where he saw Mr. Henderson, and tried to save his friend. He came away from that interview, however, only to make known to Lionel the banker's obstinacy and resolution to have vengeance.

Dalton's solicitor in Liverpool was Mr. John Wiggins. Lionel's presence in Liverpool was not known to any one but Dalton. He had seen Wiggins once, and persuaded Lionel to see him also, to which the latter consented only with extreme difficulty. The interview never took place, however, nor was Wiggins aware of Lionel's presence in Liverpool, or of his guilt. Then the murder took place, and the paper was found which criminated Dalton, who was at once arrested.

Dalton was thunder-struck, not so much at his own arrest as at the desperation of his friend and his utter baseness. He knew perfectly well who the murderer was. The Maltese cross which had been found was not necessary to show him this. No other man could have had any motive, and no other man could have thought of mention-

ing his name in connection with the terrible deed. It was thus that Dalton found himself betrayed in the foulest manner, through no other cause than his own generosity.

The horror of Mrs. Dudleigh on hearing of her brother's arrest was excessive. She went off at once to see him. Even to her Dalton said nothing about Lionel's guilt, for he wished to spare her the cruel blow which such intelligence would give.

The feeling that now animated Dalton can easily be explained. In the first place, knowing that he was innocent, he had not the faintest doubt that he would be acquitted. He believed that where there was no guilt, no such thing as guilt could be proved. He relied also on his well-known reputation.

Feeling thus confident of his own innocence, and certain of acquittal, he had only to ask himself what he ought to do with reference to Lionel. Strict justice demanded that he should tell all that he knew; but there were other considerations besides strict justice. There was the future of Lionel himself, whom he wished to spare in spite of his baseness. More than this, there was his sister and his sister's children. He could not bring himself to inform against the guilty husband and father, and thus crush their innocent heads under an overwhelming load of shame. He never imagined that he himself, and his innocent wife and his innocent child, would have to bear all that which he shrank from imposing upon the wife and children of Lionel.

The trial went on, and then came forth revelations which showed all to Mrs. Dudleigh. That Maltese cross was enough. It was the key to the whole truth. She saw her brother, and asked him. He was silent. Frantic with grief, she hurried back to her husband. To her fierce reproaches he answered not a word. She now proceeded to Liverpool. Her brother entreated her to be calm and silent. He assured her that there was no possible danger to himself, and implored her, for the sake of her children, to say nothing. She allowed herself to be convinced by him, and to yield to entreaties uttered by the very accused himself, and in the name of her children. She believed in his innocence, and could not help sharing his confidence in an acquittal.

That acquittal did come—by a narrow chance, yet it did come; but at once, to the consternation of both brother and sister, the new trial followed. Here Dalton tried to keep up his confidence as before. His counsel implored him to help them in making his defense by telling them what he knew, but Dalton remained fatally obstinate. Proudly confiding in his innocence, and trusting to his blameless life, he still hesitated to do what he considered an act of merciless cruelty to his sister, and he still

persuaded her also to silence, and still prophesied his own acquittal, and the rescue of her husband and children from ruin. Part of his prophecy was fulfilled. The husband and children of the sister were indeed saved, but it was at the expense of the innocent and devoted brother.

The effect was terrible. Dalton heard of his wife's illness. He had written to her before, full of confidence, and trying to cheer her; but from the first Mrs. Dalton had looked for the worst; not that she supposed her husband could possibly be otherwise than innocent, but simply because she was timid and afraid of the law. She had good reason to fear. Word was brought to Dalton that she was dying, and then the news came that she was dead.

Meanwhile Mrs. Dudleigh, more frenzied than ever, flew to see her husband. She found that he had gone to the Continent. She pursued him, and reached him in Italy. Here she called upon him to confess his guilt, and save his innocent friend. He refused. He dared not. She threatened to denounce him. He fell at her feet and implored her mercy in the name of their children. He entreated her to wait, to try other means first, to get a new trial—any thing.

Mrs. Dudleigh's threats to inform against him were easy to make, yet not so easy to carry out. Turning from her husband in horror, she returned to England with the fixed intention of telling every thing. His letter to Dalton could have been shown, and the Maltese cross could have proved who the murderer was. But Mrs. Dudleigh's courage faltered when she reached her home and saw her children. Already she had heard of Mrs. Dalton's death; already she knew well that Edith Dalton was doomed to inherit a name of shame, a legacy of dishonor, and that she alone could now avert this. But to avert this she must doom her own children. Had it been herself only and her guilty husband, it would have been easy to be just; but here were her children standing in the way and keeping her back.

Her struggles were agonizing. Time passed on; the delay was fatal. Time passed, and the distracted mother could not make up her mind to deal out ruin and shame to her children. Time passed, and Dalton was taken away to that far-distant country to which he had been sentenced—transported for life.

Other changes also took place. Lionel's father and elder brother both died within a short time of one another, leaving him heir to the estate and the baronetcy. He was now Sir Lionel Dudleigh, and she was Lady Dudleigh; and her brother—the pure in heart, the noble, the devoted—what and where was he?

The struggle was terrible, and she could not decide it. It seemed abhorrent for her to rise up and denounce her husband, even

to save her brother. She could not do it, but she did what she could. She wrote her husband a letter, bidding him farewell, and imploring him to confess; took her son Reginald, the eldest, leaving behind the younger, Leon, and prepared to go to her brother, hoping that if she could not save him, she might at least alleviate his sorrows. She took with her Hugo, a faithful old servant of the Dalton family, and with him and Reginald went to Australia.

Meanwhile Dalton had been in the country for a year. Before leaving he had not been unmindful of others even in that dire extremity. He had only one thought, and that was his child. He had learned that Miss Plympton had taken her, and he wrote to her, urging her never to tell Edith her father's story, and never to let the world know that she was his daughter. He appointed Wiggins agent for his estates and guardian of Edith before he left; and having thus secured her interests for the present, he went to meet his fate.

In Sydney he was treated very differently from the common convicts. Criminals of all classes were sent out there, and to the better sort large privileges were allowed. Dalton was felt by all to be a man of the latter kind. His dignified bearing, his polish and refinement, together with the well-known fact that he had so resolutely maintained his innocence, all excited sympathy and respect.

When Lady Dudleigh arrived there with Hugo and her son, she soon found out this, and this fact enabled her to carry into execution a plan which she had cherished all along during the voyage. She obtained a sheep farm about a hundred miles away, applied to the authorities, and was able to hire Dalton as a servant. Taking him in this capacity, she went with him to the sheep farm, where Hugo and Reginald also accompanied them. One more was afterward added. This was the man "Wilkins," who had been sentenced to transportation for poaching, and had come out in the same ship with Dalton. Lady Dudleigh obtained this man also, under Dalton's advice, and he ultimately proved of great assistance to them.

Here in this place years passed away. Dalton's only thought was of his daughter. The short formal notes which were signed "John Wiggins," all came from him. He could not trust himself to do any more. The sweet childish letters which she wrote once or twice he kept next his heart, and cherished as more precious than any earthly possession, but dared not answer for fear lest he might break that profound secret which he wished to be maintained between her and himself—her, the pure young girl, himself, the dishonored outcast. So the years passed, and he watched her from afar in his thoughts, and every year he thought

THE UNIVERSITY OF MICHIGAN LIBRARY

of her age, and tried to imagine what she looked like.

During these years there was rising among them another spirit—a character—whose force was destined to change the fortune of all.

This was Reginald.

From the first he had known the whole story—more than Leon had known. Leon had known his father's guilt and Dalton's innocence, but Reginald had been the confidant of his mother, the witness of her grief and her despair. He had lived with Dalton, and year after year had been the witness of a spectacle which never ceased to excite the deepest emotion, that of an innocent man, a just man, suffering wrongfully on behalf of another. His own father he had learned to regard with horror, while all the enthusiastic love of his warm young heart had fixed itself upon the man who had done all this for another. He knew for whom Dalton had suffered. It was for his mother, and for himself, and he knew that he was every day living on the sufferings and the woe of this broken-hearted friend. Gradually other motives arose. He was a witness of Dalton's profound and all-absorbing love for his daughter, and his passionate desire to save her from all knowledge of his own shame. To Reginald all this grew more and more intolerable. He now saw the worst result of all, and he felt that while his own father had thrown upon his friend his load of infamy, so he himself, the son, was throwing upon Edith Dalton all that inherited infamy.

At last his resolution was taken. He informed his mother. She had been aware of his struggles of soul for years, and did not oppose him. Indeed, she felt some relief. It was for the son's sake that she had faltered when justice demanded her action. Now that son had grown to be a calm, strong, resolute man, and he had decided.

Yes, the decision was a final one. Not one objection was disregarded. Every thing was considered, and the resolution was, at all hazards, and at every cost, to do right. That resolution involved the accusation, the trial, the condemnation, the infamy—yes, the death—of a husband and a father; but even at that cost it was the resolve of Reginald that this thing should be.

The plan of escape occupied far less time. Dalton objected at first to the whole thing, but Reginald had only to mention to him his daughter's name to induce him to concur.

After this it was given out that Frederick Dalton had died. This statement was received by the authorities without suspicion or examination, though the conspirators were prepared for both.

Then Frederick Dalton, under an assumed name, accompanied by Hugo, went to Sydney, where he embarked for England. No

one recognized him. He had changed utterly. Grief, despair, and time had wrought this. Reginald and his mother went by another ship, a little later, and had no difficulty in taking Wilkins with them. They all reached England in safety, and met at a place agreed upon beforehand, where their future action was arranged.

On the voyage home Dalton had decided upon that policy which he afterward sought to carry out. It was, first of all, to live in the utmost seclusion, and conceal himself as far as possible from every eye. A personal encounter with some old acquaintance, who failed to recognize him, convinced him that the danger of his secret being discovered was very small. His faithful solicitor, John Wiggins, of Liverpool, would not believe that the gray-haired and venerable man who came to him was the man whom he professed to be, until Dalton and Reginald had proved it by showing the letters, and by other things. By John Wiggins's suggestion Dalton assumed the name of Wiggins, and gave himself out to be a brother of the Liverpool solicitor. No one suspected, and no questions were asked, and so Dalton went to Dalton Hall under the name of Wiggins, while Lady Dudley went as Mrs. Dunbar, to be housekeeper; and their domestics were only Hugo and Wilkins, whose fidelity was known to be incorruptible, and who were, of course, intimately acquainted with the secret of their master.

Here Dalton took up his abode, while John Wiggins, of Liverpool, began to set in motion the train of events which should end in the accomplishment of justice. First, it was necessary to procure from the authorities all the documentary and other evidence which had been acquired ten years before. Several things were essential, and above all the Maltese cross. But English law is slow, and these things required time.

It was the intention of Dalton to have every thing in readiness first, and then send Reginald and Lady Dudley to Sir Lionel to try the force of a personal appeal. If by threats or any other means they could persuade him to confess, he was to be allowed time to fly to some safe place, or take any other course which he deemed most consistent with his safety. Dalton himself was not to appear, but to preserve his secret inviolable. If Sir Lionel should prove impracticable, then the charge and arrest should take place at once; whether for forgery or murder was not decided. That should be left to Reginald's own choice. They leaned to mercy, however, and preferred the charge of forgery. Sir Lionel was mistaken in supposing Lady Dudley to be the only witness against him, for Reginald had been present at more than one interview between the frenzied wife and the guilty husband, and had heard his father confess the whole.

But the regular progress of affairs had been altogether interrupted by the sudden appearance of Edith. On reaching Dalton Hall Mr. Dalton had felt an uncontrollable eagerness to see her, and had written to Miss Plympton the letter already reported. He did not expect that she would come so soon. He thought that she would wait for a time; that he would get an answer, and arrange every thing for her reception. As it was, she came at once, without any announcement, accompanied by Miss Plympton and her maid.

For years Dalton had been kept alive by the force of one feeling alone—his love for his daughter. Out of the very intensity of his love for her arose also another feeling, equally intense, and that was the desire to clear his name from all stain before meeting with her. At first he had intended to refrain from seeing her, but, being in England, and so near, his desire for her was uncontrollable. Reginald had gone for a tour on the Continent. The Hall was lonely; every room brought back the memory of his lost wife, and of that little Edith who, years before, used to wander about these halls and amidst these scenes with him. He could not endure this enforced separation, and so he wrote as he did. He expected he scarcely new what. He had a vague idea that though he refused to make himself known, that she nevertheless might divine it, or else, out of some mysterious filial instinct, might love him under his assumed name as fervently as though there was no concealment.

When she came so suddenly, he was taken by surprise. He longed to see her, but was afraid to admit her companions; and so it was that his daughter, in whom his life was now bound up, was almost turned away from her father's gates.

Then followed her life at Dalton Hall. Dalton, afraid of the outside world, afraid to be discovered, after having done so much for safety, at the very time when deliverance seemed near, looked with terror upon Edith's impatience. He risked an interview. He came full of a father's holiest love, yet full of the purpose of his life to redeem the Dalton name for her sake. He met with scorn and hate. From those interviews he retired with his heart wrung by an anguish greater than any that he had ever known before.

And so it went on. It was for her own sake that he restrained her; yet he could not tell her, for he had set his heart on not revealing himself till he could do so with an unstained name. But he had made a mistake at the very outset from his impatient desire to see her, and he was doomed to see the results of that mistake. Miss Plympton was turned away, and forthwith appealed to Sir Lionel. The result of this was that Leon came. Leon recognized Wilkins, and could

not be kept out. He did not know Dalton, but knew that he was not the man whom he professed to be, and his suspicions were aroused. On seeing Dalton he assumed a high tone toward him, which he maintained till the last. Lady Dudley's emotion at the sight of Leon was a sore embarrassment, and all Dalton's plans seemed about to fall into confusion. The visits of the disguised Miss Fortescue were a puzzle; and as both Dalton and Lady Dudley looked upon this new visitor as an emissary of Leon's, they viewed these visits as they did those of Leon. For the first time Lady Dudley and Dalton were of opposite views. Dalton dreaded these visits, but his sister favored them. Her mother's heart yearned over Leon; and even if he did seek Edith's affections, it did not seem an undesirable thing. That, however, was a thing from which Dalton recoiled in horror.

At that time Reginald's strong will and clear intellect were sorely needed, but he was away on his Continental tour, and knew nothing of all these occurrences till it was too late.

Thus nothing was left to Dalton but idle warnings, which Edith treated as we have seen. True, there was one other resource, and that was to tell her all; but this he hesitated to do. For years he had hoped to redeem himself. He had looked forward to the day when his name should be freed from stain, and he still looked forward to that day when he might be able to say, "Here, my beloved daughter, my name is free from stain; you can acknowledge me without shame."

But Edith's opposition, and the plans of Leon, and the absorption of Lady Dudley's sympathies in the interests of her son, all destroyed Dalton's chances. He could only watch, and hear from his faithful Hugo accounts of what was going on. Thus he was led into worse and worse acts, and by misunderstanding Edith at the outset, opened the way for both himself and her to many sorrows.

After the terrible events connected with the mysterious departure of Leon and the arrest of Edith, Dalton had at once written to Reginald. He had been ill in the interior of Sicily—for his testimony at the trial had been in part correct. Dalton's letter was delayed in reaching him, but he hurried back as soon as possible. Relying on his extraordinary resemblance to Leon, Dalton had urged him to personify the missing man, and this he had consented to do, with the success which has been described. His chief motive in doing this was his profound sympathy for Dalton, and for Edith also, whom he believed to have been subjected to unfair treatment. That sympathy which he had already felt for Edith was increased when he saw her face to face.

All this was not told to Edith at once, but rather in the course of several conversations. Already in that interview in the prison her father had explained to her his motives in acting as he had, and this fuller confession only made those motives more apparent. In Edith this story served only to excite fresh grief and remorse. But Dalton showed so much grief himself that Edith was forced to restrain such feelings as these in his presence. He took all the blame to himself. He would not allow her to reproach herself. He it was, he insisted, who had been alone to blame in subjecting a generous, high-spirited girl to such terrible treatment—to imprisonment and spying and coercion. So great was his own grief that Edith found herself forced from the position of penitent into that of comforter, and often had to lose sight of her own offenses in the endeavor to explain away her own sufferings.

And thus, where there was so much need of mutual forgiveness and mutual consolation, each one became less a prey to remorse.

In the joy which he felt at thus gaining at last all his daughter's love, especially after the terrible misunderstanding that had divided her from him, Dalton had no thought for those grave dangers which surrounded both her and him. But to Edith these dangers still appeared, and they were most formidable. She could not forget that she was still liable to arrest on the most appalling of accusations, and that her father also was liable to discovery and re-arrest. Reginald had tried to banish her fears and inspire her with hope; but now that he was no longer near, her position was revealed, and the full possibility of her danger could no longer be concealed.

Danger there indeed was, danger most formidable, not to her only, but to all of them. Coward Sir Lionel might be, but a coward when at bay is dangerous, since he is desperate. Sir Lionel also was powerful, since he was armed with all the force that may be given by wealth and position, and in his despair his utmost resources would undoubtedly be put forth. Those despairing efforts would be aimed at all of them—all were alike threatened: herself on the old charge, her father as an escaped convict, and Reginald as a perjurer and a conspirator against the ends of justice. As to Lady Dudley, she knew not what to think, but she was aware of Reginald's fears about her, and she shared them to the fullest extent.

In the midst of all this Edith received a letter from Miss Plympton. She was just recovering, she said, from a severe illness, consequent on anxiety about her. She had heard the terrible tidings of her arrest, but of late had been cheered by the news of her release. The letter was most loving, and revealed all the affection of her "second mother." Yet so true was Miss Plympton

to the promise which she had made to Mr. Dalton, that she did not allude to the great secret which had once been disclosed to her. Edith read the letter with varied feelings, and thought with an aching heart of her reception of that other letter. This letter, however, met with a different fate. She answered it at once, and told all about her father, concluding with the promise to go and visit her as soon as she could.

And now all her thoughts and hopes were centred upon Reginald. Where was he? Where was Lady Dudley? Had he found Leon? What would Sir Lionel do? Such were the thoughts that never ceased to agitate her mind.

He had been gone a whole week. She had heard nothing from him. Accustomed as she had been to see him every day for so long a time, this week seemed prolonged to the extent of a month; and as he had promised to write her under any circumstances, she could not account for his failure to keep that promise. His silence alarmed her. As day succeeded to day, and still no letter came, she became a prey to all those fearful fancies which may be raised by a vivid imagination, when one is in suspense about the fate of some dearly loved friend.

Her father, whose watchful love made him observant of every one of her varying moods, could not avoid noticing the sadness and agitation of her face and manner, and was eager to know the cause. This, however, Edith's modesty would not allow her to explain, but she frankly confessed that she was anxious. Her anxiety she attributed to her fears about their situation, and her dread lest something might be found out about the imposture of Reginald, or about her father's real character and personality. The fear was not an idle one, and Dalton, though he tried to soothe her, was himself too well aware of the danger that surrounded both of them to be very successful in his efforts.

All this time a steady improvement had been taking place in Dalton's health, and his recovery from his illness was rapid and continuous. It was Edith's love and care and sympathy which thus gave strength to him, and the joy which he felt in her presence was the best medicine for his afflictions.

Thus one day he was at last able to venture outside. It was something more than a week since Reginald had left. Edith was more anxious than ever, but strove to conceal her anxiety and to drown her own selfish cares under more assiduous attentions to that father whose whole being now seemed so to centre upon her. For this purpose she had persuaded him to leave the Hall, and come forth into the grounds; and the two were now walking in front of the Hall, around the pond, Edith supporting her father's feeble footsteps, and trying to cheer him by pointing out some improvements

which ought to be made, while the old man, with his mind full of sweet peace, thought it happiness enough for him to lean on her loving arm and hear her sweet voice as she spoke those words of love which for so many years he had longed to hear.

In the midst of this they were startled by the approach of several men.

Visitors were rare at Dalton Hall. Before the recent troubles they had been prohibited, and though during Dalton's illness the prohibition had been taken off, yet there were few who cared to pass those gates. Upon this occasion the approach of visitors gave a sudden shock to Edith and her father, and when they saw that the chief one among those visitors was the sheriff, that shock was intensified.

Yes, the moment had come which they both had dreaded. All was known. The danger which they had feared was at hand, and each one trembled for the other. Edith thought that it was her father who was sought after. Dalton shuddered as he thought that his innocent daughter was once more in the grasp of the law.

The sheriff approached, followed by three others, who were evidently officers of the law. Dalton and Edith stood awaiting them, and Edith felt her father's hands clasp her arm in a closer and more tremulous embrace.

The sheriff greeted them with a mournful face and evident embarrassment. His errand was a painful one, and it was rendered doubly so by the piteous sight before him—the feeble old man thus clinging to that sad-faced young girl, the woe-worn father thus supported by the daughter whose own experience of life had been so bitter.

"My business," said the sheriff, "is a most painful one. Forgive me, Mrs. Dudleigh. Forgive me, Mr. Dalton. I did not know till now how painful it would be."

He had greeted them in silence, removing his hat respectfully, and bowing before this venerable old age and this sad-faced beauty, and then had said these words with some abruptness. And as soon as he named that name "Dalton," they both understood that he knew all.

"You have come for me?" said Dalton. "Very well."

A shudder passed through Edith. She flung her arms about her father, and placed herself before him, as if to interpose between him and that terrible fate which still pursued its innocent victim. She turned her large mournful eyes upon the sheriff with a look of silent horror, but said not a word.

"I can not help it," said the sheriff, in still deeper embarrassment. "I feel for you, for both of you, but you must come with me."

"Oh, spare him!" cried Edith. "He is ill. He has just risen from his bed. Leave him

here. He is not fit to go. Let me nurse him."

The sheriff looked at her in increasing embarrassment, with a face full of pity.

"I am deeply grieved," he said, in a low voice, "but I can not do otherwise. I must do my duty. You, Mrs. Dudleigh, must come also. I have a warrant for you too."

"What!" groaned Dalton; "for her?"

The sheriff said nothing. The old man's face had such an expression of anguish that words were useless.

"Again!" murmured Dalton. "Again! and on that false charge! She will die! she will die!"

"Oh, papa!" exclaimed Edith. "Do not think of me. I can bear it. There is no danger for me. It is for you only that I am anxious."

"My child! my darling Edith!" groaned the unhappy father, "this is my work—this is what I have wrought for you."

Edith pressed her father to her heart. She raised her pale face, and, looking upward, sighed out in her agony of soul,

"O God! Is there any justice in heaven, when this is the justice of earth!"

Nothing more was said. No one had any thing to say. This double arrest was something too terrible for words, and the darkest forebodings came to the mind of each one of these unhappy victims of the law. And thus, in silence and in fear, they were led away—to prison and to judgment.

CHAPTER LIII.

THE BROTHERS.

ON leaving Dalton Hall Reginald went to the place mentioned by Miss Fortescue. It was on the railway, and was about four miles from Dudleigh Manor. Here he found Miss Fortescue.

She told him that she had tried to find Leon by making inquiries every where among his old haunts, but without any success whatever. At last she concluded that, since he was in such strict hiding, Dudleigh Manor itself would not be an unlikely place in which to find him. She had come here, and, after disguising herself with her usual skill, had made inquiries of the porter with as much adroitness as possible. All her efforts, however, were quite in vain. The porter could not be caught committing himself in any way, but professed to have seen nothing of the missing man for months. She would have come away from this experiment in despair had it not been for one circumstance, which, though small in itself, seemed to her to have very deep meaning. It was this. While she was talking with the porter a dog came up, which at once began to fawn on her. This amazed the porter, who did

not like the appearance of things, and tried to drive the dog away. But Miss Fortescue had in an instant recognized the dog of Leon, well-known to herself, and once a great pet.

This casual appearance of the dog seemed to her the strongest possible proof that Leon was now in that very place. He must have been left purposely in Dalton Park for a few days, probably having been stationed at that very spot which he kept so persistently. If so, the same one who left him there must have brought him here. It was inconceivable that the dog could have found his way here alone from Dalton Park. In addition to this, the porter's uneasiness at the dog's recognition of her was of itself full of meaning.

This was all that she had been able to find out, but this was enough. Fearful that Leon might suspect who she was, she had written to Reginald at once; and now that he had come, she urged him to go to Dudleigh Manor himself and find out the truth.

There was no need to urge Reginald. His anxiety about his mother was enough to make him anxious to lose no time, but the prospect of finding Leon made him now doubly anxious. It was already evening, however, and he would have to defer his visit until the following day.

At about nine o'clock the next morning Reginald Dudleigh stood at his father's gate—the gate of that home from which he had been so long an exile. The porter came out to open it, and stared at him in surprise.

"I didn't know you was out, Sir," he said.

Evidently the porter had mistaken him for Leon. This address assured him of the fact of Leon's presence. The porter was a new hand, and Reginald did not think it worth while to explain. He entered silently while the porter held the gate open, and then walked up the long avenue toward the manor-house.

The door was open. He walked in. Some servants were moving about, who seemed to think his presence a matter of course. These also evidently mistook him for Leon; and these things, slight as they were, assured him that his brother must be here. Yet in spite of the great purpose for which he had come—a purpose, as he felt, of life and death, and even more—in spite of this, he could not help pausing for a moment as he found himself within these familiar precincts, in the home of his childhood, within sight of objects so well remembered, so long lost to view.

But it was only for a few moments. The first rush of feeling passed, and then there came back the recollection of all that lay before him, of all that depended upon this visit. He walked on. He reached the great stairway. He ascended it. He came to the great hall up stairs. On one side was the

drawing-room, on the other the library. The former was empty, but in the latter there was a solitary occupant. He was seated at a table, writing. So intent was this man on his occupation that he did not hear the sound of approaching footsteps, or at least did not regard them; for even as Reginald stood looking at him, he went on with his writing. His back was turned toward the door, so that Reginald could not see his face, but the outline of the figure was sufficient. Reginald stood for a moment looking at him. Then he advanced toward the writer, and laid his hand upon his shoulder.

The writer gave a sudden start, leaped from his chair, and turned round. There was fear on his face—the fear of one who is on the look-out for sudden danger—a fear without a particle of recognition. But gradually the blankness of his terrified face departed, and there came a new expression—an expression in which there was equal terror, yet at the same time a full recognition of the danger before him.

It was Leon Dudleigh.

Reginald said not one word, but looked at him with a stern, relentless face.

As these two thus stood looking at one another, each saw in the other's face the marvelous resemblance to himself, which had been already so striking to others, and so bewildering. But the expression was totally different. Aside from the general air characteristic of each, there was the look that had been called up by the present meeting. Reginald confronted his brother with a stern, menacing gaze, and a look of authority that was more than the ordinary look which might belong to an elder brother. Leon's face still kept its look of fear, and there seemed to be struggling with this fear an impulse to fly, which he was unable to obey. Reginald looked like the master, Leon like the culprit and the slave.

Leon was the first to speak.

"You—here!" he faltered.

"Where else should I be?" said Reginald, in a stern voice.

"What do you want?" asked Leon, rallying from his fear, and apparently encouraged by the sound of his own voice.

"What do I want?" repeated Reginald. "Many things. First, I want you; secondly, my mother."

"You won't get any thing out of me," said Leon, fiercely.

"In the first place, the sight of you is one of the chief things," said Reginald, with a sneer. "After having heard your sad fate, it is something to see you here in the flesh."

"It's that infernal porter!" cried Leon, half to himself.

"What do you mean? Do you blame him for letting me in—*me*—Reginald Dudleigh—your elder brother?"

"You're disinherited," growled Leon.

"Pooh!" said Reginald. "How can the eldest son be disinherited? But I'm not going to waste time. I have come to call you to account for what you have done, and I have that to say to you which you must hear, and, what is more, you must obey."

If Leon's face could have grown whiter than it already was, it would have become so at these words. His fear seemed swallowed up in a wild overmastering rush of fury and indignation. He started back and seized the bell-rope.

"I don't know you!" he almost yelled. "Who are you?" Saying this he pulled the bell-rope again and again. "Who are you?" he repeated over and over again, pulling the bell-rope as he spoke. "I'll have you turned out. You're an infernal impostor! Who are you? I can prove that Reginald Dudley is dead. I'll have you turned out. I'll have you turned out."

While he was speaking, his frantic and repeated tugs at the bell had roused the house. Outside the rush of footsteps was heard, and soon a crowd of servants poured into the room.

"You scoundrels!" roared Leon. "What do you mean by letting strangers in here in this way? Put this fellow out! Put him out! Curse you! why don't you collar him and put him out?"

As the servants entered, Reginald turned half round and faced them. Leon shouted out these words, and shook his fist toward his brother, while the servants stared in amazement at the astonishing spectacle. The two brothers stood there before them, the one calm and self-possessed, the other infuriated with excitement; but the wonderful resemblance between them held the servants spell-bound.

As soon as he could make himself heard, Reginald spoke.

"You will do nothing of the kind. Most of you are new faces, but some of you remember me. Holder," said he, as his eyes, wandering over the faces before him, rested upon one, "don't you know your young master? Have you forgotten Reginald Dudley?"

As he said this an old man came forth from the rear and looked at him, with his hands clasped together and his eyes full of tears.

"Lord be merciful to us all," he cried, with a trembling voice, "if it beant Master Reginald hisself come back to life again, and me mournin' over him as dead! Oh, Master Reginald, but it's glad I am this day. And where have ye been?"

"Never mind, old man," said Reginald, kindly; "you'll know soon enough." Saying this, he shook the old man's hand, and then turned with lowering brow once more upon Leon.

"Leon," said he, "none of this foolery. You found out what I am when you were a

boy. None of this hysterical excitement. I am master here."

But Leon made no reply. With his face now on fire with rage, he retreated a few steps and looked under the table. He called quickly to something that was there, and as he called, a huge dog came forth and stood by his side. This dog he led forward, and pointed at Reginald.

The servants looked on with pale faces at this scene, overcome with horror as they saw Leon's purpose.

"Go," said Leon, fiercely, to Reginald, "or you'll be sorry."

Reginald said nothing, but put his hand into his breast pocket and drew forth a revolver. It was not a very common weapon in England in those days, but Reginald had picked one up in his wanderings, and had brought it with him on the present occasion. Leon, however, did not seem to notice it. He was intent on one purpose, and that was to drive Reginald away.

He therefore put his hand on the dog's head, and, pointing toward his brother, shouted, "At him, Sir!" The dog hesitated for a moment. His master called again. The huge brute gathered himself up. One more cry from the now frenzied Leon, and the dog gave a tremendous leap forward full at Reginald's throat.

A cry of horror burst from the servants. They were by no means oversensitive, but this scene was too terrible.

The dog sprang.

But at that instant the loud report of Reginald's revolver rang through the house, and the fierce beast, with a sharp howl, fell back, and lay on the floor writhing in his death agony. The wound was a mortal one.

Reginald replaced his pistol in his pocket.

"I'm sorry for the poor beast," said he, as he looked at the dog for a moment, "but I could not help it. And you," he continued, turning to the servants, "go down stairs. When I want you I will call for you. Holder will tell you who I am."

At this the servants all retreated, overawed by the look and manner of this new master.

The shot of the pistol seemed to have overwhelmed Leon. He shrank back, and stared by turns at Reginald and the dog, with a white face and a scowling brow.

After the servants had gone, Reginald walked up to him.

"I will have no more words," said he, fiercely. "I'm your master now, Leon, as I always have been. You are in my power now. You must either do as I bid you, or else go to jail. I have taken up all your notes; I have paid more than forty thousand pounds, and I now hold those notes of yours. I do not intend to let you go till you do what I wish. If you don't, I will take you from this place and put you in

jail. I have warrants all ready, and in the proper hands. The officers are waiting in the neighborhood. Besides these claims, I shall have charges against you of a graver kind; you know what, so that you can not escape. Now listen. I am your only creditor now, and your only accuser. You need not hide any longer, or fly from the country. Confess; come to terms with me, and you shall be a free man; refuse, and you shall suffer the very worst that the law inflicts. If you do not come to terms with me, you are lost. I give you only this chance. You can do nothing. You can not harm Miss Dalton now, for I have found you out, and your miserable trick is of no use any longer. Come, now; decide at once. I will give you just ten minutes. If you come to terms, you are safe; if not, you go to jail."

"Who'll take me?" said Leon, in a surly voice.

"I," said Reginald—"I, with my own hands. I will take you out of this place, and hand you over to the officers who are waiting not very far away."

Saying this, Reginald looked at his watch, and then replacing it, turned once more to Leon.

"Your tricks have failed. I will produce you as you are, and Miss Dalton will be safe. You'll have to explain it all in court, so you may as well explain it to me. I don't want to be hard with you. I know you of old, and have forgiven other villainies of yours. You can't take vengeance on any one. Even your silence will be of no use. You must choose between a confession to me now, or a general confession in court. Besides, even if you could have vengeance, it wouldn't be worth so much to a man like you as what I offer you. I offer you freedom. I will give you back all your notes and bonds. You will be no longer in any danger. More, I will help you. I don't want to use harsh measures if I can help it. Don't be a fool. Do as I say, and accept my offer. If you don't, I swear, after what you've done I'll show you no more mercy than I showed your dog."

Leon was silent. His face grew more tranquil. He was evidently affected by his brother's words. He stood, in thought, with his eyes fixed on the floor. Debt was a great evil. Danger was around him. Freedom was a great blessing. Thus far he had been safe only because he had been in hiding. Besides, he was powerless now, and his knowledge of Reginald, as he had been in early life, and as he saw him now, showed him that his brother always meant what he said.

"I don't believe you have those notes and bonds."

"How could I know unless I paid them? I will tell you the names concerned in most of them, and the amounts."

And Reginald thereupon enumerated several creditors, with the amounts due to each. By this Leon was evidently convinced.

"And you've paid them?" said he.

"Yes."

"And you'll give them to me?"

"I will. I am your only creditor now. I have found out and paid every debt of yours. I did this to force you to come to terms. That is all I want. You see that this is for your interest. More, I will give you enough to begin life on. Do you ask more than this?"

Leon hesitated for a short time longer.

"Well," said he at last, "what is it that you want me to do?"

"First of all I want you to tell me about that infernal trick of yours with—the body. Whose is it? Mind you, it's of no consequence now, so long as you are alive, and can be produced; but I wish to know."

With some hesitation Leon informed his brother. The information which he gave confirmed the suspicions of Miss Fortescue. He had determined to be avenged on Edith and her father, and after that night on which Edith had escaped he had managed to procure a body in London from some of the body-snatchers who supplied the medical schools there. He had removed the head, and dressed it in the clothes which he had last worn. He had taken it to Dalton Park and put it in the well about a week after Edith's flight. He had never gone back to his room, but had purposely left it as it was, so as to make his disappearance the more suspicious. He himself had contrived to raise those frequent rumors which had arisen and grown to such an extent that they had terminated in the search at Dalton Park. Anonymous letters to various persons had suggested to them the supposed guilt of Edith, and the probability of the remains being found in the well.

The horror which Reginald felt at this disclosure was largely mitigated by the fact that he had already imagined some such proceeding as this, for he had felt sure that it was a trick, and therefore it had only been left to account for the trick.

The next thing which Reginald had to investigate was the mock marriage. But here he did not choose to question Leon directly about Edith. He rather chose to investigate that earlier marriage with Miss Fortescue.

By this time Leon's objections to confess had vanished. The inducements which Reginald held out were of themselves attractive enough to one in his desperate position, and, what was more, he felt that there was no alternative. Having once begun, he seemed to grow accustomed to it, and spoke with greater freedom.

To Reginald's immense surprise and relief, Leon informed him that the marriage with

"THE FIERCE BEAST, WITH A SHARP HOWL, FELL BACK."—[SEE PAGE 367.]

Miss Fortescue was not a mock marriage at all. For once in his life he had been honest. The marriage had been a real one. It was only after the affair in the Dalton vaults that he had pretended that it was false. He did so in order to free himself from his real wife, and gain some control over the Dalton estate. The Rev. Mr. Porter was a *bona fide* clergyman, and the marriage had been conducted in a legal manner. He had found out that the Rev. Mr. Porter had gone to Scotland, and saw that he could easily deceive his wife.

"But," said Reginald, "what is the reason that your wife could never find him out? She looked over all the lists of clergymen, and wrote to all of the name of Porter. She could not find him."

"Naturally enough," said Leon, indifferently. "She supposed that he belonged to the Church, because he used the Church service; but he was a Presbyterian."

"Where is he now?"

"When last I heard about him he was at Falkirk."

"Then Miss Fortescue was regularly married, and is now your wife?"

VOL. XLIX.—No. 291.—25

"She is my wife," said Leon.

At this Reginald was silent for some time. The joy that filled his heart at this discovery was so great that for a time it drove away those other thoughts, deep and dread, that had taken possession of him. But these thoughts soon returned.

"One thing more," said he, in an anxious voice. "Leon, where is my mother?"

CHAPTER LIV.

THE SONS AND THEIR FATHER.

"WHERE is my mother?"

Such was Reginald's last question. He asked it as though Lady Dudleigh was only *his* mother, and not the mother of Leon also. But the circumstances of his past life had made his father and his brother seem like strangers, and his mother seemed all his own.

At this question Leon stared at him with a look of surprise that was evidently unfeigned.

"Your mother?" he repeated.

"I do not say *our* mother," said Reginald. "I say *my* mother. Where is she?"

"I swear I know nothing about her," said Leon, earnestly. "I have never seen her."

"You have never seen her?" repeated Reginald, in a tremulous voice.

"Never," said Leon; "that is, not since she left this place ten years ago."

"You saw her at Dalton Hall?" cried Reginald.

"At Dalton Hall? I did not," said Leon.

"Mrs. Dunbar, she called herself. You saw her often."

"Mrs. Dunbar! Good Heavens!" cried Leon, in unaffected surprise. "How was I to know that?"

Reginald looked at him gloomily and menacingly.

"Leon," said he, in a stern voice, "if you dare to deceive me about this, I will show no mercy. You must tell *all*—yes, *all*!"

"But I tell you I don't know any thing about her," said Leon; "I swear I don't. I'll tell every thing that I know. No such person has ever been here."

Reginald looked at his brother with a gloomy frown; but Leon's tone seemed sincere, and the thought came to him that his brother could have no reason for concealment. If Leon did not know, he would have to seek what he wished from another—his father. His father and his mother had gone off together; that father alone could tell.

"Where is Sir Lionel?" asked Reginald, as these thoughts came to him. He called him "Sir Lionel." He could not call him "father."

Leon looked at him with a strange expression.

"He is here," said he.

"Where shall I find him? I want to see him at once. Is he in his room?"

Leon hesitated.

"Quick!" said Reginald, impatiently. "Why don't you answer?"

"You won't get much satisfaction out of him," said Leon, in a peculiar voice.

"I'll find out what he knows. I'll tear the secret out of him," cried Reginald, fiercely. "Where is he? Come with me. Take me to him."

"You'll find it rather hard to get any thing out of him," said Leon, with a short laugh. "He's beyond even *your* reach, and your courts of law too."

"What do you mean?" cried Reginald.

"Well, you may see for yourself," said Leon. "You won't be satisfied, I suppose, unless you do. Come along. You needn't be alarmed. I won't run. I'll stick to my part of our agreement, if you stick to yours."

With these words Leon led the way out of the library, and Reginald followed. They went up a flight of stairs and along a hall to the extreme end. Here Leon stopped at a door, and proceeded to take a key from his

pocket. This action surprised Reginald. He remembered the room well. In his day it had not been used at all, except on rare occasions, and had been thus neglected on account of its gloom and dampness.

"What's the meaning of this?" he asked, gloomily, looking suspiciously at the key.

"Oh, you'll see soon enough," said Leon.

With these words he inserted the key in the lock as noiselessly as possible, and then gently turned the bolt. Having done this, he opened the door a little, and looked in with a cautious movement. These proceedings puzzled Reginald still more, and he tried in vain to conjecture what their object might be.

One cautious look satisfied Leon. He opened the door wider, and said, in a low voice, to his brother,

"Come along; he's quiet just now."

With these words he entered, and held the door for Reginald to pass through. Without a moment's hesitation Reginald went into the room. He took but one step, and then stopped, rooted to the floor by the sight that met his eyes.

The room was low, and had no furniture but an iron bed. There were two small, deep windows, over which the ivy had grown so closely that it dimmed the light, and threw an air of gloom over the scene.

Upon the iron bed was seated a strange figure, the sight of which sent a thrill of horror through Reginald's frame. It was a thin, emaciated figure, worn and bent. His hair was as white as snow; his beard and mustache were short and stubbly, as though they were the growth of but a few weeks; while his whiskers were bushy and matted together.

Over this figure a quilt was thrown in a fantastic manner, under which appeared a long night-gown, from which thin bare legs protruded, with bare, gaunt, skeleton-like feet.

As he sat there his eyes wandered about on vacancy; a silly smile was on his white, worn face; he kept muttering to himself continually some incoherent and almost inaudible sentences; and at the same time his long bony fingers kept clawing and picking at the quilt which covered him.

At first Reginald could scarce believe what he saw; but there was the fact before his eyes, and the terrible truth could not be denied that in this wretched creature before him was the wreck of that one who but a short time before had seemed to him to be a powerful and unscrupulous villain, full of the most formidable plans for inflicting fresh wrongs upon those whom he had already so foully injured. Reginald had seen him for a few moments at the trial, and had noticed that the ten eventful years for which they had been parted had made but little difference in his appearance. The casual

"UPON THE IRON BED WAS SEATED A STRANGE FIGURE."

glimpses of him which he afterward had caught showed some change, but nothing very striking; but now the change was terrible, the transformation was hideous; the strong man had become a shattered wreck; the once vigorous mind had sunk into a state of helpless imbecility and driveling idiocy.

Leon shut the door, and turning the key, stood looking on. The slight noise which he made attracted the wandering gaze of the madman. He started slightly, and stood up, wrapping the quilt carefully around him. Then, with a silly smile, he advanced a few paces.

"Well, Dr. Morton," he said, in a weak, quavering voice, "you have received my letter, I hope. Here is this person that I wrote about. Her name is Mrs. Dunbar. She is an old dependent. She is mad—ha, ha!—mad. Yes, mad, doctor. She thinks she is my wife. She calls herself Lady Dudleigh. But, doctor, her real name is Mrs. Dunbar. She is mad, doctor—mad—mad—mad. Ha, ha, ha!"

At these words a terrible suspicion came to Reginald's mind. The madman had still prominent in his thoughts the idea which he had lately been carrying out. Could there be any truth in these words, or were they mere fancies? He said not a word, but looked and listened in anxious silence. He had felt a moment's pity for this man, who, wretch though he had been, was still his father; but now his mother's image rose be-

fore him—his mother, pale, suffering, and perhaps despairing—and in his eager desire to learn her fate, all softer feelings for his father died out.

"You must keep her, Dr. Morton," said Sir Lionel, in the same tone. "You know what she wants. I will pay you well. Money is no object. You must keep her close—close—yes, close as the grave. She is incurable, doctor. She must never come out of this place with her mad fancies. For she is mad—mad—mad—mad—mad. Oh yes. Ha, ha, ha!"

Sir Lionel then smiled as before, and chuckled to himself, while a leer of cunning triumph flashed for a moment from his wandering eyes. "Trapped!" he ejaculated, softly. "Trapped! The keeper! The keeper trapped! She thought she was my keeper! And so she was. But she was trapped—yes, trapped. The keeper trapped! Ha, ha, ha! She thought it was an inn," he continued, after a brief silence, in which he chuckled to himself over the remembrance of his scheme; "and so she was trapped. The keeper was caught herself, and found herself in a mad-house! And she'll never get out—never! She's mad. They'll all believe it. Mad! Yes, mad—and in a mad-house! Ha, ha, ha! There's Lady Dudleigh for you! But she's Mrs. Dunbar now. Ha, ha, ha!"

Reginald's eagerness to learn more was uncontrollable. In his impatience to find

out, he could no longer wait for his father's stray confessions.

"What mad-house? Where?" he asked, eagerly and abruptly.

Sir Lionel did not look at him. But the question came to him none the less. It came to him as if it had been prompted by his own thoughts, and he went on upon the new idea which this question started.

"She saw me write it, too—the letter—and she saw me write the address. There it was as plain as day—the address. Dr. Morton, I wrote, Lichfield Asylum, Lichfield, Berks. But she didn't look at it. She helped me put it in the post-office. Trapped! trapped! Oh yes—the keeper trapped!" he continued. "She thought we were going to Dudleigh Manor, but we were going to Lichfield Asylum. And we stopped there. And she stopped there. And she is there now. Trapped! Ha, ha, ha! And, my good doctor, keep her close, for she's mad. Oh yes—mad—mad—mad—and very dangerous!"

The wretched man now began to totter from weakness, and finally sat down upon the floor. Here he gathered his quilt about him, and began to smile and chuckle and wag his head and pick at his fantastic dress as before. The words which he muttered were inaudible, and those which could be heard were utterly incoherent. The subject that had been presented to his mind by the entrance of Reginald was now forgotten, and his thoughts wandered at random, like the thoughts of a feverish dream, without connection and without meaning.

Reginald turned away. He could no longer endure so painful a spectacle. He had been long estranged from his father, and he had come home for the sake of obtaining justice from that father, for the sake of the innocent man who had suffered so unjustly and so terribly, and whom he loved as a second father. Yet here there was a spectacle which, if he had been a vengeful enemy, would have filled him with horror. One only feeling was present in his mind now to alleviate that horror, and this was a sense of profound relief that this terrible affliction had not been wrought by any act of his. He had no hand in it. It had come upon his father either as the gradual result of years of anxiety, or as the immediate effect of the sudden appearance of Dalton and his wife.

But for these thoughts there was no leisure. His whole mind was filled with but one idea—his mother. In a few moments they were outside the room. The madman was left to himself, and Reginald questioned Leon about him.

"I have heard all this before," said Leon. "He came home very queer, and before a week was this way. I put him in there to keep him out of mischief. I feed him myself. No one else goes near him. I've had a doc-

tor up, but he could do nothing. He has often talked in this way about trapping some one, but he never mentioned any name till to-day. He never did—I swear he never did. I swear I had no idea that he had reference to my—to Lady Dudleigh. I thought it was some crazy fancy about Mr. Dalton—some scheme of his for 'trapping' him. I did—I swear."

Such was Leon's statement, extorted from him by the fiercest of cross-questionings on the part of Reginald, accompanied by most savage threats.

Leon, however, swore that he thought it referred to a scheme of his father's to "trap" Dalton, and shut him up in a mad-house. If it was true that no names had been mentioned, Reginald saw that it was quite possible that Leon might have supposed what he said, though his knowledge of his brother did not lead him to place any particular confidence in his statement, even when accompanied by an oath.

It now remained to find out, without delay, the place which the madman had revealed. Reginald remembered it well: *Dr. Morton, Lichfield Asylum, Lichfield, Berks.* Leon also said that the same name had been always mentioned. There could not, therefore, be any mistake about this, and it only remained to find out where it was.

Leon knew both the man and the place, and told all that he knew, not because he had a particle of affection for his mother, but because he wished to satisfy Reginald, so as to gain that freedom which his brother only could give him. He had been the intimate confidant of his father, and this Dr. Morton had been connected with them previously in another affair. He was therefore able to give explicit information about the place, and the quickest manner of reaching it.

Reginald set off that very day.

"It will be better for you to stay here," said he to Leon, as he was leaving, in a significant tone.

"Oh, I'll stay," said Leon. "If you act square, that's all I want. Give me those notes and bonds, and I'll never trouble you or yours again."

Before leaving he obtained from Leon further information about his first marriage with Miss Fortescue. This he communicated to Leon's wife, whom he found waiting for him in great suspense. As soon as she heard it she set out for London to find the witness mentioned by Leon; after which she intended to go to Falkirk in search of the clergyman.

After parting with Leon's wife, Reginald left by the first train, *en route* for Dr. Morton's asylum at Lichfield, in accordance with Leon's directions. On the middle of the following day he reached the place.

He came there accompanied by two officers of the law, who had a warrant for the

arrest of Dr. Morton on a charge of conspiracy and illegal imprisonment. That distinguished physician came down to see his visitors, under the impression that one of them was a patient, and was very much surprised when he found himself under arrest. Still more surprised was he when Reginald asked him, fiercely, after Lady Dudleigh.

In a few moments the door of Lady Dudleigh's room was flung open, and the almost despairing inmate found herself in the arms of her son. She looked feeble and emaciated, though not so much so as Reginald had feared. She had known too much of the sorrows of life to yield altogether to this new calamity. Her chief grief had been about others, the fear that they might have become the prey of the villain who had shut her in here; but in spite of her terrible suspense, she struggled against the gloom of her situation, and tried to hope for release. It had come at last, and with it came also the news that there was no longer any need for her or for Reginald to take any proceedings against the guilty husband and father, since he had been struck down by a more powerful arm.

When they went away, Dr. Morton was taken away also. In due time he was tried on the charge above mentioned. He showed, however, that Lady Dudleigh had been put under his care by Sir Lionel himself, and in the usual way; that Sir Lionel had specified the nature of her insanity to consist in the belief that she was his wife, and that so long as she maintained that belief he thought her actually insane. He showed that, apart from that confinement which he had deemed requisite, she had been treated with no unnecessary cruelty. Many other things he also showed, by means of which he contrived to obtain an acquittal. Still, so much came out in the course of the trial, and so very narrow was his escape, and so strong was his fear of being re-arrested on other charges, that he concluded to emigrate to another country, and this he did without delay.

But Reginald returned at once with his mother to Dudleigh Manor. Here Lady Dudleigh for a few days sank under the effects of the accumulated troubles through which she had passed, and when at length she was able to move about, Sir Lionel was the first one of whom she thought, and she at once devoted herself to him. But the wretched man was already beyond the reach of her care. His strength was failing rapidly; he refused all nourishment; his mind was a hopeless wreck; he recognized no one; and all that was now left to the wife to do was to watch over him and nurse him as patiently as possible until the end, which she knew must be near.

In the excitement consequent upon his first return, his interviews with Leon and Sir Lionel, his rescue of Lady Dudleigh, and

his deep anxiety about her after her release, Reginald had sent no word to Edith of any kind. This arose neither from neglect nor forgetfulness, but because his surroundings were too sad, and he had not the heart to write to her until some brighter prospect should appear. His mother's short illness at first alarmed him; but this passed away, and on her recovery he felt sufficiently cheerful to send to Edith an account of all that had occurred.

Ten days had passed since he parted with her. On the day after he wrote to her he received a letter from her. It was the first communication that he had received.

That letter conveyed to him awful intelligence. It informed him of the arrest of Edith and Frederick Dalton.

CHAPTER LV.

CONCLUSION.

THIS intelligence was so terrible and so unexpected that for some time he felt overwhelmed with utter horror. Then a dark suspicion came to him that this was the work of Leon, who, enraged at his baffled schemes, had dealt this last blow upon those whom he had already so deeply wronged. This suspicion roused the utmost fury of Reginald's nature, and he hurried forth at once to seek his brother.

He found him sauntering up and down in front of the house. Leon had remained here ever since his interview with Reginald, in accordance with his promise. As he now saw his brother approach, he started, and looked at him with an expression of astonishment not unmingled with terror.

Without any preliminaries, Reginald at once assailed him with the most vehement denunciations, and in a few burning words, full of abhorrence and wrath, he accused him of this new piece of villainy.

"You're wrong—you're wrong—you're altogether wrong!" cried Leon, eagerly. "I have done nothing—I swear I've done nothing! I've never left the place."

"You've sent word!" cried Reginald, furiously.

"I have not—I swear I haven't!" said Leon. "I haven't written a line to any one. I've had no communication whatever with a single soul."

"It's your work, and yours only!" cried Reginald; "and, by Heaven, you shall suffer for it! You've broken the agreement between us, and now I'll show you no mercy!"

"I haven't broken it! I swear by all that's most holy!" cried Leon, earnestly. "I see how it is. This is merely the result of the old rumors—the old work going on. I swear it is! Besides, what danger can

happen to Miss Dalton? I need only show myself. I'll go there with you at once. Can I do more than that? When I am seen alive, there is no more danger for her. Do you think I'd be such an infernal fool as to work out such a piece of spite, which I would know to be utterly useless? No. I only want to wind up the whole affair, and get my freedom. I'll go there with you or without you, and make it all right so far as she is concerned. There. Can I do any thing more?"

These words mollified Reginald in some degree, since they showed that, after all, this new trouble might, as Leon said, have arisen from old machinations, as their natural result, and did not necessarily involve any new action on Leon's part.

"I'll go," said Reginald, "and you shall go with me; but if I find that you have played me false this time, by Heaven, I'll crush you!"

Reginald, accompanied by Leon, hurried off at once to the succor of Edith, and arrived there on the following day. It was the fifth day of their imprisonment, but, to Reginald's immense relief, this new misfortune did not seem to have affected either of them so painfully as he had feared. For to Edith imprisonment was familiar now, and this time she had the discovery of Miss Fortescue to console her. Besides, she had her father to think of and to care for. The kindness of the authorities had allowed the two to be together as much as possible; and Edith, in the endeavor to console her father, had forced herself to look on the brighter side of things, and to hope for the best.

Dalton, too, had borne this arrest with equanimity. After the first shock was past he thought over all that was most favorable to escape rather than the gloomier surroundings of a situation like his. For himself he cared nothing. To be brought once more before a court of law was desirable rather than otherwise. His arrangements for his own vindication were all complete, and he knew that the court could only acquit him with honor. But about Edith he felt an anxiety which was deeper than he cared to show, for he did not know how the evidence against her would be received.

The arrival of Reginald, however, drove away every fear. He brought the missing man himself. All was now explained. The news ran through the community like wildfire, and public opinion, which had so severely prejudged Edith, now turned around with a flood of universal sympathy in her favor. Some formalities had to be undergone, and then she was free.

The circumstances that had brought to light Edith's innocence served also to make known the innocence, the wrongs, and the sufferings of the father. The whole story of Dalton was made public through the ex-

ortions of Reginald, and society, which had once condemned him, now sought to vindicate him. But the work of vindication had to be done elsewhere, and in a more formal manner. Until then Dalton had to wait; yet this much of benefit he received from public sympathy, that he was allowed to go free and live at Dalton Hall until the law should finally decide his fate.

Long before that decision Sir Lionel passed away from the judgment of man to answer for his crimes at a higher tribunal. He passed away in his madness, unconscious of the presence of that wife whom he had doomed to exile, and who now, his only attendant, sought to soothe the madman's last moments. But the measures that were taken to vindicate Dalton were successful. Lady Dudleigh and Reginald could give their evidence in his favor without the fear of dealing out death to one so near as Sir Lionel. Death had already come to him, sent by a mightier power, and Dalton's vindication involved no new anguish. So it was that Frederick Dalton was at length cleared of that guilt that had so long clung to him; and if any thing could atone for his past sufferings, it was the restoration of his name to its ancient honor, the public expression of sympathy from the court and from the world, and the deep joy of Edith over such a termination to his sorrows.

But this was a work of time. Before this Reginald and Edith were married. They lived at Dudleigh Manor, for the associations of Dalton Hall were too painful, and Edith did not care to make a home in her old prison-house. To her father, too, the Hall was distasteful as a residence, and he made his abode with his daughter, who was now the only one on earth in whom he took any interest. But Dalton Hall was not untenanted. Lady Dudleigh lived there in the old home of her childhood, and passed her time in works of charity. She made an effort to reclaim Leon, and succeeded in keeping him with her for a few weeks; but the quiet life soon proved intolerable, and he wandered away at length to other scenes.

Reginald had dealt faithfully and even generously by him. After all his crimes and villainies, he could not forget that he was his brother, and he had done all in his power to renew his life for him. He had given him all the claims which he had collected, and thus had freed him from debt. He had also given him money enough to enable him to start afresh in life. But the money was soon gone, and the habits which Leon had formed made any change for the better impossible. He wandered away into his former associations and became a miserable vagabond, constantly sinking down deep into misery, to be saved for a time by his mother's assistance, but only to sink once more.

Mention must be made of two others before this story closes.

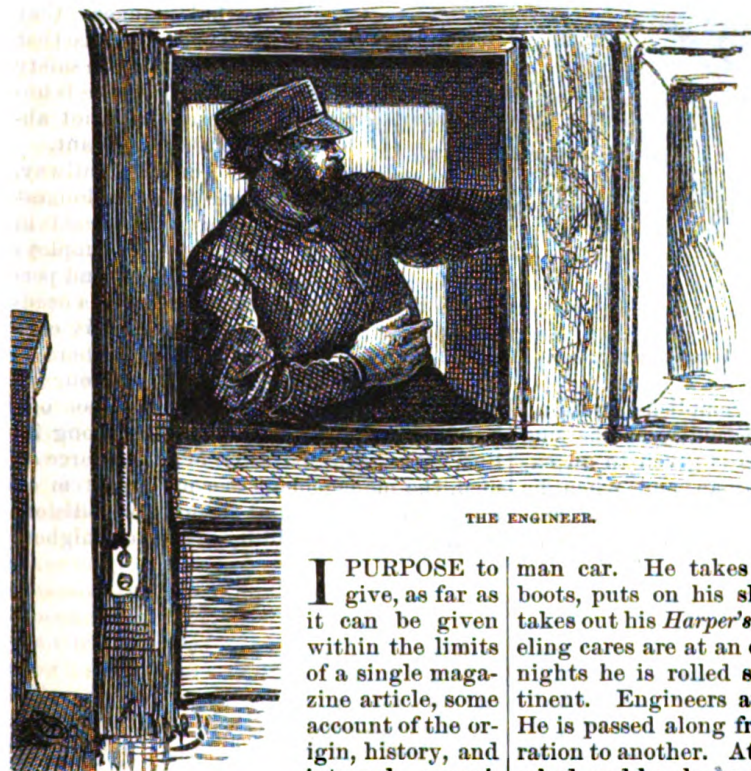

One of these is Leon's wife. She went away from Dudleigh Manor to Scotland in search of the clergyman who had married her. She succeeded in finding him, and in obtaining from him a formal certificate of her marriage. This, however, was not for the purpose of acquiring any hold whatever upon Leon, but rather for the sake of her own honor, and also out of regard for Edith, whom she wished to free from the last shadow of that evil which her own deceit had thrown upon the innocent girl. After this she was satisfied. She did not seek Leon again, nor did she ever again see him. She

retired from the world altogether, and joining a sisterhood of mercy, devoted the remainder of her life to acts of charity and humanity.

Last of all remains Miss Plympton, with whom this story began, and with whom it may end. That good lady recovered from the illness into which she had fallen on account of her anxiety about Edith, and was able to visit her not long after her release from her last imprisonment. She had given up her school; and as she had no home, she yielded to Edith's affectionate entreaties, and found a new home with her, where she passed the remainder of her days.

THE END.

THE AMERICAN RAILROAD.

THE ENGINEER.

I PURPOSE to give, as far as it can be given within the limits of a single magazine article, some account of the origin, history, and internal organization of the American railroad. Into the question so abundantly discussed of late in the public prints and periodicals, and now even in political caucuses and conventions, concerning the mutual rights and obligations of the railroad companies and the public, I shall not enter. Yet it may contribute something to a better understanding, and so indirectly to a solution of that problem, to have a clear idea of what a railroad corporation is, what are the hazards, what the toils, what the duties, difficulties, and dangers, of those who are connected with, and who have done most to create, develop, and carry on, these great highways of the present century,

the arteries which supply the whole body politic with its vital circulation—trade and commerce.

The traveler going West steps to the ticket office of the Pennsylvania, the Erie, or the New York Central Railroad. He purchases his ticket for San Francisco. He gives his trunk to a baggage-master, gets for it a little piece of metal, and sees and cares for it no more. A porter shows him his place in the Pull-

man car. He takes his seat, pulls off his boots, puts on his slippers, opens his bag, takes out his *Harper's Magazine*, and his traveling cares are at an end. For six days and nights he is rolled swiftly across the continent. Engineers and conductors change. He is passed along from one railroad corporation to another. At night his seat becomes a bed, and he sleeps as quietly, or nearly so, as if in his own bed at home. He traverses broad plains, passes over immense viaducts, whirls swiftly over mountain torrents on iron bridges, climbs or pierces mountains; but he never leaves his parlor; if need be, his meals are brought to him where he sits; and at length, after a week of luxurious though weary traveling, in which he has been in the keeping of half a dozen different companies, and has traversed over three thousand miles of country, part of it uninhabited and desolate, he is set down in the station at San Francisco. He looks at the clock in the station-room, compares it with the time-table in his hand, and finds that

GEORGE STEPHENSON.

his journey has been accomplished with all the regularity and punctuality of the sun. His little piece of brass is given to an express agent or a hackman, and when he reaches his hotel, the trunk which he surrendered in New York is in the great hall awaiting him. It seems a very simple business; and if perchance through all this journey he finds the dinner at one waiting-place cold, or the conductor on one part of his trip discourteous, or the train stopped at any point in the long ride beyond his expectations, or his arrival at his destination delayed beyond the appointed hour, he is very apt to grumble, inwardly if not vocally. How much money has been put into this long line of rail; how much has been sunk in unsuccessful experiments; how many rich men have been ruined before the

work was done; how many sleepless nights surveyors and contractors have spent in providing this marvelous highway; how intricate and involved is the system of copartnership that is necessary to such a continuous transportation "without change of cars;" what a gigantic undertaking it is to administer this system, with its thousands of employes; how wide awake the engineers have been that the traveler may sleep; what dangers they have had to face that he may ride in safety—of all this he is unconscious, if not absolutely ignorant.

The Erie Railway, one of the longest lines of railroad in the world, employs fifteen thousand persons in various occupations. It is estimated that there is scarcely an hour of the day or night when there are not one hundred trains in actual running along its line. The administration of such a force of men, the management of such a system of railroad trains, without clashing or collision, requires executive ability of the very highest

THE NO. 1 ENGINE AT DARLINGTON.

THE "ROCKET."

order. If, Sir, you think it easy, count up the difficulties you have with your own Irish gardener in the administration of your country place, with its horse and cow; then multiply those difficulties by fifteen thousand, and you have the problem of an American railroad president.

The railroad system has not yet reached its semi-centennial. The 27th of September, 1825, may be regarded as its birthday, if it can be said to have had a day of birth. The railroad from Stockton to Darlington, in England, had been completed. On the urgent recommendations of George Stephenson the original plan of a wooden tramway had been abandoned, and an iron railway had been substituted. Yielding to his persistency, the directors of this new-fangled and much ridiculed enterprise permitted him to put upon the road, which they had intended only for horse draught, a steam locomotive. A great concourse of people assembled on the occasion of its opening, to glorify the success or ridicule the failure of the man whom the multitude were equally ready to can-

onize as the wisest or to condemn as the craziest man in all England. Thoroughness was above all qualities a characteristic of this father of railroads; hence, fortunately for his reputation, and yet more fortunately for his work, he needed only an opportunity to demonstrate the practicability of his plans. On the trial day he was always ready; no overlooked or neglected point ever brought him or his work into disrepute. A long procession of vehicles was formed—six wagons loaded with coals and flour, a covered coach containing directors and passengers, twenty-one coal

LOCOMOTIVE OF TO-DAY.

THE CAB OF THE ENGINE AT NIGHT.

wagons fitted up for and crowded with passengers, and six more wagons loaded with coals. Locomotive engine No. 1, driven by George Stephenson, headed the procession. A man on horseback rode before, and heralded the coming of the train. A great concourse of people, on horseback and on foot, accompanied it; but not long. The horseman who heralded was compelled to leave the track; the accompanying horsemen and the runners were distanced; and the first train that ever carried passengers finished its journey at the rate of from twelve to fifteen miles an hour.

It is not easy for us, with the whistle of the locomotive as familiar in our ears as the sound of the church bell, to conceive the difficulties under which the early promoters of railroads labored. The necessity of making a comparatively level roadway was apparent from the first. How this was to be accomplished was not so evident. That the returns in traffic would ever compensate for the prodigious expense involved was believed by few. That steam could ever be

practically employed for draught in such a way as to compete in speed and utility with horses was ridiculed by almost every one. This ridicule was not confined to un-intelligent and ignorant minds. The ablest engineers combined with the common people in declaring it impossible. They demonstrated its impossibility. Scientific men declared that it could not be done. Practical men declared that the dangers would render it inconceivably hazardous to public safety, even if the dream of the visionary enthusiasts could be realized. Political economists cried out against an imaginary reform, the result of which would be to throw out of employment drivers of stage-coaches and teamsters and innkeepers, and the whole class of artisans and traders whom the

then common methods of traffic kept busy. One of the ablest of English quarterlies, one of the warmest friends of the movement, thus ridiculed the absurd expectations of some of its sanguine promoters: "What can be more palpably absurd and ridiculous than the prospect held out of locomotives traveling twice as fast as stage-coaches? We should as soon expect the people of Woolwich to suffer themselves to be fired off upon one of Congreve's ricochet rockets as trust themselves to the mercy of such a machine going at such a rate." A Parliamentary opponent to the first great passenger line, the Manchester and Liverpool, declared that it would be impossible to work the engine against a gale of wind. Another prophesied that it would deteriorate land in the vicinity of Manchester alone to the extent of £20,000. When Parliamentary opposition was at length silenced by argument or hushed by money—the charter of the road cost, in immaculate England, forty years before the days of *Crédit Mobilier*, £27,000—opposition and obstacle had but

PORTAGE BRIDGE.

begun. The surveyors were mobbed by the people; the work was impeded when commenced; engineers had to learn their art by experience, and of course by one that was prolonged and costly. No less resolute and determined a will, no less practical and sagacious an engineer, than George Stephenson could have carried to its consummation the first great trunk line. It was hard for him, but it was fortunate for the world, that this road presented so many of the difficulties with which in all districts railroad engineering has to cope. On the thirty miles between Liverpool and Manchester there were under or over the railroad sixty-three bridges. The stone cutting at Olive Mount is to-day one of the most formidable in the

world: it is two miles long, and in some places one hundred feet deep. The roadway across Chat Moss is one of the wonders of railway enterprise. Considering the circumstances under which it was devised and executed, it deserves to rank with the chiefest engineering exploits of the century.

But if the railroad in its inception met with great impediments from its foes, their opposition is not to be wondered at. For the schemes of the first railroad men were often visionary and impracticable. Those that stood the test of time remain; the others are forgotten. That the world did not at first discriminate between them is not surprising. The curiously wild attempt to construct the Erie Railway on piles, and so save the expense of embankments, is but one of the numerous costly experiments which rendered no other service to any one than the experience they brought. How singularly crude were the ideas of the railroad pioneers receives a still more curious illustration in the history of the Baltimore and Ohio Railroad, one of the earliest constructed on American soil. The first locomotive

was made with sails, to be propelled by the wind, like a ship. At the famous trial of locomotives at Liverpool in 1829 four engines put in an appearance. Of the four George Stephenson's Rocket was the only one that achieved any thing. Of the others two broke utterly down; the third could attain at its utmost but a speed of five or six miles an hour. In number the failures preponderated; it is not strange that for a time they preponderated in the influence which they exerted on the public mind.

It will render our task of tracing the history and describing the organization of the American railroad simpler if we take a single one as illustrative of the entire system. For that purpose I have chosen the Erie Railway. It is one of the longest, as it is one of the oldest, on the continent. In its early history it met and conquered obstacles which might well have sufficed to crush an enterprise financially much stronger. A large part of its course lay through an absolutely trackless wilderness. To reach its destination it was necessary to climb a mountain range over 1700 feet above the level of the

sea, and make its way along the course of a stream which flows between almost precipitous walls of rock. As a monument of engineering skill it is without a superior to-day in America—certainly if the times and circumstances in which it was constructed be taken into account.

The first step in the construction of a railroad is its conception. The originator of a successful railroad must be something of a prophet. He must not only be wise to see, but sagacious to foresee.

TAKING A LEVEL.

For railroads do not merely supply a demand which already exists; they create it. The railroad originator always appears to be an enthusiast to his fellows. The first successful English railroad ran from Stockton to Darlington. The latter town lies in the heart of one of the richest mineral fields in the north of England. The former is situated near the mouth of the Tees, and is the nearest sea-port town. How little even the founders conceived the business which this line would build up is indicated by the fact that they counted on a coal traffic of 165,000 tons, and that in 1860 that traffic had actually grown to over 3,000,000 tons annually! They consented without protest to a clause in their charter limiting their freight charges on coal for exportation to a half-penny per mile, for that branch of their trade they regarded as entirely subsidiary. Yet in the course of a very few years it constituted the main bulk of their business. In ten years this railroad had converted a solitary farm-house in the midst of unproductive pasture land into a town of six thousand inhabitants, which has since more than quadrupled in size. Of course we could cite abundant illustrations more striking from the history of American railroads. We cite this because it was prophetic of all the subsequent history of railroad enterprise.

The conception of a railroad is often a flash of intuition in the individual mind. But before the originator can realize his vision he must succeed in inspiring other minds with his own conviction and enthusiasm, and this is always a work of time. Of the prenatal history of the railroad the Erie is an illustrious example.

In 1779 General James Clinton and General Sullivan, at the close of an expedition against the Iroquois Indians in the southern tier of counties of New York State, proposed to Congress the construction of what they termed an Appian Way from the city of New York to Lake Erie. The great inland seas which we call lakes, and which have done so much to develop the rich but formerly inaccessible West, were at that time separated from the sea-coast by the mountain range which stretches, with here and there a break, from the Gulf States to the river St. Lawrence. The great West, the future but then unrecognized granary of the nation, was more remote from the Atlantic than is to-day the empire of Japan. To the Clintons New York owes the two great highways which have rendered her chief city the metropolis of the nation—the Erie Canal and the Erie Railway. The Appian Way never got further in construction than an ineffectual application to Congress for an appropriation. But the dream of the father descended to the son, and De Witt Clinton, who pushed forward the act au-

thorizing the construction of the Erie Canal through the centre counties of the State, secured for it the support of the southern counties by promising in return his influence, and that of his party, for the construction of another highway through the region and along the line designated by his father. Fifty years passed away before the first step was taken toward the realization of this Appian Way. Meanwhile the methods of intercommunication had changed. The canal had supplanted the public road, and the railway was beginning to supplant the canal. And at last, in April, 1832, three years after George Stephenson ran his first passenger locomotive over the Liverpool and Manchester Railway, the Legislature of New York granted a charter for the construction of a road of iron where General James Clinton had dreamed only of one modeled as well as named after the famous highway of ancient Rome. This charter affords a curious illustration of the short-sightedness that is characteristic of the cunning of politicians. It forbade all connections with Pennsylvania and New Jersey railroads. For is it not the office of a Legislature to promote only the interests of its own State? So the one terminus was made at Piermont, the nearest accessible point in the State, on the Hudson River, to the city of New York; the other was made at Dunkirk, the most remote western harbor on Lake Erie. But through cars have long since been run direct both to Cincinnati and Chicago; and the long pier which was built out over the flats of the Tappan Zee, at Piermont, to make the steamboat connections with the city is only useful as a permanent warning to legislators that it is their business to facilitate the natural course of trade, not to obstruct, to divert, or to control it.

The railroad being conceived, and the conception having gained sufficient adherents to furnish a minimum of capital necessary to prove the dream of the originator to be not all a dream, the next step is a survey.

If the reader will turn to any map of New York State, he will find that the southern tier of counties, from the Hudson River as far west as Binghamton, are intersected by mountain ranges, whose abrupt and rugged character and wild and desolate features can be but very inadequately indicated. He will see also traced upon the map by insignificant-looking serpentine lines the course of two great rivers, the Delaware and the Susquehanna, whose branches are but sixteen miles apart at Deposit, while the waters of the one empty into Delaware Bay, and those of the other into Chesapeake Bay. These mountain lines indicate the difficulties to be overcome; these river lines indicate the methods by which the railroad engineer overcomes them.

The first work of the surveyor is to trace the general outlines of his course. These are almost uniformly indicated to him by the water-courses, for the water-courses indicate, first, natural openings between the hills; second, an easy grade in ascending from the lower to the higher levels. The Erie Railway enters the hill country at Suffern's. It follows the Ramapo River for a score or so of miles, strikes the Delaware at Port Jervis, follows the tortuous course of that magnificent mountain torrent to Deposit, crosses the mountains at that point, reaches the upper waters of the Susquehanna at the town of that name, leaves that river to follow the Tioga, a branch of the same stream, parts from that to avail itself of the valley of the Canisteo, crosses a short piece of intervening country to reach and follow down the Genesee, passes from that to the Alleghany, and does not finally abandon the river valleys until it is within forty-five miles of its original western terminus, Dunkirk. In its journey of 459 miles it has availed itself of the valleys of seven rivers. In a somewhat similar manner the Pennsylvania Central Railroad crosses the same great mountain range by aid of the Susquehanna, the Juniata, and the Conemaugh rivers; and the Pacific Railroad follows the Platte River almost to its source in the Rocky Mountains on the eastern side, and descends upon the western slope by the valleys of a succession of less important but equally useful mountain streams.

THE CONDUCTOR.

THE BRAKEMAN.

The first duty of the railroad surveyor, then, is to trace in a general way the course of the projected railroad upon an ordinary map by means of a careful study of its mountain ranges and its water-courses. The more detailed and elaborate the map, the more perfect can he make his preliminary and office survey. This being done, the real work of the survey begins. For this purpose the chief engineer makes a general reconnaissance of the whole ground, generally on horseback. He provides himself with the best map or maps he can obtain. He picks up as best he can more definite and precise local information. To succeed in his work he must have qualities which are rare, qualities which no mere school of engineering can impart. In his profession, as in every other, there is a certain something indefinable in native genius, something which may perish unused for want of development and training, but which no mere development and training can wholly supply. The engineer must be a man of ready parts. He must have himself always well in hand. He must understand human nature, and know how to deal with it. He must be equally at home in the log-hut among the mountains and in the velvet-carpeted and mahogany-furnished office in the great city. He must be a man of quick eye and abundant resources, able to meet an exigency, or to vary in detail and on the moment a carefully matured plan for the purpose of avoiding an unexpected obstacle, and reaching the gen-

THE SIGNAL-MAN.

eral result with the least expenditure of time and money. The engineer has tunneled the Alps, and an expert assures us that with money enough it would be possible to construct a permanent floating bridge across the Atlantic. But there are a great many things which it does not pay to accomplish, and the successful engineer must be able to subordinate professional pride to practical results; to avoid obstacles that can be avoided, and to overcome only those that he can not escape; to make the fewest possible rock cuttings, tunnels, culverts, and bridges; and to be known and honored less for what he has done than for what he has avoided doing.

The more accurate survey now follows. This is always effected in sections. It is performed by an engineer corps, which consists of an assistant engineer, a transit-man, a leveler, a rod-man, two chain-men, one or two flag-men, and a gang of axe-men. Where the company are obliged to camp out, the necessary accessories of a camp are added. The work of such a surveying party is always, under the best circumstances, one of hardship and adventure. They must stop at no obstacle; and the country presents innumerable difficulties which the map had not reported, and even the reconnaissance

WATERING-PLACE.

had not discovered. Morasses are to be traversed, streams are to be crossed, precipitous hills to be climbed, impenetrable thickets to be penetrated. The Erie Railway runs for miles along the banks of the Delaware River, in many places upon a shelf cut in the solid rock, fifty feet or more above the torrent. Yet somehow along this seemingly inaccessible gorge the surveying party had to make their way before the first blast could be fired to prepare for the present rocky road-bed. It is said that at some points they were lowered by ropes from the top of the cliff, and so, hanging between heaven and earth, took their levels. The earliest surveys of such works as the Pacific Railroad, through a country absolutely a wilderness, and almost absolutely an untrodden wilderness, are marvels of human capability.

The process of surveying does not differ widely from that with which we may assume our readers to be familiar in the laying out of town and farm boundaries and of public highways, except in one important particular. In the railroad survey the exact differences in level must be preserved and respected. Every inequality must be noted. This is done by the leveler, and is preserved by the profile map. Of these profile maps there are two—one, the larger map, indicates the general features of the route; the second and more detailed profile, or series of profiles, preserves to the foot a careful record of every inequality of ground over which the projected route is to pass. These reports indicate exactly the obstacles which the engineer has to encounter. They inevitably lead to new reconnaissances and new surveys. Deviations here and there are found to be expedient, to save expense, now in first cost of construction, now in subsequent cost of operating.

At length the facts are all before the engineer-in-chief, and he is prepared to make his report. It goes before the board of directors. Its conclusions are scanned, its methods cross-examined, its results subjected to the severest scrutiny. The counsel of other and often rival engineers is called in. A thousand questions must be raised, debated, determined, before any thing can be considered settled. The road must deviate here to get the custom of a large town or city, there to avoid grounds through which the right of way would be more costly than a tunnel or a filling; now to tap a rival or a cross railroad at the right spot, now to accommodate some wealthy and influential patron, whose interest in the road depends on making it at some point subservient to his own business. If the engineer could only be permitted to run his projected road where it would be easiest built, his problem would be a simple one; but he must also consider what will be the cost of carriage,

what will be expensive to maintain as well as to construct, where he will get custom, and how he may avoid local opposition. A single problem within our personal knowledge illustrates this phase of the work. A railroad is under survey along the west bank of the Hudson, which passes within a mile of our house. Five miles north it reaches the city of Newburgh. If it run along the river-bank, it must pay from half a million to a million of dollars for its right of way. That necessity it can avoid only by tunneling the hill on which the city is built. The city itself is evenly divided in opinion. One-half aver that a river railroad will spoil their commerce; the other half assert that a tunnel railroad will spoil their town. Whichever horn of the dilemma the company takes, it will be unpopular with half a city. And its engineer and directors must be wise not only to measure the comparative cost of the two plans (itself not an easy matter), but also wise to foresee the effect, on both through and local traffic, of both plans. In short, if the grown railroad is often whimsical and despotic, it does but avenge itself for the whims and despotism which it suffers from the public while it is yet in its infancy.

The railroad is projected; the projector has secured the co-operation of sufficient capital to enable a beginning to be made; it has been surveyed; the right of way has been obtained; a charter has been secured; it now remains to construct the road. In the inception of railroad life this was done by the company. Of the first railroad George Stephenson was both surveyor and contractor. He laid out every foot of the line of the Stockton and Darlington Railway, taking the sights through the spirit-level with his own hands and eyes. The plans of the Liverpool and Manchester Railroad he fought through Parliament by his own indomitable will in the face of the opposition of wealth and science and political power. And when at last the charter was obtained and the work begun, he personally supervised it from the beginning to the end, getting his breakfast of oatmeal with his own hands, living on horseback, personally inspecting the progress of every department of the work, supervising the pay-rolls of the men, and perfecting with his own hand the working drawings. But the growth of railroads has brought with it a division of labor, and now the railroad corporation rarely or never constructs its own line. This is done for the company by a railroad contractor. Fifty years ago the farmer literally built his own house, mortised the timber himself, perhaps cutting down the trees and squaring them with his own broad-axe, and calling in his neighbors to assist him with the raising. The gentleman of to-day hires a builder to construct his house and an architect to supervise it, and perhaps never sees his edifice from the day the

ground is first broken until he is ready to move in. Railroad architecture is a distinct art, and railroad building a distinct profession; and the company as little thinks of personally constructing its own road as does the merchant of personally supervising the erection of his own house.

The railroad contractor is eminently a practical man. He is apt to be a self-made man. He is not unfrequently one who commenced life with the spade, the pickaxe, and the wheelbarrow. He had greater industry or greater shrewdness than his fellows, and became the head of a gang of men. Then he took a small contract on his own account, invested luckily in real estate along the line of a projected railway, amassed a little capital, employed both capital and practical experience to good advantage, and so gradually got on in the world, till now, what with capital and credit, he stands ready to undertake any work which the railroad capitalist desires undertaken. He knows how many cubic feet of earth there are in a hill, and how many it will take to fill up a valley. He has a practiced eye for soils, and detects by a sort of intuition where the hard rock will be, and where the cutting will be an easy one. Earth digging, blasting rocks, pumping, embanking, boring and building tunnels, erecting bridges and culverts, are all familiar operations with him. He possesses a larger or smaller stock of wheelbarrows, picks, shovels, carts, earth wagons, and horses. He lays temporary sleepers and light rails as the work progresses, and generally owns at least one or two locomotives and the necessary dirt cars for dragging materials. He usually contracts for a section of the road to be built at a fixed price, or at one which varies within certain limits, according to the development of difficulties as the work progresses. He often sublets to other contractors his work in its detail. He sometimes makes a miscalculation and loses a fortune, but his miscalculations are oftener on the credit side of his ledger, and the result a fortune made. He has abundant opportunities to make incidental profits, and he is not slow to avail himself of them.

But he must not only have a practical knowledge of railroad works, he must have a practical skill in managing railroad workers.

The first public works of importance in England were the canals. The same class of workers that constructed them are now employed in the construction of railroads. Their popular name is derived from their original connection with the great system of inland navigation which preceded and prepared for railways; they are still termed *navvies*. The picture which Parliamentary reports give us of the character of these men is not encouraging to those who imagine

that violence and corruption are a peculiar characteristic of the American republic, and that the maintenance of a stronger and more centralized government, like that of Great Britain, would put an end to the brawls and lawlessness which they imagine to be peculiar to a free country.

"Possessed of all the daring recklessness of the smuggler," says one English authority, Mr. Roscoe, "their ferocious behavior can only be equalled by the brutality of their language. It may be truly said their hand is against every man's, and before they have been long located every man's hand is against theirs. From being long known to each other they generally act in concert, and put at defiance any local constabulary force; consequently crimes of the most atrocious character were common, and robbery, without any attempt at concealment, was an everyday occurrence."

Another English writer, Mr. Francis, is equally complimentary. "The dread which such men as these spread throughout a rural community was striking; nor was it without a cause. Depredations among the farms and fields of the vicinity were frequent. They injured every thing they approached. From their huts to that part of the railway at which they worked, over corn or grass, tearing down embankments, injuring young plantations, making gaps in hedges, on they went, in one direct line, without regard to damage done or property invaded. Game disappeared from the most sacred preserves; gamekeepers were defied; and country gentlemen who had imprisoned rustics by the dozen for violating the same law shrank in despair from the railway 'navigator.' They often committed the most outrageous acts in their drunken madness. Like dogs released from a week's confinement, they ran about, and did not know what to do with themselves. They defied the law, broke open prisons, released their comrades, and slew policemen. The Scotch fought with the Irish, and the Irish attacked the Scotch; while the rural peace-officers, utterly inadequate to suppress the tumult, stood calmly by and waited the result. When no work was required of them on the Sunday, the most beautiful spots in England were desecrated by their presence. Lounging in highways and by-ways, grouping together in lanes and valleys, insolent and insulting, they were dreaded by the good and welcomed by the bad. They left a sadness in the homes of many whose sons they had vitiated and whose daughters they had dishonored. Stones were thrown at passers-by; women were personally abused, and men were irritated. On the week-day, when their work was done, the streets were void of all save their lawless visitors, and of those who associated with them. They were regarded as savages; and when it is remem-

bered that large bodies of men, armed with pitchforks and scythes, went out to do battle with those on another line a few miles off, the feeling was justified by facts. Crimes of every description increased, but offenses against the person were most common. On one occasion hundreds of them were within five minutes' march of each other ere the military and the magistrates could get between them to repress their daring desires."

Christian philanthropy has not been oblivious of the condition of these navvies, equally dreadful to themselves and dangerous to society. Among the most interesting of all home mission work is that which has been carried on by ladies of the highest culture and refinement among these barbarians of civilization. The result of improved systems of administration by Christian contractors has been more effectual, however, than any direct and immediate efforts by lay missionaries. Of these the work of Sir Morton Peto may be mentioned as a type. He broke up the ticket system, i. e., the payment of wages by tickets, to be redeemed at the shop established by the contractor. He paid all wages weekly. He opened the way for house to house visitation by Christian clergymen and laymen. He provided cleanly barracks in lieu of their huts of turf or stone. He provided every one who could read with a Bible, and organized clubs for mutual help in case of sickness or misfortune. His example was followed by others; and though the English navy is not as yet a very creditable product of the civilization of the nineteenth century, his character and condition have greatly improved.

In this country the work of the pick and the barrow is largely performed by Irish laborers. Their temporary villages are familiar to every traveler on our railroads. Their management requires, on the part of the contractor, peculiar dexterity to avoid the loss inevitable from wasted hours or misapplied energies. In brief, the railroad contractor has under him an army of men without the discipline of an army; he must exercise over them the control of a general without being invested with a general's authority.

A condensed sketch of the difficulties and dangers attendant upon the construction of a single line of railroad will better illustrate the qualities which go to make a successful railroad contractor, and the nature of his work, than any general description. From Aspinwall to Panama there runs a line of railroad across the isthmus which bears the latter name. It is not a long line; its length is but forty-seven miles and a fraction. It is not of difficult grades; its highest point is but two hundred and sixty-three feet above tide-water, and its maximum grade is sixty feet to a mile. Yet this single, and in size comparatively insignificant, rail-

road involved the construction of one hundred and thirty-four minor water-ways and thirty-six bridges, the latter ranging from twelve to six hundred and twenty-five feet in length. The construction of this road occupied five years and nine months. It commenced at Aspinwall, in the heart of a swamp. The laborers had to clear their way through the tangled underbrush of a tropical forest, thigh-deep in water, subject at any moment to the attacks of alligators and other not less dangerous though less formidable reptiles, and enveloped in a cloud of flies and mosquitoes. Every workman went to his labor veiled. Residence on the land was impossible. An old brig anchored in the bay served the purpose of barracks. The constant motion of their prison-ship subjected the landsmen to continued nausea by night, which but illy fitted them for toil by day. The malarious fevers of the country converted their movable barracks into a hospital ship. The two engineers in charge took turns in the fever with their men, the least disabled rising from the hospital bed to give place to his companion. Natives were lazy, and would not work. Imported laborers from the North sickened and died in such numbers that the work actually stopped for want of hands. The importation of Chinese coolies proved an unsuccessful experiment, for melancholy and suicide thinned out their ranks almost as fast as malarious fever the ranks of their braver comrades. The house of the first engineer was built on the tops of stumps to keep it above the water-level. The freshets which swell the Chagres River, sometimes in a single night to a height of forty feet above its ordinary level, carried away the nearly completed bridge which was to span it. Twice the road was contracted for, and twice thrown back upon the company's hands, before it was completed so far as to enable a locomotive to pass over it from ocean to ocean.

A distinct department of railroad engineering is the bridge-building. This is now very generally undertaken, in the case of the larger bridges, by separate corporations. Iron and stone are very generally taking the place of wood as material for bridges on our best railways. The character of the structure, whether iron or stone, whether tubular, or suspension, or arched, depends upon the nature of the chasm and the stream to be crossed. Our artist, from the many illustrations of bridges which the Erie Railway affords, selects two (see pages 379 and 381) as samples of the problems to be solved by the railroad engineer, and the methods of solving them. In the case of the Starucca Viaduct the problem was, in descending the western slope of the mountain that intervenes between the Susquehanna and the Delaware valleys, to take a flying leap across a vale a quarter of a mile wide, from one hill-

side to another. The valley was quite too deep and long to be filled up with an earth embankment, which, moreover, would be in constant danger from rains and freshets. This problem was solved by the construction of a stone viaduct 1200 feet long, 110 feet high, and consisting of eighteen arches with spans of fifty feet. It is built of solid masonry, and appears to be as durable as the everlasting hills themselves. The other problem was involved in the necessity of crossing the Genesee River from the high table-lands through which, at Portage, it cuts a deep but narrow ravine. Its solution has given rise to one of the most marvelous wooden bridges in the country. It is built on thirteen stone piers set in the bed of the river, on which is reared a mass of timber rising to the height of 234 feet. It is said to be so constructed that any timber in the bridge can be removed and replaced at pleasure. These illustrations are taken but as types of the difficulties to be overcome by the railroad contractor, and the methods of overcoming them. The difficulties are as diverse as nature itself. To attempt any comprehensive account of bridges and bridge-building would require not a paragraph, but a distinct article.

In brief, then, it is the office of the railroad contractor not only to pierce the hills, bridge the streams, cross the valleys, construct the stations; not only must he be a bridge-builder, a road-maker, and a practical mechanic; not only must he do his work with ignorant, unskillful, often dishonest workmen, but he must do it frequently in the heart of a wild, waste wilderness; must transport thither his men, his tools, his provisions; must erect the shelter and provide the necessities of life for his workmen; must keep up their failing courage with his own, and must do all at the hazard not only of his purse, if his estimates have deceived him, but at the hazard of his health and even of his life.

The railroad is built. The money has been raised. The cars have been constructed, and the locomotives purchased. The railroad is equipped and in running order. Let us glance rapidly at the working of the road. For this purpose let us take the history of a single train—say, the morning lightning express on the Erie Railway from New York to Buffalo.

The first work of the day is to put the train together. Every traveler has observed what a wilderness of cars is scattered about the stations at the termini of our large roads. These labyrinths of railroad track are technically termed yards. At Hornellsville, where the two forks of the Erie Railway unite, one going to Buffalo, the other to Dunkirk, there are over sixteen miles of these side tracks. Through the heart of this yard the through track must be kept always clear for passing trains.

From the cars which fill up the sidings each outgoing train must be made up. In the case of the passenger express this is a comparatively simple matter. The cars that have come in the night before are re-arranged in a reverse order, are swept and dusted and washed, and ready for use again. But the putting together of a freight or mixed train is often a labor of great perplexity. The cars which are intended to form such a train are often scattered widely over the yard, one on the warehouse track, another on the lumber side track, a third on the coal side track, a fourth among the defective cars in the repair shop. These it is the business of the yardsman to collect and organize into a train. For this purpose there is placed under his orders a small switching engine, with its engineer and fireman. From morning to night this yardsman is on the move. He must know every inch of his dépôt yard, the beginning and end of every side track, the peculiarities of every switch, the time of the arrival and departure of every train, the location of every car. He must know how to get them in place with the least possible waste of time and energy, how to utilize every moment, when he may safely cross this track, when run along that. All day he is dodging in and out among tracks crowded with cars, and often with passing trains, with nothing to guide him but his own judgment, making his own time-table from minute to minute, sometimes under exigencies such that a delay of a minute results in a delay of hours. Next to the engineer and fireman, there is perhaps no position of greater hazard or greater responsibility than that of the yardsman.

The train is in its place. The early passengers are arriving and getting themselves comfortably seated for their trip, while the fireman is at work preparing his engine for the day's work. Every engine has its own engineer and fireman. This is a necessity, for an engine is like an organ; each new one must be learned anew before one can play on it well. The most experienced engineer can never use a new engine to good advantage. Did you never examine the iron horse as it stands at the head of its train, impatient to begin its day's journey? How it shines! What mirrors every bit of burnished brass and polished steel! It must be groomed like a horse, and the fireman is the groom. There is a hostler besides, or gang of hostlers: wipers they call them. When the engine comes in from its day's duty it goes straight to the engine-house, and the wiper takes it in hand. Sooty, dusty, smoky, greasy, and hot, it is delivered to him. He does not leave it until every piece of metal shines again like French glass, or the reflecting mirror of a great telescope. "Mighty unpleasant sort of work it is until you get used to it. For you see an engine don't cool

down right off when it comes in, and it's pretty hot work handlin' machinery just after a hundred-mile run, and the steam only just let out of the boiler." Yet, with all the hostler's care, the groom is never satisfied; and after the morning fire is kindled, and the tender is piled full of coal, and the water has been taken on, you may see him still polishing away at portions of the machinery, which might well be the envy of any housekeeper. All aboard! The last look is taken by the careful engineer at his machinery, the steam is tested, the signal-bell rings, and the train starts and rolls slowly out of the station.

Come ride with me on the engine. It will be necessary to get a special permit from the superintendent, for the strictest orders forbid the engineer to carry any one on his engine without— Nay, stop! It is nothing much to ride on an engine by day; but with Mr. Joseph Taylor, himself a railway superintendent, for our companion, we will try it on a night express.*

"The Greyhound had a full head of steam on, and was blowing off its safety-valve, making a deafening noise, and groaning with the power within her. Carefully proceeding through the yard and fast freight trains that would follow us, we soon left the station lights behind, and plowed into the darkness and the storm.

"John Dobbs was one of the oldest and best men on the road. It was his boast, and an honest one, that during the sixteen years he had been driving on that road, he had not cost the company a dollar for any negligence or mistake of his. His record was clear. I sat and watched him from the opposite side of the cab. He was rather tall, thin, and of a nervous temperament; and although not even the smoke-stack of the engine could be seen for the darkness and the drifting snow, his piercing eye never wavered from its unsubstantial mark. One hand on the throttle, the other on the reversing lever, he stood erect and firm, intensely propelling his vision into the abysmal darkness beyond. The Greyhound began to feel her feet; her speed increased with every stroke of the piston head. Her machinery quivered with its force; she leaped and reeled on each defective joint, but her iron members held her firm. The fireman never ceased to cast in the fuel, and the fierce flames darted ardently through her brassy veins. Suddenly a scream from the whistle, a quick movement on the throttle—the fireman rushed to the other side of the engine—a flash of light! We passed a station and a freight train on

the side track. More fuel into the fire, and the Greyhound urged ahead, for now we had a straight piece of track before us. The storm abated, and the sky cleared. The fireman produced from his pocket a small cutty-pipe, loaded it with tobacco, lighted it with a puff or two, and without saying a word, stuck it between John's teeth. John had taken about twenty rapid whiffs, when the fireman, as unceremoniously as before, transferred it to himself, and with a few fierce draws consumed the load—a very impolite proceeding, but apparently part of the discipline of the engine. Those few draws did both men good. Johnny's grasp tightened on the throttle, and the fireman with new energy threw in the wood.

"We passed a few more stations and freight trains, and at tremendous speed bounded from the level down a grade, the steepest on the road. Steam was shut off, the fireman seized the wheel, the whistle screamed for the brakes, and we finally came to a stand right under the hose of a water-tank.

"'Engine-driving is trying work such weather as to-night, Sir,' said Johnny, wiping the perspiration off his face with his sleeve, 'when you can't see your signal-lights, nor even your smoke-stack, and you have to run like mad on a bad track to make up time so as not to lose connection. I tell you it makes a man sweat if he's as cold as a lump of ice. You have to go it blind. You can't see if the switches are right. If trains you are to pass have got into a side track, you can't make out any thing till you're right into it. It's trying work on the mind, Sir, is driving an engine. Such as us get very little sleep. The other night my wife started up in bed and screamed as if she was being murdered. "What are you doing?" she cried; and bless your life, Sir, there was I pulling her slender arm with all my might, while my foot was steadied against something else, trying to reverse.'

"Over this dream at his wife's expense John Dobbs laughed heartily; and as the tank was now filled with water, and a fresh supply of wood was thrown on the tender, I wished him good-night, preferring to complete my journey in the palace car at the rear."

With John's statement, "engine-driving is trying work on the mind," we fully agree; in truth, no one who has not ridden on the engine of a fast express by night, as we have done, can imagine how trying it is. No wonder that the perpetual stimulant to their nerves indurates their sensibilities; no wonder that, as a class, railroad engineers are a "hard set." But they are, with rare exceptions, noble, faithful, true, ready always to sacrifice themselves to save their train. The true engineer must be a man of ready resources and quick instincts. He must have a mind that is stimulated, not dazed, by emer-

* We quote from *A Fast Life on the Modern Highway*, from a semi-serious point of view, by Joseph Taylor (Harper and Brothers), to whose graphic pictures of railroad life we are largely indebted for our account of the practical working of the American railway.

gencies. He must know how to think quick in the threatening of danger; when to shut off steam and stop his train; when to put on more steam, and run the hazard of brushing the obstacle from the track with such momentum as to save himself and his passengers. He must know both his engine and his road, what she can bear, and what strain the road puts upon her; where are the up grades where she needs all her steam, where the down grades where all should be cut off; where the crossings where the whistle or the bell must be sounded, where the stations, and how to adjust his speed so as to stop just at the right time and place. He must have ears and eyes and thoughts all and always alert. He must not merely, like Davy Crockett, be sure he is right and then go ahead, but be sure while he is going ahead. He must look out not only for himself, but for others as well, and never can be certain that the switchmen, on whose fidelity his life and the lives of all his passengers depend, have done their duty until he has safely passed the crossing or the siding. In short, it is not only true of him that there is always but a step between him and death, but it is always also a step of one who is traveling thirty miles an hour. He must be a practical mechanic, and be able to repair a break in his engine without adequate tools. He must be a man of iron will, able to withstand every influence and pressure in times of difficulty. An express train on a single-track railroad comes to a station. It is here to pass a down express on the same road. It is winter. Both trains are behind time. The time-table gives the right of way to the up train, but requires "caution." The word is a vague one, and capable of various constructions. The engineer resolves to wait where he is. The uneasy passengers wish him to go on. Delegation after delegation urge him to do so. At length a telegram is received. It reads simply, "Come ahead." It is neither signed nor dated. The obstinate engineer will not budge. The passengers hold an indignation meeting. Resolutions are reported and carried, to be presented to the president of the road. And just as the meeting is adjourning down comes an extra engine, carrying no light, and running at sixty miles an hour, to get doctors to attend the wounded on a "smash up" of the down express eleven miles above.* The obstinacy of the engineer in giving a rigid construction to the one word "caution" has saved the company another smash up, and the doctors more patients. The thoughtful traveler will probably recollect more than one instance in which the unreasonable public has similarly berated a delaying train, and yet would have been equally quick to

denounce the careless engineer if he had yielded to its own unreasonable demands.

Scarcely less important in the management of the train than the engineer is the conductor. He is the captain of all but the engine. He must be a good judge of human nature, know how to be quick and yet courteous, firm and yet affable. He must be able to detect the difference between the real unfortunate who has lost his ticket and his purse together, and the railroad swindler who makes a pretense of loss serve him the purpose of getting many a free ride. He must be equally competent to help out with all her bundles the anxious lady from Pumpkinville, who has never ridden in the cars before, and quick to eject the brazen-faced defrauder who has no ticket, and no notion of paying for one. He must be brave, for his courage is often tested; forbearing, for his patience is sorely tried; and faithful, because great trust is reposed in him. He must have some practical knowledge to help him with expedients when accidents occur, a ready judgment and nerve to act promptly in time of danger. He must see that no time is lost at stations, carrying his timetable in his head, and never misrecollecting its figures; have at his fingers' ends all the intricate system of rules and regulations issued by his superiors; keep on good terms with his engineer and his brakemen, and control the latter without seeming to do so. He must have an eye to the condition of the track, the trestles, bridges, culverts, and embankments; must keep in mind and under examination the brakes, couplings, and bell-ropes of his cars; must inspect his train before starting, to see that his cars have been carefully swept and dusted; must know that his watch accords with railroad time; must be sure before starting that he is properly provided with flags, signal-lamps, torpedoes, links, and pins. He must keep on the alert for signals from the engineer, and from stations on his route. He must keep in mind his passengers, see that they get out at their right stations, or take their maledictions in recompense for their own ignorance or inattention. He must take up all tickets, and often must go through a long train twenty or thirty times on each trip to make sure of the tickets of his way-passengers. He must get out at every station, see his passengers all off, and signal the train to proceed, being always in time and never in haste. He must have plenty of leisure to answer all the questions and respond to all the complaints which curious or captious passengers have to prefer; and he must keep a perfect account and render a perfect report of all tickets and fares collected. In brief, the combined duties of captain, clerk, and steward of a steam-ship fall upon the conductor of a first-class passenger express. He travels usually from one hundred and fifty to two

* A fact. See *Reminiscences in the Life of Locomotive Engineers*, 1861, page 115.

hundred miles a day, often including the Sabbath, and his compensation reaches the enormous sum of \$1200 per year!

Since the invention of the Westinghouse air brake the office of the brakeman has sensibly decreased in importance. This brake is operated by compressed air, which is driven through tubes beneath the cars by the steam from the engine. These tubes are coupled when the train is made up. The whole is operated as one brake from the engine by the fireman. It places the whole train completely under the engineer's control. The through fast express trains on our great trunk roads are now, we believe, generally supplied with this contrivance. But the train can not spare the brakeman. He stuffs fuel into the stove at the request of the passenger who is too cold, and opens the window at the request of the passenger who is too hot. He unlocks the seat and turns it over for the mother who wants to convert it into a lounge for her tired child to sleep on. He opens the door and shouts in stentorian tones some unintelligible words at the approach to every station. He occasionally makes announcements, but as he usually does this when the train is in full motion, and as he has never been taught to articulate very distinctly, the passenger who is curious to know the meaning of his address has always to ask for its private repetition. He is always on hand to help passengers off the platform. Of men he is decidedly oblivious; he is a ladies' man, and the assiduity of his attentions is generally in the direct ratio of their youth and beauty. When he can inveigle a young lady on to the platform before the train has quite reached a stop, and can protect her from falling by gently encircling her waist with his strong arm, he is perfectly happy. A virtuous brakeman is never without his reward.

The freight brakeman has duties more arduous and dangerous. Mr. Taylor says that there are reputed to be five hundred distinct car couplings for which patents have been obtained, or at least sought. But as yet the coupling of freight cars is done by hand, and this duty devolves upon the brakeman. Balancing the pin over the end of the bar through which it is to be dropped to perfect the coupling, he awaits with composure the coming together of the cars. Leaning over the track, he supports the link or bar in one hand, and holds the pin in the other. When the cars come together with force, and continue on their way for some yards, the brakeman who is performing the coupling is for a moment lost to sight. It may be that he will directly step out, vigorously crying, "All right—go ahead!" It may be that he will have fallen beneath the wheels, one more victim to the present rude and cruel method of freight car coupling. We repeat here and emphasize

the demand of Mr. Taylor for reform in this matter. "It is high time that some steps were taken to lessen the number of shocking casualties from car couplings which are recorded with such monotonous frequency in the daily newspapers. If the railroads will take no concerted action in the matter, it will be the duty of the State Legislatures to compel railroad corporations to make use of better and safer methods of coupling cars than many of them now do. This would, of course, be attended with some inconvenience, but it would save the lives of hundreds of railroad employes." We may add that the radical cause, probably, of this neglect is the fact that the lives of railroad employes are inexpensive. The railroad corporation is held responsible for all accidents, occasioned by its negligence, to its passengers, but a rule of law, which certainly in this instance works with apparent injustice, renders them exempt from damages in the case of injuries to employes. So long as brakes cost more than brakemen we may expect the present sacrificial method of car coupling to be continued.

These are the officials on the train—the conductor, engineer, fireman, and brakeman; for the express agent and water-boy and newspaper vendor can hardly be entitled as train officials; and the baggage-master, though an important personage, as the bride discovers when at the end of her journey her trunk is not forth-coming, has really nothing to do with the conduct or management of the train. But not more on a conductor or engineer does the safety of a train depend than on the switch-tender. Of these there are on the Erie Railway three hundred and fifty. If on any of our railroads one of these switch-tenders fails of his duty, sleeps at his post, mistakes his instructions, forgets or misplaces a switch, blunders through heedlessness, or blunders through what is quite as common a cause of accident, excessive care and anxiety, the result may be a terrible accident—a train off the track, a collision, or a precipitation into an open draw. Literally the movement of a rail an inch one way or the other is all that saves every express train from destruction, and this not merely at one point on the line, but at every station and side track. And these switches are generally presided over by Irishmen, whose average wages are a dollar and three-quarters per day. No wonder that misplaced switches are the most prolific of all causes of accidents.

Take your stand for an hour in the yard of one of our great railway stations; watch the switchman on duty; observe the rapidity of his movements, and their constancy. As the trains and engines pass, sometimes crowding in close proximity upon each other, see him guide each one by his lever to its appropriate place: sending this train down

a side track, opening the way for that train to pass up upon another siding, now letting a single engine run down the track for a freight car, now switching off a long freight train to a remote quarter of the great yard, and all the time keeping in mind the through passenger trains which come thundering by in either direction, and which depend on his memory and movements for a clear track. Mr. Taylor pictures his perplexity in this sketch of the switch-tender's soliloquy:

"Let's see. Excursion train's due at 4.45, and it ain't in. There's the accommodation whistling like mad, though before that there was the mixed. No! that must have been the Blue Line freight. No! that was a stock train. No, it warn't, neither; that was the empties. This is the oil train; I can smell it; and right in the way of the express; and darn me if I know which track she's on."

It has been said that quite as common a cause of accident as carelessness is excessive care. We believe that railroad men will bear out this assertion. For generally the responsibility put upon the switch-tender is too great for his capacity. He can not bear it, feels that he can not bear it, is oppressed by the sense of its weight. So long as every thing goes smoothly and regularly, he performs his part in the great machine. But any sudden exigency throws his mind into a whirl; he can no longer think; he knows that the lives of a hundred passengers depend on his actions; there is but one instant to decide and to act; and he does the very thing which produces the disaster against which he meant to guard.

"I was standing," says a railroad superintendent, "near a switch-tender who had been twenty years in our employ. He was steady as the day is long, was religious, conscientious, and a total abstainer. He did not know that I was near. He turned his switch for the freight train to pass upon the side track, then turned it back for an approaching express. When the whistle sounded, announcing the approach of the train, he went deliberately to his switch, and turned it back, so that the lightning express must have inevitably dashed right into the waiting freight train. I yelled with all my might, 'Reverse your switch!' He sprang to the handle, and reversed it; he had not a second to spare; the train flew by with the velocity of light, and was out of sight and hearing in a moment. The man could give subsequently no account of his conduct. When the whistle sounded an impulse seized him to turn the switch, and he did so instantly, under an impression that the switch was wrong."

How many times, reader, have you gone to bed and forgotten to wind up your watch, and never discovered your neglect until you found it run down the next morning? How

many times have you wound it up so mechanically and unconsciously that five minutes later you have taken it out of your pocket to repeat the operation? What we do habitually and mechanically we are apt to do without thought, and also to forget to do. When the switch-tender repeats with his switch your blunder with your watch, the result is often a terrible railroad accident. When I consider what an army of switch-tenders is employed on the 65,000 miles of American railway,* I wonder that the misplaced switches and the consequent railway disasters are not more common.

Scarcely more important, although a vastly more dignified and better paid official, is the train-dispatcher—more important in that engineers and switchmen and conductors are subject to his orders. On certain roads his duties are united with those of the division superintendent. He is to the road what the officer of the deck is to the ship. On a double-track road trains can to a large extent be run by a time-table and general directions, but on a single-track road every delay calls at once for orders from headquarters. It is on the single-track road that the train-dispatcher's functions are at once the most important and the most perplexing.

Each dispatcher's section is from fifty to one hundred miles in length, according to the number of trains running, difficulty of working, etc. Where continual day and night work is required there are three dispatchers to each section, who work each eight hours. The department is administered by telegraph. So long as every thing is on time, and there are no extras, specials, or "wild-cats," the train-dispatcher has nothing to do. But the first delay or difficulty is the beginning of a tangle which he must unravel. Snows, storms, fogs, accidents, delays on other roads, may sometimes all combine to make confusion worse confounded. Catamount has jumped the track, and is in the way of the down express; Zebra is stalled on the grade outside the yard with a heavy freight train; Hippopotamus is out of water; Snorter has blown off a steam-chest cover; Fly has burst a flue; the Lightning is twenty minutes behind time, and Whirlwind is waiting for her at C station. The train-dispatcher must have before him a perfect mental map of the road in this abnormal condition. He telegraphs the Lightning to go on to D, and wait for Whirlwind there; he telegraphs to Whirlwind to push on to D, and pass Lightning there; he telegraphs to station agent at D both the orders; he sends an extra engine out to give Zebra a push up the heavy grade; he summons a force from the repair shop to go to the assistance of Snorter; and

* The exact figures, according to *The American Railroad Manual*, are 66,491.

he issues cautions all around of the accident to Catamount. In all these cross and complicated arrangements he must keep in mind the siding accommodations at various points, so as not to get more trains together than he can get out again without delay; make allowance for the weight of trains and the power of their respective engines; remember the state of the rails, whether slippery or not; not forget the grades and all local peculiarities; keep himself informed moment by moment of the status of the road, for the trains are always in motion, and changing their relative position all the time; study to save the time of the passengers at the loss of freight time, and the time of stock trains at the loss of dead freight. He keeps a record of every movement, and at the end of his watch passes along both the complications he has cured and those he has created to his successor, to be dealt with in similar fashion. In the train-dispatcher's office the motto of the republic, slightly altered, might be appropriately framed and hung—Eternal vigilance is the price of safety.

Of the other subordinate officials who contribute to the care and comfort of the passenger, the station-master, the ticket agent, the baggage-master, the sleeping car conductor, the porters, we shall not attempt to speak. Yet we should do a manifest injustice to our theme did we not at least remind our reader of two features of the American railway system—through tickets and through checks.

By an admirably adapted system the American traveler may now purchase a ticket at any of our great stations for almost any other station, and by almost any combination of routes he chooses. The tickets are handed to him in a long line of separate yet connected bits of card-board, good for a ride over a portion of his chosen route. On most through lines his ticket is good until he uses it. It is good for him or any one to whom he chooses to sell it. He may go half-way on his journey, stop, make a visit of six months, and then complete his trip. Each ticket bears on its face a mark indicating by what railroad it was sold, who therefore has received the money. At certain stated times these tickets are carried by the roads that have taken them up to the roads that have sold them, and are turned in as so much cash. A balance is struck, and the road that is debtor pays its balance. In England there is a regular clearing-house established for the transfer and settlement of these complicated accounts. The freight accounts are yet more complicated. Freight is carried without breaking bulk from New York to Chicago or St. Louis. It goes in a car of one company, and is drawn over the road of three or four others. One company receives the full amount of freight from the

merchant. It must divide, according to a settled system, the sum between all the companies engaged in the carrying process. The system of railroad accounts is as intricate and involved as that of the largest banks. Indeed, it is doubtful whether any other financial concern in the country, except perhaps the United States Treasury Department, has the handling of so much money, or so perplexing and difficult a system of account book-keeping to maintain. The auditing department of the Erie Railway occupies the whole upper story of its immense building on the corner of Twenty-third Street and Eighth Avenue.

The through checks are equally convenient. When the traveler has once a little piece of brass in his pocket, he may dismiss his luggage from his mind. For this piece of brass is the company's receipt for his trunk, and the corporation is thenceforth responsible for its safe carriage and its ultimate return at the end of the journey. The trunk passes over half a dozen different lines. It is registered in as many different books by *dépôt* and baggage masters. The story of its journey is written all along the road. And if by any rare mischance it miscarries, the probabilities are always in favor of speedily finding it again. We say rare mischance; for the system of checking baggage has reached such perfection in America that it is our strong conviction that miscarriage of checked trunks is rarer than the miscarriage of letters by the Post-Office Department. There is no such system of checking baggage on the European roads. The traveler, like the elephant, must take care of his own trunk. But life has its compensations. In Europe ladies travel with valises. Saratoga trunks are unknown.

As I have omitted all attempt to describe in detail the duties of certain of the subordinate officials, so I make no attempt to portray the life of the chiefs of a great railroad. There is ordinarily a general ticket or passenger agent, to whom all local ticket agents are responsible, before whom come, in the first instance, all complaints of passengers, all grumbling of commuters, all applications from local communities for changes in trains, and all applications for passes—and they are legion. There is a general freight agent, to whom is referred the general direction of all matters connected directly with the freighting business of the road. There is a general superintendent or vice-president, for sometimes the latter fulfills the duties of the former officer, who is the chief executive officer, so far as the working of the road is concerned, who holds in his hands all the threads which in this article we have attempted to trace. He must know how conductors and engineers and train-dispatchers and station agents and baggage-masters all fulfill their duties; he must investigate

every accident and determine its true cause; he must be able to administer without fear and without favor, and be equally ready to save an honest official from the indignation of an unreasonable public, or to sacrifice a favorite and friend when just cause of complaint is shown against him; through the reports of others and his own not infrequent inspection, he must keep himself acquainted with the condition of the road—its rails, its trestles, its bridges, its culverts, its stations, its cars, its engines—and not wait until some dreadful calamity discloses a rottenness which his lynx eyes ought to have discovered. Finally, there is the president, who must above all things know the stock market and the secret railroad combinations, must be ready to combine with rivals or defy them, to compromise with Legislatures or to fight them, to meet the bulls to-day and the bears to-morrow on the street, and with all this to be the true captain of a ship which stretches across a State, from the Atlantic to the lakes, with a crew large enough to equip a navy; the housekeeper of a living and throbbing house, with fifteen thousand servants, not more than a score of whom he knows by name, and not more than a hundred of whom he has ever seen. Railroad kings we call them, and not inaptly; for the executive genius of a Cæsar, a Charlemagne, a Peter the Great, or a Frederick would find abundant opportunity for its fullest exercise in maintaining, operating, and extending a great American railway.

THE KEY OF THE FAMILY CLOCK.

I.—IN WHICH THE MACHINERY IS REGULATED.

MR. MABY'S family consisted of eight children, father, mother, and two servants. These formed the hours on the dial of the household, and Janet was the key. Did not the baby suggest the wee sma' hour in more senses than one?

When it is taken into consideration that Mr. Maby's gaze was distraught from long and fruitless search after the golden nugget of fortune, and that Mrs. Maby had long since straggled out of the rear-guard in the ranks of fashion, it is small wonder that Miss Evelina Maby, descending at the door of No. 5 Cottage Place, had something the aspect of a fairy godmother. Miss Evelina was tiny, alert, shriveled, with parchment skin and a hooked nose. Moreover, she had peculiarities of disposition, which are supposed to be excusable, as she also had money.

Fate brought the rich relation to No. 5 Cottage Place on a rebound of temper. She had quarreled bitterly with certain other Mabys; had, indeed, discovered fraud and conspiracy plotting, and to punish the of-

fenders she recalled these indigent, inoffensive Humphrey Mabys, previously forgotten for years. So Miss Evelina descended from a carriage at No. 5 in the sultry July noon-day, bringing her household gods with her.

"She looks like Lady Kew," observed Janet, peeping through the blind, and restraining her youngest brother from falling out of the window.

As Janet was the key of the family clock, her words were law, and Miss Evelina became Lady Kew to the indigent Mabys ever after.

On the fifteenth day of the month, precisely one week from the date of her arrival, Lady Kew emerged from No. 5, holding Janet firmly by the wrist, and followed by her maid, a Skye terrier of uncertain temper, and an army of Russian leather bags. She seemed to regard Janet as a prisoner—nay, more, she kept a vigilant eye on a modest portmanteau, as if she feared it might vanish in some pantomime trick.

A wail went up from the little Mabys on the door-step as the carriage drove away, mother sighed, pretty Alice sobbed petulantly as she withdrew to the parlor sofa and the perusal of a watering-place story. Oh, to float about on cool balconies in diaphanous drapery to the admiration of mankind, and the envy of other girls!

"I wish you had taken Alice. She would have enjoyed it so much!" said Janet in the train, her own eyes sparkling against her will.

"I detest big girls," responded Lady Kew. "It is time you went away. Absolute despotism is injurious to any one; it has ruined me. Mind you, I anticipate that you will be an old maid; I see no way for you to clear your skirts of all those clinging little fingers, but I intend giving you one chance. I do not expect to influence you. Bless you, no! I might as well talk to the wind, only by-and-by the nestlings will fly away. What will you be, as wives and children interpose? A good old sister?"

Janet was not listening. A wrinkle grew in her fair brow.

"Oh!" suddenly exclaimed this young housekeeper, "I have locked the pantry, and they can get no cake!"

"Let them go without, then," remarked Lady Kew, throwing a silk handkerchief over her face, preparatory to taking a nap.

A fairy godmother is a very good person in real life; the verjuice of Lady Kew's purpose was converted to the rich wine of blessing for the queen bee of the Maby hive. A holiday had never before fallen to the lot of Janet—a period of leisure, of novel sights, of fresh muslin gowns, filling the youthful feminine soul with content.

There was a break of gold in the dull sky; the train was speeding on toward the darkness of a horizon where the summer day

seemed to fold its petals in twilight like a flower.

Lady Kew slept, with a suspicion of a snore, beneath the silk handkerchief. Janet wondered, with that premature brow furrow, how they were getting on at home. She had indeed adjusted the mechanism, yet how soon would her authority be set at naught, the little domestic tyrant pondered. It was like the Shah's quitting his dominions for this eldest daughter to leave No. 5 Cottage Place—her world. How divine what might happen in her absence? Would her anxiety have been lessened, think you, had she known that Addy, the maid, had already fallen down the back stairs with a tray of china, bouncing from step to step with alarming violence, and in her frantic efforts to save the best tea-pot, had arrived at the bottom in a generally dislocated condition? Would her appetite have been improved for the delicacies of her destination by a knowledge that cook had scorched the soup, giving the lucid explanation that "Miss Janet had always seasoned it?" Would she have rested in her bed with a clear conscience that night had she beheld "in her mind's eye" papa wandering drearly over the house in search of a clean shirt, when he had been told a dozen times that all he possessed of that article in the world reposed in the lower bureau drawer? Alice in the parlor, with her elbows on the window-sill, and her head thrust forth into the sultry street, was moodily resolving to go on the stage and mend her fortunes. Mother was sitting in a draught, unmindful of neuralgic twinges. The little Maby girls were solemnly converting the residence of their dolls into a summer hotel, while baby gnawed the nose of the best wax lady. Thomas, the cat, roamed among the milk-pans with a demoralized appearance; and such silver as the Maby establishment boasted lay scattered within reach of the first burglar.

Janet touched with coy finger that rosy-hued curtain, all embroidered and spangled with fancy's richest silver and gold, that veils the future of youth. A fair, serious face, with honest, sunny eyes, and framed in rippling chestnut hair, which caught the light in many a wave and tendril; a small form, with a self-reliant pose, a prim neatness of attire, and two little feet that trod the earth firmly. Such was the key of the family clock. Thought flashed shuttle threads through her brain, but did not gift her with clairvoyant powers, fortunately. Still the train sped on, with old age sleeping, and youth alert for fresh scenes.

II.—IN WHICH THE PENDULUM STOPS.

"Miss Maby has arrived. Dear creature! How I long to see her," said Horace Dale, pulling his yachting hat over his eyes.

"She will furnish us with sauce piquant,

certainly," laughed his brother, kindling his cigar, with the aid of Ilma Lamar, who deftly unfurled her fan to shelter the flickering spark from the wind.

"Thank you, Miss Ilma. You are always kindly attentive to the need of others."

Ilma raised herself on tiptoe, her garments fluttering in the breeze, and broke the lance of her brilliant glances against the mail of this prosaic gentleman's breast.

"Wait until you see Miss Maby's niece before you praise old friends," she said, smiling archly.

"Nonsense!" he returned, impatiently. "What are girls to me?" and took his book to the extreme point of shore for the day, in sheer disgust at the artful suggestion.

Miss Ilma looked after him, her white teeth set. "Sufficiently boorish, monsieur. You are not worth my lightest thought, and yet I am determined to win."

This girl was the offspring of a Polish mother and an American father. The very contradictions of these elements frequently ran away with her own cooler judgment. She was clever, quick, not devoid of tact, with the keen hunger for wealth known only to poverty. While speaking to Mr. Dale she had been handsome; mobile, irregular features lighting up brilliantly; now she was actually plain. She recovered herself at once, and turned to Horace Dale, who lay indolently on the sand.

"We must take our sail before the tide turns."

"Must we?" yawning slightly, and consulting a chronometer. "I suppose it will serve to kill time."

"Merci;" sweeping him a mocking courtesy.

"Oh, come, we have known each other too long for ceremony. Is the new girl good style?"

"No style at all; and engaged to a young clergyman. I will be ready in ten minutes."

Tripping toward the hotel, the young lady paused to accost a chubby urchin, who must be considered as the actual hero of our tale. His hat was tilted back, and beneath the brim appeared a full-moon face much flushed by the exertions requisite to build a fort, with the aid of wheelbarrow and spade.

"Freddy darling, would you like to go out on the water with me?"

Freddy darling's response was delivered with all the frankness of innocent childhood.

"No."

Snub number three failed to crush her elastic spirits. Ilma's world was one of snubs, but she also had her revenge. Drawing on her neat gloves, she peeped into a parlor where sat a bevy of maidens at work.

"Where are you going?" chimed curiosity, in chorus.

"Horace Dale wishes a sail. How charm-

ingly cool you look in here! The obstinate fellow holds me to this engagement."

Then she ran away, laughing. A tête-à-tête on the water with Horace Dale instead of yawning over worsted-work, and gossip in the parlor!

"One must blow one's own trumpet sometimes," reflected this child of her century. She was satisfied with her morning's work. She had sent Mr. Dale to the point, and taken Horace out on the water, with the distinct intention of not returning until evening. She never underrated a new girl, for she had become an old story, than which there is no more fatal position. She intended to marry Mr. Dale; failing him, the less eligible Horace; failing both, to thwart their fancy for others. Thus deciding, the female Machiavel steered for the light-house.

Strolled the new arrivals on the beach, Janet holding a linen umbrella over the head of her ancient relative.

"Take care, or you'll step right on the fort," piped a shrill young voice.

"What is this?" exclaimed Lady Kew, putting up her glass.

Janet knelt to restore the crushed boundary. What more natural than that a freemasonry should be established between the little housewife and the juvenile architect, who watched her labors with a certain condescension?

"Who are you?" demanded Lady Kew, sharply.

"I am a widower's child," was the somewhat startling reply.

"Who taught you that?"

"Nurse did."

"Ho, ho!" croaked Lady Kew. "Come along, my dear, or we shall be accused of setting our caps for the father."

Lady Kew was in her element at Clamshell Point, a fashionable resort, where costly fabrics grew limp on the rocks; where the sand burned in yellow waves beneath the feet, and filtered into nose and ears, while mosquitoes buzzed playfully about the ankles of pedestrians. The dreary little cynic sat behind the parlor curtains, and passed the hotel in scathing review. Who knew better than herself the mildew taint on the fairest fruit? Who doubted the apparent purity of human gems? Janet's chaperon, of course; and yet her mirthless philosophy failed to influence the girl's sound nature, or enchain the buoyancy of her spirit.

Janet stood shyly behind Lady Kew's chair.

"Is that the new girl?"

A subtle consciousness that she was the object of scrutiny sent the blood mantling to her cheek. A pang of doubt as to the style of her raiment oppressed her amidst the bewildering variety of Clamshell Point. If Alice were only in her place! Before she was prepared for the emergency a tall young

man, with lazy blue eyes, and a handsome mouth just veiled beneath a silky mustache, was greeting Lady Kew effusively, and inviting Janet to stroll on the piazza. Janet's feet became lead, her tongue ice, her elbows prominent. Innumerable eyes stared at her, but most uncomfortable of all, the mocking glance of Ilma Lamar.

Said Lady Kew, "Mrs. Marble is really well done. She was enameled in Paris last year, you know. And there is Ilma Lamar! Hasn't she got married yet?"

The person addressed was Mrs. Dale, a mild, care-worn lady, with a general tendency to jet in her attire, whose life was made anxious by the possession of two eligible sons.

Out in the starlight Janet found leisure to be ashamed of her recent awkwardness. Horace Dale was her first cavalier. Good-humored jests, high spirits, propinquity, with the feminine drapery flowing over the masculine boot, and the button-hole flower a star in the perfumed twilight, create sympathy, and lead—to something more.

A white form drifted past them, and paused in the light which streamed from the door.

"Mr. Dale, please forgive me if my silly words annoyed you this morning"—softly modulated tones, and a delicate upturned face imploring pardon with a passionate appeal.

Simple Janet stared; her companion muttered, "What an incorrigible flirt!" in remembrance of some tender scene at the light-house possibly. It was thus that Ilma always overreached herself by a coquetry and dissimulation inherent to her Polish blood. Horace drew Janet forward.

"Geoffrey, Miss Maby." Two shadows bowed stiffly.

"A jolly little girl, engaged to a clergyman," was the verdict rendered by the younger brother to the elder an hour later.

The first golden arrow shot by the sun over the sea touched Janet's eyelids softly, bidding her arise. To step out on the lawn, devoted later to croquet, was a delight; to ramble on the beach, and have the wide expanse of wet shimmering sands all to herself, was ecstasy. Stay—alone? A small boy was trudging soberly along, carrying a tin pail. The care of some captive crabs weighed upon the mind of Freddy, and brought him forth at this early hour. In exuberance of glee, Janet kissed the widower's son, admired the crabs, and invited him to run a race. Flying over the strand, with the boy in hot pursuit, Janet climbed a ridge, and discovered a sheltered cove beyond, where the water spread a crystal shield, the surface flushed with delicate rose-tints of dawn, and dimpled over the white pebbles in transparent ripples.

"Let's paddle," said Freddy, spurning the restraints of shoes and stockings, and allowing the foam to curl about his pink toes.

Now Janet Maby did not at all appreciate the honor done her by being elected a mate of this little man, who occupied a position of peculiar glory. Toys and bonbons were showered upon him; caresses surfeited him; little notes were written to him by absent young ladies, bidding him reply to his attached friend Amelia or Sophia; he was allowed to rend flounces and play pranks without a murmur. These attentions were received somewhat dryly by his grandmother, and with a quiet smile by his parent.

"Is it very nice, dear? How I should like to try!"

"Come along, if you ain't afraid," quoth Freddy, wading valiantly on to the height of his own knee.

The temptation was too great. Janet's slippers lay beside the sturdy little boots, and the foam kissed her slender feet. Clamshell Point could offer no better fun. There was much splashing and merriment. Then Janet's bared white arm dipped far down in search of silky tangles of sea-weed.

"Hulloa! there's pa."

Janet's dismayed glance flashed back to shore. A gentleman stood watching them.

"Tell him to go away," faltered the girl.

"She says to go away," shouted Freddy.

Mr. Dale vanished. Surely he might have given her time to scramble over the wet stones, dry Freddy's feet with her handkerchief, and invest them in the sturdy little boots again. But he was back before the last button could be fastened.

"Is the frolic over? Ah, you have cut your foot on a mussel!"

"No matter," was the petulant response, the injured member being hastily withdrawn from sight. It was a pretty foot, small, arched, and shaded on heel and sole like a shell—perhaps Janet's chief beauty. Vexation brought a wealth of color to her cheek. Why had she not remained in bed, instead of straying out to be beguiled by Fred?

"Let me do something for you," he said, soothingly.

"No." Her gaze was fixed obstinately on the distant sails.

"Miss Maby, do be sensible. What am I to do for the wounded foot?"

She opened wide her brown eyes, and studied the stern face, dark in hue, with clear-cut features and hair tinged with gray. The housewife was mightily miffed at this mode of address. Lack of sense, forsooth!

"Pray go away. Can't you see how much better off I shall be without you?"

Whereupon Mr. Dale rose stiffly, giving his hand to his son and heir.

"I like her," observed Freddy, skipping a pebble.

"Better than the other young ladies?" questioned the artful parent.

"Yes."

"Why?"

"Oh, cos I do. I mean to take her to ride with pony. See the sandpiper, papa!"

Janet ignored Freddy for two days, much to that young gentleman's astonishment, and avoided Freddy's papa persistently. The widower's son could find no parallel in his extensive experience for such treatment; indeed, he was rendered speechless when his invitation to drive behind a stumpy pony was refused.

"The young clergyman is to be envied," thought Mr. Dale, with ruffled vanity, and yet feeling a vague curiosity in the study of Janet. A man thus placed passes through three successive stages of feeling when he meets with tacit dislike in the other sex. He is astonished, then deeply offended, then desirous of effacing the unfavorable impression he has made. Janet was ignorant of these delicate arts of diplomacy. Mr. Dale represented mortification; she had been caught in an unlady-like act. What did he think of her? Intimacies ripen at Clamshell Point. Ilma Lamar became very affectionate toward the "new girl," finding many occasions to discuss Horace, dwelling especially on his flirtations. This was calculated to disabuse Janet's mind of any illusion such as that he had fallen in love with herself. Every drop of water has its millions struggling for mastery. Clamshell Point was a tiny sphere inclosing its scheming atoms. Horace followed Janet assiduously, and it was not in reason that she should not sometimes encounter Mr. Dale in the corridor, or under the pine-trees.

"She is not engaged to the young clergyman. That was one of Ilma's fibs," said Horace, eagerly.

"My dear fellow, you can not expect me to be equally interested," said Mr. Dale, superciliously.

Forthwith he waylaid Janet, with outstretched hand.

"Are we to be friends?"

His glance thrilled her. Freddy's preference and her own indifference had been the hammer and anvil to smite this vivid spark. That look haunted Janet; it was like some sudden revelation. How strange and unreal the people about her seemed! as if she trod on clouds, was admitted to a world of which they knew nothing. She shrank away from the other young people; she snubbed Horace, whose gayety jarred on her. Solitude and leisure to think became necessary to her. At this juncture, in the most accidental way, Lady Kew said,

"Geoffrey Dale is a fine character. There is something more to him than a velvet coat and meerschaum pipe, which seem to be the chief features of his brother. I wish he would marry again; but it is not probable. He can not replace his first wife readily."

"Was she so beautiful?" demanded Janet, looking out the window very steadily.

"Oh! lovely in every respect."

The girl sighed softly in the darkness, and when she met Mr. Dale again there was a certain wistful sympathy in her manner, which he was not slow to appreciate. This increase of confidence did not make her happy, apparently, for she became very quiet. The annual Clamshell picnic transpired. The anchor of the small yacht was weighed. There was a band on board, and although the heat was intense, there was dancing. The oldest boarder said that if one really desired enjoyment, the "Point" was the place for it. Who so jaunty and trim as Ilma Lamar? She sang airy French songs, and kept the gentlemen about her, having even a bon-mot for the married men. The buoyancy of spirit of that sweet child, Frederick Dale, led him even to dropping star-fish down the spine of nervous ladies. Janet tried to enjoy herself; so did the others. Despite sun-blistered faces and headache, they made a noble effort, but their courage sank with the setting sun. The oldest boarder fanned himself with his hat, and pronounced it rather warm. Dancing was resumed on deck; lurid masses of cloud swept toward the zenith, and loud above the fiddles rolled the thunder. Ladies and children were driven below, wailing in chorus. Rain poured; hail crashed like icy bullets; the lightning dazzled. The frail cockle-shell of a boat seemed about to vanish in a black abyss. If the oldest boarder could have made himself heard he would have stated that such a storm had not been known for twenty years.

Janet became desperate. Watching her opportunity, she darted on deck, and crouched there. A sense of solitude smote her; families clung together in peril, and she was alone. A prayer welled up from her heart. Only deliverance and safety this time. Lord! there seemed so much to live for, so many tasks unwrought by strength and hope!

Then, as in a dream, a sheltering arm was cast about her shuddering form, and a tender voice spoke to her:

"Janet, if this is to be the end, let me know the truth. Could you love me, darling?"

"Yes," she whispered, tremulously; and amidst all the confusion incident to the storm Geoffrey Dale heard her answer.

The two faces touched softly in the darkness, when a second head appeared in the hatchway, and a white hand clutched Mr. Dale's shoulder.

"Oh, I am so frightened. It is terrible below. Do take care of me, Mr. Dale."

Ilma Lamar thus claimed help in piteous tones. Janet placed her between them reassuringly.

So the hour of suspense wore on, and they were saved. The storm lulled as suddenly as it came. When the moon shone forth it was to illumine a droll scene: a number of

human beings were dropping recklessly overboard from a small yacht, and wading through shallow water in dismal procession. Ilma linked her arm through that of Janet.

"How nice to be on shore again! Will you keep my secret? Geoffrey Dale wishes me to marry him."

"You?" gasped Janet, with an involuntary glance back at the man who was carrying drooping Freddy.

"Yes, indeed," laughed Ilma, now feeling sure of her ground. "The matter has been pending a long while, and he is really fond of me. Have you never heard of it? I believe I will be married in white faille."

"How hard you have worked to obtain a little pleasure!" said Lady Kew, sarcastically.

The oldest boarder disappeared amidst rumors of cramp. With a white, set face, wearing a look of confusion and pain, Janet replied mechanically to her kinswoman's greetings. She was so stunned and shocked that she scarcely knew what she said. Lady Kew rose and took her by the arm in the most natural manner possible.

"We must go to bed and recover our bloom. Besides, there is a letter from home."

"Bad news?" questioned the girl, quickly.

"Your mother is ill."

Janet passed Geoffrey Dale, with her eyes fixed on the ground. Her heart swelled within her at sight of him. How cruel and unnecessary it all seemed! She had been made the sport of Ilma Lamar's affianced husband. There are natures so candid and truthful that the very audacity of a falsehood carries conviction. Half an hour later the girl was kneeling before Lady Kew's chair, imploring,

"Let me go home. They need me, and I am out of place here."

"You shall go by the morning train," said Lady Kew.

Not a word of complaint or confession had escaped Janet's lips, only that look of amazement and suffering. Do you imagine that this wise old woman did not know? She asked no questions painful to answer, but she divined the cause; and as she smoothed the girl's hair with one little yellow claw of a hand, a haunted expression came into the old face. Ah, the tender romances shrouded in fading eyes, the heart memories stirred by the sight of youthful, sharp despair! A strange smile rested on the pinched features; regret mellowed to retrospection smoothed out the lines of worldly wisdom and humor with a gleam of transient beauty.

Next morning Geoffrey Dale paced beneath the windows of Janet Maby's room, glancing impatiently at the closed blinds. Verily, the widower must have been quaffing the elixir of life, his whole bearing was so animated and happy. Freddy had been banished on a long walk with nurse. Mrs. Dale, with a general aspect of faint sourness, went

her way as usual. He had found a diamond among all the paste at last. Janet might take the place of that shadowy wife of the past without dishonoring her memory. When would the fair, sweet face smile a morning greeting?

"So it is you, my gentleman," quoth Lady Kew, chuckling, as she peeped through the shutter. "Then this little checkmate in the game will do you all the good in the world." For Janet was gone, without word or sign, and, the first excitement of outward calmness collapsing, was crying miserably behind her veil in the train, which was bearing her rapidly away from happiness.

Ilma Lamar stood in her window, weary, haggard, and old, after a sleepless night, yet with the game in her own hand.

III.—IN WHICH THE KEY IS LOST.

No. 5 Cottage Place was rapidly going by the board. Mrs. Maby, because of chronic headache, had seldom ventured into the kitchen, and her visits now had a rasping effect on cook's temper. Many were the sins laid to the absent young housekeeper. Miss Janet *would* have cupboards in dire confusion, an army of kettles on the hearth, a coal-scuttle on the lower stairs, and chevaux-de-frise of brooms and dust-pans in the area. Cook made these statements unblushingly, and was so justly offended at an expression of querulous incredulity on her mistress's face that she gave warning on the spot. Result—the Maby family subsisted on lettuce, cucumbers, boiled eggs, and dreadful dishes concocted by Alice out of impossible recipes. Taken in connection with this calamity, that Addy, the maid, fell in love with the butcher's boy, and consumed much valuable time flirting on the curbstone; that Tom, aged four years, drank some Lubin's white rose, possibly owing to the low state of the household larder, with alarming results; that baby strayed away and was lost for a day, being restored at night by a contemptuous policeman in a muddy and limp condition; and that Mr. Maby's confidential clerk was proved dishonest—it may be inferred the machinery of life sadly needed adjusting at No. 5.

A little paler and quieter than before, Janet took up her burden again, and found in work for others—as we all may do—the balm of forgetfulness.

"It is all very well to talk in a superior way about too many eggs to a pint of milk," said pretty Alice, ruefully, at the same time rubbing her classical nose with a floury palm. "You have been to Clamshell Point, and lived in luxury."

"Oh, Alice, I wish it had been you instead, from my heart," said Janet, for the first time yielding to public tears, as she laid her head on her sister's shoulder. And Alice kissed her; in her contrition even patting her on

the back with the rolling-pin. It was not at all a pretty place, that dark kitchen of No. 5; the one dismal little window affording a view of passing boots and ankles in the street above, and the cellar yawning like a black mouth opposite. In her soul Janet knew that never were grief and wrong like unto hers, with the keen despair of a nature unused to suffering, and that element of tragedy peculiar to youth. Sweet hopes had stirred in her heart of being a home centre about whom would cluster the growth of all the coming years. She loved this man, although she had been unconscious of it until he had spoken. All the affection, the heroism, of her nature had gone out to him in the stormy night, leaping up in a torrent, sweeping away the boundaries of previous unconsciousness. Glorious destiny! To live for him, to die for him! Thus do we invest prosaic mortals with the fervor of our own imaginations. For Janet Maby this cold, rather elderly man was touched with a spear of fire.

At the moment Ilma Lamar was tripping over the sands, which reflected the rosy sunset clouds in many a pool and ripple, conscious that a small boy toiled in her wake, laboriously carrying his pinafore full of clams. Her aspect was flushed and eager. Trick worthy of her tortuous brain, perverted reasoning, and fruit of much sensational novel reading: watching her opportunity when Freddy dropped a clam and stooped to recover the treasure, she flung a bit of crumpled paper back on the breeze. Very fresh and pretty was her toilet, for Ilma was always well dressed, thanks to her own clever fingers, and skill with her needle. Geoffrey Dale looked after her trim figure admiringly, as his son tugged at his coat tails.

"Here's a letter I found."

These days were not pleasant ones for the widower. He tormented himself with a thousand dark conjectures. Lady Kew was cool and evasive; his brother Horace scarcely less mortified than himself. The castle of happiness, conjured up by a magician's wand, had faded almost before seen; the cup been rudely dashed from his lips before he could drink. Why had Janet Maby departed without a word of farewell? What right had she to treat him thus? He was in that first stage of displeasure when wounded vanity made him await an explanation instead of seeking one. It was precisely in this mood that Ilma intended to insert her slender wedge of doubt.

"I guess it's from the post-office," hazarded Freddy. The paper was crumpled; on one side was writing in ink, and on the other penciled lines. Mr. Dale read, "Most adorable Ilma," and at the close, "Your despairing slave, Alfred H——" His lip curled. Had not the young lady in question hung on his arm the previous evening, and

declared, in the becoming moonlight, that she had never received a love-letter in her life?

"This is your property, I believe," giving her the letter on the piazza.

"Mine?" airily surprised. When she saw the writing a gray pallor overspread her face. She had staked her all, and lost. Incredible stupidity! She had chosen the wrong sheet, that on which she had composed in pencil a letter to Janet from an imaginary lover. Sudden passion blazed in her eyes.

"We are quits," she said, with a sneering laugh. "Go back to your precious Janet."

"Precious indeed!" murmured Geoffrey Dale.

So it came to pass that one afternoon, when the two youthful cooks of the house of Maby were intent on a supper dish for their discouraged father, who had become moody over the defalcation of his clerk, and also suffered from indigestion after masticating Alice's pastry, a pair of small legs incased in scarlet stockings were observed passing the window.

"Oh, gracious!" exclaimed Janet, blushing violently. She knew the small legs very well indeed.

The bell rang. Master Freddy Dale wished to see Miss Maby. Nothing could have exceeded the composure of this juvenile emissary. He kissed Janet graciously, and presented her with a bouquet of choice flowers. "Oh, and I've got this too!" added the widower's son. "Pa sent it—that's his writing, you know—and he says will you please to answer it."

Janet received the missive shyly, much embarrassed by the scrutiny of sharp young eyes. She might have spared herself the tremors of consciousness so far as Freddy was concerned. He knew nothing about the letter, and cared still less. The day was memorable to him because he was invested in knee-breeches—petticoats were now spurned forever by the embryo man—because his father had promised him a new kite, and because his grandmother had subjected him to a series of frantic embraces, and then retired to a corner to melt into tears. Beyond these strictly personal considerations, he was prepared to take a lively interest in the affairs of the Maby family as a new field. Before Janet had broken the seal of the letter, on which hinged all their future, he had climbed on a chair to frighten the canary, and brought down the one article of vertu the room boasted—an exquisite vase. Janet read the letter with quivering lips and tear-dimmed eyes; but as it was her very own, we may not also read it. Before she had finished her mother's arms were about her. How to answer? There were whispered consultations, and then Mrs. Maby dipped pen in ink with great apparent firm-

ness to indite the reply. Janet knelt before Freddy in wistful deprecation.

"Will you try to love me, dear?"

Freddy's response was a dry laugh, as he departed. It did not become a young gentleman so recently elevated to the dignity of knee-breeches to make rash promises.

Oh, tender the twilight in that little parlor! How easy explanations made in low caressing tones, with hands clasped, and eyes searching other eyes trustfully!

Alice stood in the door pensively, wondering what it was like to have a lover, when a stranger approached.

"Miss Maby," he began, raising his hat.

"Yes," returned Alice, demurely, giving her blue muslin a swift feminine smooth.

"Your sister—"

"Is engaged." Then they both laughed, and became friends.

What was Horace Dale seeking? He scarcely knew. What he actually found was our pretty Alice, with the rippling golden hair and dimpled chin. Availing themselves of the situation, it is quite wonderful how much they discovered to say to each other. It was dark when a carriage drove up, and Lady Kew alighted. She paused on the threshold, more like a fairy godmother than ever, and peered into the parlor.

"So you two men have got here before me." Then she added, in Humphrey Maby's ear, "I managed the whole business. Bless you, yes. But they will never know it."

Janet came forward radiantly happy.

"Have you remembered to take your milk-punch at noon every day?" placing a hand on her kinswoman's arm.

"All the better for you, mind, if I forget, for I have made my will in your favor," replied Lady Kew, with a grimace.

CANZONE.

By ALFRED H. LOUIS.

Is it some life-elixir I quaff,
Or do I but hear a woman's laugh?
Is it of woman, or some strange bird
Whose breast by a sweet woman's soul is stirred?
Or cry of some angel, caught in the mesh
Of glorified, purified human flesh?
Or is it the pulse of some new sun's beam
Smiting the face of life's quivering stream?
Or is it the voice of some long dead Spring
That must once more to the sunlight cling,
That with blossoming wings and brow appears,
Rising from grave of the world's young years;
When the Hours not yet had sharpened their sting,
When hearts could speak and souls could sing;
When innocent wonder gazed from the eyes
Ere the lamp was trimmed and the brain was wise;
When child was man and man was child,
And untamed Earth with delight was wild?
Can a mere woman's cry turn life's page white,
And flood my head with supernal light,
And, for a season, make me forget
That faces ever with tears were wet?
No. I hear not merely a rippling laugh;
'Tis some life-elixir my soul's lips quaff.
And the voice is not voice, but a flash and a sign
From some world more divine.

ARMY ORGANIZATION.*

BY GENERAL GEORGE B. M'CLELLAN.

[Third Paper.]

HAVING concluded our last paper with a general account of the methods of obtaining recruits, we will now very briefly state what is done with them. In the English service each regiment has its *dépôt*, which sends out recruiting parties for the regiment, and receives the recruits for instruction, so that when they join their regiments they are generally fairly disciplined and instructed. In our service most of the recruiting is for the general service, and not for particular regiments, except in cases of re-enlistment at the post where a man has served, or chance recruits offering themselves at a post. It is true that men are specially enlisted for the cavalry, but the government does not always hold itself bound to keep its part of the implied bargain. The recruits made by the general recruiting parties are collected at a few principal rendezvouses or stations, where their instruction commences immediately, but they are generally assigned to regiments before they have acquired any great amount of discipline or knowledge. Many of our best officers have thought that a considerable extension of the system of enlisting for particular regiments would be very beneficial, and that something akin to the English system of regimental *dépôts* would be very desirable. In Italy the conscripts are frequently sent to regiments serving in a part of the kingdom remote from their native province. Thus conscripts from Sicily and Naples are sent to Piedmont and Lombardy, while those from the latter places are sent to the south. It is said that very beneficial effects result from this course in hastening a real feeling of Italian unity, and in giving to the ignorant and slothful natives of the south some practical ideas of the advantages of the education and energy of the people of Piedmont and the north.

Under the new French laws recruits in time of peace are assigned to regiments serving elsewhere than at their homes, but when they have completed their service with the colors, and take their places on the reserve, they are assigned to regiments serving as near as possible to their homes. The purposes thus sought to be accomplished are to render the active army national by bringing together in the same regiment men from different parts of the country, and, on the other hand, to render mobilization prompt by the regional system of reserves.

In Germany the whole system of recruiting and reserves is on the regional basis, except for the Guards. The empire is di-

vided into as many regions as there are army corps, less the Guards Corps. Each of these regions furnishes the recruits and reserves needed for one army corps, and this army corps, in addition to its number, takes also the name of the region or province in which it is stationed and recruited—as, for example, the Second or Pomeranian Corps, the Third or Brandenburg Corps. The Guards Corps is recruited from all the Prussian provinces, and its reserves are the men who passed their active service in its ranks.

For the purposes of military administration in regard to the recruits and reserves, each region is subdivided into "Landwehr battalion districts," there being two of these districts for each regiment of infantry of the line. These two battalion districts (forming a Landwehr regiment) have to furnish the recruits for the corresponding regiment of the line, also the proper quota for the Guards, and the proper proportion of men for the rifles, artillery, etc., etc., of the army corps of the region. As the several army corps are essentially equal in strength, it is just that the regions should be equal in population; as originally established they were very nearly so, but the increase has been unequal. By means of the organization of "reserve Landwehr battalion districts," and other arrangements which we have not space to describe, these inequalities are provided for, and justice to all secured. Each Landwehr battalion district has a permanent district staff, which is not the staff of the mobilized battalion. It is the duty of this permanent staff (which remains at its post in war, and does not accompany the mobilized battalion) to keep in order the clothing and equipments for the men belonging to the battalion, to keep the lists of the names and residences of all about to become liable to the conscription, of all soldiers on furlough, of the reserve men and Landwehr men of the district. It is to them, in connection with the civil authorities, that the duty is committed of enforcing the attendance of conscripts and reserve men when called for. They see to their proper equipment, and dispatch them to the head-quarters of the regiment to which they belong. In addition to these and similar duties, which will naturally suggest themselves, the district staff officers keep a list of all the horses in the district, so that in the event of sudden necessity all may be ordered in for selection for army uses. In time of war the Landwehr infantry men may be used to fill the gaps in the regiments of the standing army, or, being formed into

* Continued from the June number, page 111.

VOL. XLIX.—No. 291.—27

Landwehr battalions and regiments, may be used as such in the front line, or in sieges, or as garrisons at home, or to cover lines of communication, guard prisoners, etc., thus relieving the troops of the line to that extent. The cavalry Landwehr men are also in time of war formed into regiments. The Landwehr men of the artillery and pioneers are not formed into Landwehr batteries or companies, but are used in filling up the batteries of fortress artillery, and for the formation and completion of reserve batteries of foot artillery and pioneer companies for garrison service. Experience having shown the percentage of losses in campaign for the different arms of service, it is made the duty of each Landwehr battalion district in time of war to forward to the corresponding line regiment, without any special requisition, the men required to maintain the companies at their full strength.

When the war of 1866 broke out too few years had elapsed since the last changes in the organization of the Landwehr and the increase of the standing army for the accumulation of the reserves necessary to supply all the wants of the regular regiments. It was therefore necessary to transfer many Landwehr men into the standing regiments, as well as to embody large numbers of Landwehr regiments and bring them to the front. In the war of 1870, however, the new system was in full operation. Without any extraordinary measures being resorted to, the reserves of the first class sufficed alone to maintain the field army of the North German Confederation always at the full strength. The orders for mobilizing the army were issued on the 16th of July, and so complete were all the arrangements for calling in the reserves, for arming and equipping them, and for transporting the troops by rail, that on the 4th of August the army of the Crown Prince defeated the French at Weissenburg, and on the 6th the same army again defeated them at Wörth, while the armies of Prince Frederick Charles and of Steinmetz defeated the French left on the same day at Saarbrück. In addition to maintaining the field troops at their full strength, there were mobilized during the war 166 Landwehr battalions, 2 reserve rifle battalions, 16 reserve cavalry regiments, 39 reserve batteries, 173 companies of fortress artillery, 33 companies of fortress pioneers, all of which took part in the active operations, chiefly in the numerous sieges, and partly in guarding communications. There were also organized five additional telegraph divisions, one railway division, one torpedo detachment, one balloon detachment, one photographic detachment. There were besides organized for garrison duty and guarding prisoners 72 garrison battalions, each 750 strong, and 53 dismounted Landwehr squadrons, each 250 strong. All this was done without disturb-

ing any of the organizations of the field army, and employing solely thoroughly instructed and disciplined soldiers.

Before proceeding to the subject of the measures adopted to secure proper instruction for the officers and non-commissioned officers, it will be profitable to examine for a moment the general principles on which the German system of reserves is founded, and the chief objects they seek to accomplish; for from these principles inferences may be drawn useful to ourselves, should we ever be so unfortunate as to become involved in another serious war. The governing and most important principle at the bottom of army organization is that, with modern weapons, and as armies are organized and wars conducted at the present time, other things being equal, the superiority must rest with that army which possesses the best organization and the most thorough discipline and instruction; in other words, that such an army as the German must inevitably be successful against such troops as composed the French armies of the Loire. Of course it may happen that in peculiar cases, as when sheltered by permanent defenses or field fortifications, brave men, who are well armed but imperfectly organized and instructed, may successfully resist the attacks of good troops; but such cases are exceptional, and can not in the long-run influence the result of a war if their opponents are numerous and determined, and the field of operations extensive.

From this it follows that, so far as circumstances permit, the regiments, batteries, etc., of the standing army should be sufficient, when filled to the war strength, for all the purposes of field operations, and that means should exist of supplying the daily losses in campaign by a steady stream of instructed men. We may anticipate a little by saying that the same principle clearly applies, and if possible with still greater force, to the officers and non-commissioned officers. It is also true that in time of peace ample provision should be made of such kinds of war material as are comparatively imperishable in their nature, which require some considerable time for their preparation, and which are least likely to become useless in consequence of improvements.

When the circumstances are such that it is either impossible or injudicious to do all these things, then the only alternative is to do the next best thing, but always to keep in view the principles themselves. For instance, when war breaks out the regiments of the peace establishment should at once be filled to the maximum, and the number of new regiments organized should be strictly commensurate with a liberal estimate of the probable ultimate requirements of the war. The greatest care should be exercised in the appointment of new officers; that is to say,

when it is impossible to obtain the requisite number of officers of military education and experience, it should at least be required that they possess those personal qualities of general education and intelligence, activity, energy, and moral worth, that will enable them soon to acquire a reasonable degree of fitness for their new sphere of action. The most prompt measures should be taken to weed out all unfit appointments, and to supply their places by better men. An existing organization should never be permitted to be broken up, or to decline seriously in numbers below the normal war strength; but recruiting should steadily continue from the beginning of the war until the conclusion of peace; the recruits should at once be collected in *dépôts* for instruction, and steadily sent out to the regiments as rapidly as they meet with losses, and even in anticipation of them. One old regiment is worth more than double its numbers of new troops, and a given number of recruits become good and useful soldiers very much sooner when incorporated with old regiments than when organized as new ones; under the care of experienced officers and non-commissioned officers, and with the example of the old soldiers of the regiment, their health and comfort are much better attended to, so that the losses by sickness are much diminished, as well as those in battle. From these causes, and the better care taken of arms, equipment supplies, food, and clothing, a large expenditure is saved by keeping up the old regiments, including those formed at the beginning of the war, to the full standard, instead of forming new ones as the war progresses. Experience has fully proved that there is a vast difference in expense between old and new regiments in favor of the former. It will thus be seen that economy, efficiency in the field, and rapidity in making recruits available are all in favor of keeping up the requisite number of old regiments as against forming new ones, which last measure should never be resorted to unless when the existing regiments, kept filled to the maximum, are clearly insufficient. Again, in a country like our own, if a war should assume such proportions as to render a resort to draft or conscription necessary, the first step would seem to be to determine approximately—as can always be done if the system of keeping up the old regiments is followed—the number of recruits required for current wants, always making the estimate liberal enough for covering unforeseen contingencies; next to determine as closely as possible the number of young men becoming fit for military service each year; then to determine the limits of age, occupation, etc., within which the draft shall apply, so as to injure as little as may be the most important interests of the country, and to relieve married men with dependent families as far as possible, confin-

ing the draft, if practicable, to the unmarried and to the youngest capable of bearing arms. Further than this, substitutes should not be allowed, but all competent men drawn should be compelled to serve in person. We do not for one moment suppose that it is practicable to introduce among ourselves the German military organization, and we would be among the first to deplore the advent of circumstances rendering such an organization possible or desirable; but it is not too much to demand that the principles underlying such an organization shall be applied wherever and whenever possible. Were it within the scope of this article, and did our space permit, it would be very interesting to apply the test of these exceedingly plain and simple principles to the conduct of our War Department during the late war, and to estimate the increased expenditure of time, blood, and treasure that resulted from their violation, and, on the other hand, to estimate the advantages that accrued to our antagonists from their better observance of the same principles. We must content ourselves with expressing the hope that our country will never again witness the painful spectacle of superb regiments of veterans allowed to dwindle down to literal skeletons,—too small to accomplish any other useful result than to show how bravely men could die—while the needed recruits were formed in new regiments, which in turn had to gain the needed experience at a fearful cost; and that we may never again have to blush for the effects of a spasmodic system of drafting, which in the older States too often produced only the worst of soldiers, encouraged the villainy of “bounty jumpers,” and left, as its most enduring result, a “bounty debt” so immense that it is to be hoped, for the reputation of our people, that its amount will never be known; and, finally, that if we ever again send large armies into the field, we may not see the whole business of recruiting suddenly and entirely stopped at the very moment when the serious losses, inevitable in campaign, were on the very point of commencing.

SELECTION OF NON-COMMISSIONED OFFICERS.

In the German army much care is taken in the selection and instruction of the non-commissioned officers. Any soldier who has completed his legal term of service with the colors, and who possesses the qualifications necessary to make a good non-commissioned officer, is encouraged to re-enlist. From among this class the majority of the non-commissioned officers are taken.

In cases of marked merit, and where the number of suitable re-enlisted men is insufficient, men may become non-commissioned officers in their third or even in their second year of service. There are also four schools

for non-commissioned officers, which are filled by volunteers from seventeen to nineteen years of age, who are fitted for their intended positions in three years. The best pass into the infantry as non-commissioned officers immediately upon completing their course, while the others join their regiments as privates or lance-corporals, but are soon promoted. These men are peculiarly fitted for such duties as require especial intelligence and skill in the use of the pen, as quartermaster-sergeants, company clerks, first sergeants, etc., and finally as paymasters. Each of these four schools consists of 19 officers, 46 non-commissioned officers, 500 privates, etc., etc., and is organized in four companies. The Military Orphan House at Potsdam, the Military Institute for Soldiers' Sons at Annaburg, and the eleven garrison schools for the free education of the children of non-commissioned officers, may all be regarded as to a great extent preparatory schools for non-commissioned officers, since many of the scholars eventually obtain such positions.

SELECTION OF THE LOWER GRADES OF OFFICERS.

The necessary supply of second lieutenants is derived partly from the corps of cadets and partly by promotion from the ensigns, or *Porte-épée Fähnricks*.

The Prussian corps of cadets consists of the main institution at Berlin, and six preparatory schools at other places, containing altogether about 1700 cadets. Each preparatory school consists of four classes; the main establishment has the two higher classes, and in addition two special classes. Upon completing the course, the members of the first class—about 200 in number—undergo the examination for promotion as ensigns. Those who fail under the test enter the army as privates; those who pass become brevet ensigns, but about fifty of the best of the class remain another year in the *select class* of the cadet corps, and at the end of that time become second lieutenants immediately, if they pass the requisite examination. Those of the first class who are too young or too weak to enter the army with their classmates remain another year in an upper special class, and then join as full ensigns; these average about thirty annually.

The cadet corps supplies less than fifty per cent. of the vacancies.

The *Porte-épée Fähnricks*, or ensigns, through whom the remaining vacancies are supplied in peace, form a special class of non-commissioned officers, created for the particular purpose of supplying competent officers.

Any non-commissioned officer or soldier, between the ages of seventeen and a half and twenty-three, who has served six months, and possesses the requisite certificate of fitness from his superiors, may apply for ex-

amination as an ensign. It is more usual, however, for this application to come from youths before entering the service, and at the age of seventeen. These applicants are assigned to a regiment, and must serve five full months in a company; if they then obtain from their officers the requisite certificate of moral and physical fitness, etc., they are allowed to present themselves for examination. The obligatory branches are the German, Latin, and French languages, mathematics, history, geography, and drawing. Candidates possessing a satisfactory diploma from an institution in which these branches are taught may be excused from this examination.

The results of these examinations and the certificates of the officers are now sent to Berlin, where the appointment of ensign is made, if the circumstances of the case are satisfactory. As already stated, the cadet corps furnishes about 110 brevet ensigns annually. These young men are assigned to regiments, and become full ensigns if on the expiration of five full months' service they procure the requisite certificates from their officers. Although these young men are now in the line of promotion, they are required to do the duty of non-commissioned officers, and are completely under the orders of the first sergeants of their respective companies. Every care is taken to make them fully acquainted with all the details of the service, the duties of all the non-commissioned officers, the duties, habits, and wants of the men, etc. On the other hand, the officers are desired to associate with them as much as possible off duty, and to give them every aid and encouragement in their power. Those of the ensigns who have not passed through the cadet corps, or in some other manner acquired the requisite theoretical instruction, are sent to one of the seven military schools established especially for them to fit them for promotion; the course lasts nine months. To be allowed to apply for examination as a second lieutenant the candidate must be less than twenty-five years old, and have served at least six months with his regiment as a full ensign. The examination comprises only the strictly military subjects, *e. g.*, tactics, fortification, service in garrison and the field, surveying, drawing, etc. This examination successfully passed, it is still necessary that the candidate should have the written consent of the officers of his regiment to his promotion. Any officers desiring to transfer from the reserve or Landwehr into the standing army must give proof of their thorough acquaintance with the branches of knowledge alluded to above. In the German army promotion is as a rule according to seniority; the exceptions to this rule are usually under the grade of field-officers, and apply to, 1, officers of the general staff corps; 2, aids-de-camp on

some of the highest staffs; 3, officers of the cadet corps; 4, officers specially and very highly recommended by their comrades and inferiors; 5, cases of distinguished actions in war. If an officer is not recognized as possessing the qualifications required in the next higher grade, he is passed over, and usually goes on the retired list. In addition to the means of instruction for officers already mentioned, it will be sufficient to allude to the united artillery and engineer school at Berlin, which provides for the complete education of the lieutenants of these two arms of service.

There are certain schools of practice that should also be briefly mentioned, *e. g.*, the school of target practice, to which are sent annually 60 lieutenants, 135 non-commissioned officers, and 360 men to be qualified as instructors (the course lasts from April 1 to September 30); the model infantry battalion in Potsdam, to which are sent annually 20 officers, 56 non-commissioned officers, and 650 men, in order to insure uniformity in drill throughout the army; the riding-school at Hanover, the object of which is to furnish riding-masters for the cavalry and artillery, and to which each regiment sends one lieutenant and two lance-corporals; finally, the artillery school for target practice at Berlin, and the central gymnastic school in the same place. Our present purpose is answered by merely indicating the existence of these among other similar institutions, as showing the extreme care taken in the German service to perfect the instruction of the army in all details, and to secure uniformity.

We stated in a preceding paper that the company, and the corresponding unit in the other arms, *i. e.*, the battery or the squadron—is the true foundation of the whole military fabric, that within it are performed the most important portions of the interior service, and that the soldier receives therein all the most essential elements of instruction. While the company is the smallest independent unit, it is at the same time the largest fraction whose commander knows all his men by name, and is acquainted with all their personal characteristics, while it is also the largest fraction in which every man knows all his comrades personally: it is the true military family, the head of which is the captain. Subject to the general regulations of the service, and the general orders regulating the drills, discipline, etc., he has the direct and almost independent control of his command. In well-regulated armies no one interferes between the captain and his command, all orders from above passing through him, and all communications from below also going through his hands. His superior officers should confine themselves to such a general supervision as will enable them to ascertain that he does his duty

properly; and whenever they have reason to be dissatisfied, or to require any change in his conduct of affairs, their observations should be made directly to him, and never to any of his subordinates. He is in every respect responsible for the condition of his company, and can not throw the responsibility upon his subordinates, as it is his duty to see that they perform their duties properly and in exact accordance with his views. This being the case, it is just that he should as far as possible have the selection of his non-commissioned officers; in other words, his recommendations in regard to their appointment and the reverse should be affirmed by the regimental commander, except in special cases where there is some grave reason to the contrary. In the German service the grade of captain is the lowest conferring the right to inflict punishment, the lieutenants and non-commissioned officers being limited to placing men in arrest when necessary, and reporting the facts immediately to the captain for his action. It is the captain's duty not only to guide his lieutenants in the performance of their duties, and to mark out their work for them, but also to superintend their instruction and improvement in the knowledge of their profession, that they may become fitted for the functions of the higher grade. For the purposes of interior service the company is divided into squads of from ten to twenty each, every squad being under the immediate supervision of a non-commissioned officer, whose duty it is to maintain a constant watch over the men of the squad to see that all orders and regulations are strictly obeyed; that they take proper care of their arms, clothing, equipments, ammunition, etc.; observe the necessary hygienic precautions in regard to their food, persons, etc.; in brief, it is the province of the non-commissioned officers to see that all orders of the captain are carried out, and to report to him every thing necessary to keep him fully informed as to the condition of the men. Upon the non-commissioned officers also devolves the immediate instruction of the recruits in the school of the soldier, and the first elements of duty and discipline. It is also their duty to act as guides and assistants in the company and battalion drills, to command the small detachments for guard, patrol duty, etc., and in battle to keep the men to their duty, and to aid in carrying out the captain's orders. The immediate superior of the non-commissioned officers is the first or orderly sergeant—in the Prussian army he is called *Feldwebel*—who is the direct agent of the captain, and through whom all orders and reports pass. It is his duty to keep all the company books and records, to make all details, to form the company whenever it is assembled, to superintend the messing of the men, keep the mess accounts when the men

all mess together, etc., etc. He should never be selected from mere seniority, but the most intelligent, trustworthy, and soldierly non-commissioned officer should always be chosen for this position, provided his character is such as to inspire all his subordinates with respect. The senior non-commissioned officers replace absent officers, where necessary, in the command of platoons and other duties.

It is the duty of the lieutenants to assist the captain, and to represent him in his absence. They must therefore endeavor fully to understand his views, and work in perfect harmony with him, and must make themselves thoroughly acquainted with the *personnel* and *materiel* of the company and all the arrangements in force. Usually each lieutenant has the general charge of several squads, but this does not constitute an intermediate authority between the captain and the men, as nothing can be allowed to intervene between the captain and his command. In most armies there is in every company a lieutenant "of the day" or "of the week," whose duty it is to remain at the barracks or camp, to be present at all roll-calls, to superintend all issues of rations, forage, or material, to take immediate action in any sudden emergency requiring prompt decision, etc., etc. In those services where the men are paid daily or weekly it is also the duty of the lieutenant of the day or week to be present when the first sergeant receives the money from the battalion paymaster, and also when the men are paid. At drills the senior lieutenants command platoons, the juniors acting as file-closers. In the field they frequently command detachments, such as advanced guards, strong patrols, outpost guards, etc.

The duties of the field-officers vary slightly in different services. Where the regiment consists of two or more battalions, each battalion commander is charged with the general supervision of the affairs of the companies. He must see that all orders coming from a higher authority are strictly carried out, and that the captains perform their duties faithfully and intelligently; but he must not interfere with them except in cases of neglect or mistakes. He of course assumes the direct command of his battalion whenever it, or the greater part of it, is formed for any duty, whether of instruction or otherwise. The battalion adjutant is appointed by the colonel on the recommendation of the battalion commander. It is his duty to keep all the battalion books and records, to make the various details for duty, to form and inspect the details for guard duty, to instruct the non-commissioned officers in the battalion drill, and, in the winter, in regard to their general duties; he has also the charge of the band.

When there is an extra major with a regi-

ment he is specially charged with the administrative service.

The commander of a regiment is specially charged with the maintenance of the general discipline and the administration of justice in minor cases. He must also superintend the instruction and administration of his command, and must pay especial attention to the instruction of his officers. He gives the general orders necessary to insure uniformity in the instruction of the battalions, and interferes directly with the battalions only under circumstances similar to those which justify the interference of the battalion commanders in the affairs of the companies.

The regimental adjutant is appointed by the colonel, and need not be senior to the battalion adjutants. He keeps all the regimental books and records, makes the details, etc.

In the German army the principle is fully established that every commander of a distinct unit, from the captain of a company upward, is independent and responsible; that is to say, that his superiors have no right to come between him and his command, or to interfere with him in the performance of his duty, unless he shows himself negligent or incapable. Every commander is responsible for the strict observance of the tactics and of all general orders, for the proper employment of the officers, and for the preservation of the health of the men under him; but he must be careful to conduct himself in such a manner that all under him may do their duty with cheerfulness, and preserve the greatest zeal for the good of the service. If the superior interferes unnecessarily or too quickly with his subordinates, he will necessarily impair their efficiency, destroy their interest in the service, lessen their influence over their men, and at the same time impair his own usefulness and dignity. It is especially the duty of the generals to guard against this evil; they should never take the place of the regimental commanders, and issue orders for the minute details of service. Too many orders and too much writing should be avoided as far as possible.

The rule is that each commander has the general control and supervision of all the units intrusted to him, and that so long as his subordinates do their duty properly he should, as much as possible, confine himself to this general control. The principle just laid down will explain sufficiently well the usual duties of general officers under ordinary circumstances; it is only necessary to add that where the larger units—corps, divisions, and brigades—are permanently organized it is the duty of the brigade commander to make at least once in two years a careful inspection of his entire command to satisfy himself that the administration is properly conducted, that the men are fully

instructed, and that every thing is completely ready for passing at once to the war footing. The division commander directs the combined instruction and manœuvres of the different arms of service under him, and is responsible that they receive all the necessary practical instruction for field service. Upon him also devolves the administration of justice in most of the important cases.

It is the duty of the army corps commander to inspect his troops, and to see to it that the generals and field and staff officers under him maintain their places only so long as they are fit for field service, and retain the requisite mental faculties and knowledge of their duties.

It may be well to repeat that for the infantry and the engineer troops the company, for the artillery the battery, and for the cavalry the squadron, are the really independent units which are the foundation of an army, and on the condition of which the efficiency of the army mainly depends. These smaller units are never merged in the larger ones, which are simply aggregations of companies, and which are established for the convenience of the service, and to conform to the principle that no commander should have more than five or six independent subordinates under his immediate orders. It should also be repeated that the system of strong companies—that is to say, of those composed of about 250 non-commissioned officers and men—is rapidly gaining ground in Europe; it now holds in Germany, Russia, and Austria, and within a year or two has been adopted for the Italian army. In France and England it has many and able supporters, but has not yet been adopted. It has already been stated that this number of men has been found to be the greatest that a captain can command efficiently under all circumstances, and which permits him to acquire an accurate personal knowledge of all his men by name and individual character. The economy resulting from this organization, as compared with that of the small companies, has been already pointed out.

We have thus sketched, in a very general way, the main features of army organization, the principal duties and functions of the component parts, and the various methods pursued for procuring the requisite number of officers and men. An army is the most powerful yet the most delicate and complex of machines, and every one knows that the work for which it is intended is of the utmost difficulty and importance. Its importance is measured by the fact that, under Providence, a war, a campaign, or a single battle may, and often does, determine the fate of a nation for centuries, and thus affect the liberties and happiness of families and individuals yet unborn. The task is diffi-

cult, because it requires every member of an army to submit cheerfully to the extremes of privation, fatigue, and danger; to devote all his faculties to his duties; to give up his own will and opinion for those of his superiors; and to be ready to expose his life at any moment. It is clear that a mere *form* of army organization, no matter how perfect in theory, will not suffice to produce good results, and that the frame-work must be animated by a moral force which shall impel and enable every man to do his best.

This moral force, which is often called "the military spirit," includes the various military qualities or virtues, and must be accompanied, guided, and to some extent produced by instruction. Among the highest military virtues—indispensable to all ranks and grades—are devotion to the country and the flag, moral and physical courage, and subordination; besides these qualities, honor, courtesy, and truthfulness in all the relations of life come within the category of military virtues. Bearing in mind how widely individuals differ in respect of moral qualities, it is plain that the exercise of the military qualities referred to can not safely be left to individual impulse, but that some standard rule must be established for the guidance of all, and which shall teach all how to use the qualities they possess or may acquire. This is *discipline*, which, in its widest and most correct sense, involves the knowledge of tactics, regulations, etc., so that "a well-disciplined army" should mean one that is not only obedient, but also well instructed in all military duties. The term discipline is sometimes used in a narrower sense, as about equivalent to subordination, and then means that habit of mind which should lead every member of an army to yield prompt, cheerful, and intelligent but unquestioning obedience to all orders coming from his superiors. This frame of mind is not natural with all men, nor is it equally easy of attainment with all nations. Some individuals and some nations acquire it more readily or through different means from others. Some natures require harsh measures to produce the habit of discipline; but it may safely be said that, as a general rule, the more intelligent men are, the more readily do they perceive the necessity of discipline, and the more readily do they acquire it, especially when they can trust and respect their superiors. The habit of obedience is acquired in the squad, at drill, and in the various duties of the interior service—thus within the company, and under the eye of the captain. Rewards and punishments must both be used according to circumstances; but the better the class of men, the less of the latter. In support of this, the German soldiers are no doubt the most intelligent in Europe, and the German army is the best disciplined (in all senses of the

word) in the world, yet the proportion of punishments in that army is less than in any other. With such men as those who compose our armies in time of war, and with competent officers, discipline is best established through a kind and considerate, but perfectly firm and just conduct; but to establish and maintain an entirely satisfactory discipline among Americans it is quite essential that they should respect and have entire confidence in the knowledge and skill of their officers. With good officers, there are no people more amenable to intelligent discipline than the Americans, none who can so rapidly be made good soldiers, and none who will form a better fighting army. In another generation, after the men who served in our last war have passed from the scene, should it ever again become necessary for our country to raise large armies to meet a sudden emergency, the main danger and difficulty will always lie in the lack of a sufficient number of competent officers and non-commissioned officers. The duration of our last war, as well as its cost in blood and money, would have been vastly reduced had we possessed a sufficient supply of good officers at the outbreak.

Fortunately for us, our antagonists were in nearly the same situation; fortunately again for us, we have no neighbors in a condition to oppose highly organized and numerous armies to the hastily formed battalions we will too probably rely upon.

UNIFORMS.

There are several reasons for clothing troops in uniform; that is to say, as nearly alike as the necessary distinction of arms of service, etc., will permit. In the first place, it is more economical to provide clothing made of similar materials than where there is great diversity; it is also easier to supply deficiencies than when a great variety of patterns and colors are employed. As the occupations and habits of the soldier are very different from those of the civilian, it has been found expedient to distinguish the soldier by his dress; and it has likewise been found conducive to neatness, personal self-respect, and good conduct to make this distinguishing dress ornamental to a certain extent. Further than this, experience has also shown that, especially in armies of some size, it is very necessary that the uniform should present such distinctions as will indicate the arm of service, army corps, division, brigade, regiment, and company to which each man belongs.

The essential qualities of a uniform are that it should be of strong and warm material; that it should fit easily, so as not to interfere with rapid or violent movements; that it should be so cut as to protect the more delicate portions of the body; and that the colors, while distinctive and pleasing,

should not be such as to attract attention at long distances, or present too conspicuous a mark at short ranges.

The gorgeous and varied uniforms which in the past added so much to the brilliancy of European reviews and royal balls are fast disappearing before the practical spirit of the age.

WEAPONS.

It is hardly necessary to state that in nothing relating to military affairs during the last few years have the changes been so great and so important as in respect of fire-arms. When the Mexican war broke out—less than twenty-eight years ago—our army was justly regarded as at least as well armed as any other in the world; yet at that period the old flint-lock musket had just been superseded by the percussion smooth-bore musket, which was regarded as the best possible weapon for infantry of the line; a very limited number of troops were armed with the short and heavy "Mississippi rifle;" the Colt revolver was not yet introduced in the army, but the old smooth-bore horse-pistols were yet in vogue; rifled cannon were unknown, and the field batteries consisted entirely of smooth-bore bronze six and twelve pounder guns, and twelve and twenty-four pounder howitzers. Now the rifled weapon has every where in Europe superseded the smooth-bore, and the breech-loader has in all Continental services taken the place of muzzle-loading small-arms and guns. It is perhaps hardly an exaggeration to say that the changes just recorded are quite as great and important as that from the bow to the musket. The effects of the last changes have not yet made themselves fully and universally felt, but enough is already known to justify the assertion that the result must be an entire change in the method of handling troops in battle, and probably important modifications in the organization of armies. It seems very certain that the new weapons, and the corresponding manner of fighting, demand a higher order of intelligence and better discipline and instruction than did the old. The greatest effect of the new weapons consists in their enabling men to deliver a rapid and crushing fire at the decisive moment and place; this will always give the advantage to intelligence and discipline, and the future will probably show that comparatively small armies composed of picked men very thoroughly disciplined will possess greater advantages than ever before over large masses of inferior quality and discipline.

The long ranges and rapid and accurate firing of the small-arms and field-guns of to-day have seriously affected the uses and mode of employing the different arms of service. The employment of large masses of cavalry on the field of battle will probably not again occur, unless under some very exceptional

circumstances, for where the ground is sufficiently open for them to form and act they will be fully exposed to such a fire as will prevent their advancing, or even retaining their position. The experience of the war of 1870-71, as far as it went, proved that cavalry could not attack good infantry armed with breech-loaders without incurring certain destruction. Again, in reference to the other duties of the cavalry, such as escort and patrol duty, it is quite certain that the breech-loader will enable very small parties of infantry to at least annoy cavalry parties so much as to hamper them exceedingly in their operations. The fact that small parties of the German cavalry ranged so far and freely in France will not serve as a rule for other cases. In a moderately broken or wooded country two or three good men with breech-loaders could, with entire safety to themselves, very soon put an end to the movements of ordinary cavalry patrols. It is quite probable that the future changes in the cavalry organization will be in the direction of assimilating a large part of it to mounted infantry.

While the cavalry has lost something of its importance, the artillery, on the other hand, has gained in power and independence. The breech-loading field-guns can be so readily placed under cover and fired so rapidly that it is possible to place them in positions that the old muzzle-loaders could never have held, and also to trust them to themselves with very slight infantry supports. In 1870-71, especially in the latter part of the war, the German artillery was usually in advance of the infantry line, and often really decided the battle when practically entirely without their infantry supports. The changes now being made in Europe seem to be in the direction of small calibres, heavy charges, flat trajectories, and long ranges; all this accomplished by means of a material so light that it can pass over rough ground, and find positions almost anywhere. A consequence of all this will probably be a large increase of the relative strength of the artillery. In regard to the mitrailleuse and similar inventions for the rapid and concentrated discharge of small-arm bullets opinions vary exceedingly. There is reason to believe that the last war did not impress the Germans with a very high idea of the value of such weapons, but that they have reached the conclusion that in face of active and accurate and long-range artillery the mitrailleuse can accomplish very little. There seems good ground for believing, however, that for the defense of works, of defiles, or of a position of limited extent the mitrailleuse, or, still better, the Gatlin gun, will prove to be a very reliable adjunct.

The effect of the modern improvements upon the infantry has been no less marked than upon the other arms of service. If, on

the one hand, their new weapon has freed them from all danger from the once-dreaded cavalry, on the other hand the new artillery is so formidable as to render a resort to new formations and new methods of attack obligatory; for the dense columns and successive parallel lines of former years can not withstand the distant, rapid, and accurate fire of modern guns. Neither can those old formations possibly succeed in the attack of positions held by good infantry armed with breech-loaders. Destruction and wild disorder must be the results of any such attempt.

Before touching upon the measures now being adopted in Europe to meet the new conditions of modern warfare, it is necessary, for the benefit of the general reader, to describe very briefly what is meant by strategy and tactics.

Strategy is the highest and most important branch of the art of war, requiring an accurate and extended knowledge of all branches of the profession of arms, and the highest intellectual gifts. Although its principles have guided great commanders from time immemorial, it has been reduced to the form of a science, and its principles clearly expressed in a scientific form, only within a century. Wars have been successful where the victors violated the requirements of strategy, but only when the conquered departed still more widely from them, or were greatly inferior in respect of quality, or number of troops, or some other vital need. It is the province of strategy to arrange plans of campaign, and to regulate the movements of armies in such a manner that their operations may produce the greatest possible results. For example, when war is about to break out, it is within the domain of strategy to determine whether to take the offensive by marching into the enemy's country, or to assume the defensive, receiving his attack on the frontier, or in rear of it, as the circumstances of the case may determine. Again, when an army is about to assume the offensive, there are usually several lines of operations available; strategical considerations decide which shall be used, and, if more than one, how the disposable forces shall be distributed between them. It is also within the domain of strategy to select the objective points or lines the possession of which—as the result either of strategical movements or of battles—will probably prove decisive in the campaign. While strategy thus occupies itself with the general movements of masses, tactics concerns itself with detailed movements. For example, under the head of tactics come all the measures necessary to move troops from the encampment or bivouac and set them on the march; to pass from the order of march to the order of battle, and the reverse; to pass from one order of battle to another; from

one part of the battle-field to another; to attack the enemy, or receive his attack, etc.

Modern improvements have not changed the principles of strategy in the slightest degree, although they have modified the application of those principles, through the introduction of railways, steam-ships, the telegraph, etc. With regard to tactics, however, the case is very different. The principles of tactics and the formations of troops for combat must, of course, vary with the weapons employed. As fire-arms have been gradually improved during the last thirty years, the systems of tactics of most nations have gradually but insufficiently changed, tending toward quicker movements and looser formations; but with the development of the full power of the breech-loader we are on the eve of a very great change in tactics; and, strange to say, the nation that led the way in the use of breech-loaders is also leading the way in the adoption of the new tactics proper to meet the changed state of the case. Let us separate, in our hurried description, the defensive from the offensive tactics.

When acting on the defensive against troops armed with breech-loaders, the new system requires infantry and artillery to seek cover as much as possible. If the nature of the ground permits them to find it behind the brow of a hill, that is availed of; if otherwise, then it is obtained by the hasty excavation of a shallow ditch—throwing the earth in front to form a parapet—in which the men lie, or the guns are placed. In a wooded country timber answers the same purpose. In the disposition of the troops it is no longer so necessary to preserve continuous lines, and, instead of massing large reserves in a few points, more numerous and smaller reserves are posted wherever the accidents of the ground will afford them shelter. In regard to the offensive, the problem is to expose the men as little as possible to the enemy's fire. This end is accomplished by bringing the artillery into action as soon as possible, and after its work is effected, sending forward the infantry in parties of such size that each can readily find shelter, and move rapidly from cover to cover. Experience seems to have proved that the large company is the most convenient unit for this kind of work; and according to the orders now in force in the German army, no larger column than that of the company is to be used by infantry under fire. Thus, under the new system, infantry attacks will be made by swarms of company columns, each covered by its own skirmishers, every four companies under the superintendence of the battalion commander, every three groups of four companies under their regimental commander, etc., etc. This kind of work requires great intelligence on the part of the captains and their men in finding the best

and most sheltered routes to their objects of attack, as well as in securing harmony of action with the adjacent companies. Again, such fighting necessarily means loose order and a departure from the conventional formations of the drill ground, whenever the field of battle is wooded or broken; hence arises the necessity for a discipline of the most strict and highest nature, which will preserve authority and mutual reliance even in the most scattered order, will cause the men to rally to and obey the nearest officer or non-commissioned officer, and in the first pause of the fighting to seek their own company, or if that be impracticable, the nearest company of their own battalion or regiment.

So also with regard to the artillery, in the new state of affairs more independence of action will be left to the individual battery commanders, all working together toward a common end under the general direction of the division commanders. The cavalry also will no doubt find its most useful action hereafter, as a rule, in small bodies, where the squadron will play a principal part as an independent unit. While stating clearly the changes in tactics that have resulted from the introduction of the breech-loader, and the additional importance gained by the company, the battery, and the squadron, we desire again to lay the strongest possible emphasis upon the fact that this change renders necessary the strictest and most intelligent discipline, and that, far from reducing the importance of the battalion and regimental commanders, it simply modifies the character of their duties, really rendering them none the less important; for while they no longer interfere in the details of the captain's work, so long as he does it properly, it is their duty to watch that their captains commit no errors, and to direct all the efforts of the companies to a common end, and to co-ordinate the movements of each battalion with those of its neighbors. To dispense with the regimental or battalion organization would be a fatal error.

In closing these papers upon army organization, the writer feels that it is just to himself to state again that they are intended only for general readers, and that they do not profess to treat the subject in a scientific or exhaustive manner. The sole purpose has been to describe, in language as simple as the subject permits, the main features of army organization for the benefit of those outside of the army, omitting many details that would not interest them, and not attempting minute accuracy when a general description conveys the idea sufficiently well for the special purpose in view.

Written as these papers have been in the few leisure moments occurring while traveling, with very little in the way of books of

reference at command, they are comparatively imperfect, but not too much so, it is hoped, to accomplish their main object, which is to convey to such of the general public as may take the trouble to read them a fair understanding of the structure of the armies that have played so important a part in the affairs of modern Europe. Such an understanding will suffice to convince most men that a modern army can not be improvised out of nothing, and that a mass of brave but undisciplined and uninstructed men does not form an army. It will, moreover, make it quite clear that any nation which can not be perfectly assured of perpetual peace, which can not learn the secret of keeping closed forever the doors of its own special temple of Janus, must make up its mind to maintain a military academy and a standing army which shall not only suffice for the ordinary demands of peace, but even be so much larger as to furnish a nucleus commensurate with probable wants in time of war.

ALLEGRETTO.

"A STRANGE thing, Langley's absence?" So thinks Harry Thornton; so thinks George Renouf.

Closing the door in questioning silence, the young men find themselves in a room not large, but characteristic of its owner in every detail.

That Langley is an artist a glance suffices to show. Whether music or painting is the shrine of his devotion would be less easily determined.

Warm crimsons and maroons prevail in the Brussels carpet, the heavy silk curtains, comfortable lounges, and inviting arm-chairs. Pictures, large and small, cover the neutral-tinted walls—one or two fine oil-paintings; a wonderful photograph of Rembrandt's mother, taken from the original in the Belvedere; crayon sketches; lovely chromos; odd arabesques; bits of bright color—autumn leaves, studies of ferns, rock mosses, and wood lichens; Wagner's superb head, regal in its proud kingly beauty; a full-length of Liszt in his abbé's dress. Schumann and Mendelssohn give no hint of disagreement; Chopin and Schubert gaze at each other in harmonious silence. An easel holds an unfinished picture, a woman's head of exquisite beauty, just sketched on a background of clouds, light and fleecy as angels' wings. Quaintly carved brackets in every nook and corner hold gems of art and beauty—wonderful Clytie in marble, Pallas Athene in bronze; wood carvings from Oberammergau, ivory ones from Japan; slender vases, crystal and silver, never without a bud, a spray of heliotrope, a tuberose, or a scarlet geranium—so womanish and delicate were Richard Langley's fancies. On the table,

inlaid with variegated marbles, Thibault and Reichardt jostled Morris and Brown; Ruskin and Schlegel are on good terms with *The Vision* or *Sir Launfal* and Joaquin Miller. At last the eye rests on a glorious Erard, one of those grand pianos that always wear the aspect of distinguished foreigners. It seems to look askance with smothered jealousy at the Chickering upright filling the corner at right angles with its alcove.

Once having strayed to this corner, there is no possibility of mistaking the profession of our friend. Poetry and painting might be his amusement, but music is his life-work. Music every where, bound and unbound, in rows on the book-shelves, in piles on the little Japanese stands—even the fragile cabinet held the Schumann and Franz Lieder—all in that order which in Richard Langley's mind was plainly Heaven's first law.

On the piano was the well-worn score of *Lohengrin*, open at "Das süsse Lied." One could almost fancy the echo of the final chord yet lingered on the air. The whole room, in fact, wore the aspect of abrupt departure. How recently had been that departure Thornton and Renouf were endeavoring to decide. The latter spoke first:

"He must be back in a few moments. He can not be far away. See, the piano is open; the lights, you say, were burning when you came in; here on his easel is an unfinished picture, a thing he never allows to remain when he leaves the room; even that jealously guarded cabinet is open. I never saw the doors unlocked before."

"All that argues abrupt departure, but it can not have been to-night; it was not even dark when I came in, and every burner was lighted then as you see it now. To-day has been very cold and damp, one of those east winds Langley always calls the essence of salt and icicles. Had he been home to-day, a fire would be burning, or at least the remains would be visible. There has been none for a week; there, among the kindlings, is the very roll of dismal counterpoint he snatched from my hands in disgust on Monday. Yesterday was warm, he would not have needed a fire. I think he must have been called away suddenly last evening, and something unforeseen has prevented his return. I shall stay here, at all events. I could not settle down to any sort of work if I went home. There is something so strange and incomprehensible in it. Can't you remain also for an hour or two?"

"Must give up my evening pipe if I do, I suppose?"

"Yes, indeed; I should as soon think of smoking in church as in any room of Langley's."

"Let us look round a little and see if we can discover any clew."

"I don't like to meddle with things, intimate as we have been for years. I never

yet ventured to take any liberties with him or any thing belonging to him."

"Oh, you are too fastidious altogether; I have no such scruples, and shall use my eyes as freely as I like. Of course I wouldn't open drawers and cupboards, nor unroll precious manuscripts; but there is surely no sin, for instance, in looking at the picture of a pretty girl."

As Renouf spoke he took up from its resting-place on the edge of an open drawer in the cabinet a small photograph, evidently the subject of the sketch on the easel.

"Who is this, Thornton? Mighty pretty girl, at all events. Langley has good taste, though I never gave him credit for much appreciation of the fair sex. Has he a sister, do you know?"

"I think not. Let me see the picture. Strange I should never have seen it before."

"Don't you call it a pretty girl?"

"No."

"No? Where are your eyes?"

"Serving me more truly than yours. It is not a pretty girl's face at all, but a woman's—one who has lived and suffered."

"At your fancies as usual; all that from a bright, comfortable-looking picture of a girl of fifteen. See, it is not even a likeness, it is a fancy head; the name below just describes the happy-go-easy, enjoy-life-all-you-can look on the face—'Allegretto,' a companion piece to those charming heads of Hunter's, 'Allegro' and 'Penseroso.' Here she is to the life."

Renouf seated himself at the piano, and with his limpid clear touch gave one of Haydn's allegrettos, running into another of Mozart's, bright and joyous, pure as summer sunshine, like the fresh blue of the sky in June just flecked with cloudlets. One thought of tiny brooks running by flowery banks, stealing in among shady nooks, lingering only for a moment there, loving the sunlight and brightness far better than shadows and hiding-places; birds singing in the woodlands, waving grass, and daisied meadows; nature in placid calm enjoyment, and a heart free from sin and care, in perfect keeping and accord with it.

"That is my interpretation; now let me have yours."

"Do you indeed see nothing more in this face? I have been studying it while you played. I think at fifteen the girl might have been just that and nothing more. I am sure you must add ten years of life to put into the face what I can read so plainly there. The first glance gives just what you describe, but behind it, looking out from the mask of quiet and apparently happy calm, is another face, another look, so restless, so full of pain and longing, so tense with repression and hopeless striving, that my heart aches at the very thought of the suffering it betrays. Do you not feel as well as see the

far-away look in the eyes, seeming to seek that rest and peace beyond, which in some way the life here has failed to bring?"

"If you read the face aright, then Langley has made a strange mistake for him. The handwriting is his, and it ought not to be 'Allegretto.' 'Andante con moto' would be more apt."

"You are wrong still, my friend. You are not the first who has failed to comprehend the full meaning of Allegretto. Listen to me now."

In soft, low, lingering tones Thornton began the second movement of the Sixth Sonata, that wonderful poem so few have ever comprehended. Exquisite as his playing always was, the very poetry of music fell from his slender fingers as they crept over the keys with that rare legato touch Beethoven himself possessed in such perfection. To his listener it was a revelation and a study. Through the marvelous modulations—aspiring, stirring, forever reaching forward to that which is still beyond, failing, falling only to rise yet again and strive yet more earnestly—the pain becomes at last insupportable. Two bars of silence. Gradually the soul comes to itself, and asserts its strength and dominion; mightier is that soul than the circumstance that enshrouds it; greater than mere things is the spirit that informs the things. Doubtfully the D flat repeats itself; the heart grows stronger in the humanity and kindliness of the dominant passing through G minor; tenderly, gently, yet resolutely, the original key is again in possession; the old burden is taken up once more, bravely, earnestly, unflinchingly; onward to the end, though the path be rough and thorny, though the tender feet bleed, and an unbidden sigh escape from the heart so sorely tried; yet the cross is borne, the crown is in sight, the victory is won!

The last staccato chord fell crisp and clear; then a silence so profound that any word that either could have spoken would have seemed desecration.

A voice that was neither Thornton's nor Renouf's, in quiet, penetrating tones, broke that silence. "How did you know the 'Allegretto'?"

"I do not know; it came to me. It could be no other that I ever heard. But where have you been? When did you come in?"

"Just as you began to play. I heard your last words, guessed you had been wondering and disagreeing over my picture, and was inclined to play eavesdropper to hear your interpretation of 'Allegretto.' Without asking, I know what Renouf's must have been—either Haydn or Mozart."

"I am convinced that my interpretation was wrong, and Thornton's right. It takes a genius to understand a genius; I am only a clever pianist, and can never hope for inspiration or intuitive perceptions."

"You do yourself injustice because you are angry with yourself. I am proud of you both, each with your different gift. Thornton would never bring down a house with applause, as you invariably do when you choose—"

"With wonder and astonishment at my nimble fingers and amazing octaves. I could never hush a room full of apparently careless hearers to utter silence, and bring forbidden tears to their eyes, as Thornton can, when the mood is upon him. I would give half my technique for a tithe of his power of expression."

"You have not suffered enough for that. Indeed, I do not believe you understand the meaning of the word. Were you ever unhappy?"

"Never that I remember. The keenest disappointments of my life have come from my tailor's misfits. Things have gone smoothly ever since I can remember. My profession is my pleasure, not my necessity. Mother and Jennie pet and idolize me to folly. The public, the dear, whimsical public, taking a fancy to my boyish performances, I have been its darling pride ever since. If I want a sensation of pain, I shall be obliged to go to the dentist's."

"Contrast your life with Thornton's. He never knew the meaning of the word home. Without father or mother, brother or sister, or any one in this whole wide world to claim kinship with, he has known cold and hunger, bodily as well as mental suffering. The only enjoyment of his boyhood was creeping stealthily into church behind me when I went there to practice. The loft was dark, full of nooks and corners, where a little half-starved boy of nine could easily hide himself: for months he had done it successfully. One evening I turned suddenly for some music I had forgotten. There the poor child stood. I shall never forget the scared look on the little white face, and piteous 'Please, Sir, don't send me away; I will be very still; it is just heaven and the angels.'"

"And of course he didn't send me away, but took my little cold hand in his, and led me, trembling with awe and delight, into the holy of holies, as it seemed to me. Instead of hiding in the dark, shuddering with fright at every pause lest I should be discovered, I stood in the very Presence, saw the cold white keys at his bidding disclose their secret mysteries. The magic of his touch awoke the warm, rich harmonies that had thrilled my soul in the silent deserted church, peopling the air with a world more real and precious to me than the one in which I lived, bringing forgetfulness of cold and hunger, darkness and solitude. I always date existence from that hour. All that I am to-day, all that ten years have made me, I owe to him—my master and my friend. Ah! it was a God-given vision that led him to see a possible future for the

little ragged newsboy—a divine humanity that has helped him to make of that dream a bright reality."

"Incarnate selfishness, Renouf, the whole of it! You mustn't believe all that boy says of me. I am not an angel of light, as he would have you think, but a poor sinner, especially weak and foolish where you both think me strong. It is a night of confessions, or I should never have said what I did about you, Thornton. I believe I shall feel my burden less if I share it with you in telling it. I am glad you are both here. I might grow morbid and sentimental if I told the tale to Thornton alone; the life drama is tragic enough in its barest statement. If to-night my heart and lips are unsealed, let the remembrance pass with the words I utter."

One tender loving look from Thornton gave assurance of his sympathy and trustworthiness. It was no new thing for Langley to confide in him. To Renouf it was both strange and unexpected. Loving and admiring his master with all the ardor of a great warm heart; full of boyish enthusiasm for the greatest musician he had ever known; accepting his principles and methods in the smallest detail; believing in him to the utmost; following where he led with the devotion and earnestness characteristic of all his disciples—there had always been a sense of distance, a feeling that only musically were there any points of contact between master and pupil. This confidence, so new, so fascinating in its strangeness, touched the young man deeply. A warm pressure of the hand said what spoken words would have failed to express.

"Let me light this fire first and put out some of these lights. I fancy a kind of twilight is the nicest for story-telling."

A bright wood fire was soon blazing merrily, the shadows rose and fell, while the flickering light shone on the three contrasting figures, as different in their physical aspect as in their mental and spiritual constitutions. Renouf, with his six feet of manly strength and beauty, a giant Adonis, with his close curling hair, his bright complexion, and flashing eyes, was the embodiment of physical perfection. Thornton, pale and fragile from want and exposure in his childhood, was pale and fragile still in his early manhood; the large brown eyes were full of liquid, dreamy softness; the dark brown hair, fine and silky as a child's, betrayed the nervous, delicate organization; his playing so thoroughly characteristic, his spirituelle face and at times abstracted manner, impressed one with the preponderance of soul over body.

So much for the pupils. For the master, to say he was the best-loved and the best-hated man in his circle, gives the key to his peculiarities of temperament and constitu-

tion. Hair and complexion of Saxon fairness; blue eyes capable of untold tenderness, or of sternness as cold and chilling as blue steel; fascinating in manner and address, even to his enemies when he chose; with wonderful versatility of talent, limitless imagination, high culture, and unbounded influence over all who fairly came within his sphere, Richard Langley stood as fair a type of the Intellect as the others of Soul and Body. Whether he had also a heart, his own story will perhaps disclose.

"The music and the picture which you were discussing when I came in, my unusual absence, and the saddest and happiest memories of my life, all relate to one who, whether in the body or out of the body, has exercised a subtle, penetrating influence over me for ten years. The best things in my life I owe to her. I am a better man to-day for having loved the pure-hearted, noble woman whose picture bears the name of Allegretto.

"I must return in part to the day, ten years ago, that I found you, Harry, at St. Stephen's, and yet again to an incident that occurred three months earlier. I had called in for a moment at Legarré's about some photographs he was taking from Millais's picture. I found every thing in confusion, preparing for removal. A pile of odd proofs lay on the counter, evidently the accumulation of years. Turning them over carelessly, I was attracted most singularly by one of a young girl, as I first thought; a second look suggested more maturity of thought and feeling, if not of years, than belong to sixteen. Legarré coming in at that moment, I asked about the original. He didn't know, there were so many strangers coming and going; thought, though, he would have remembered such a face if he had taken the negative; must have been done some time when he was away; might have the picture if I fancied it.

"I came back to my room with my treasure, and began to study its peculiarities. I am always fond of tracing hidden meanings in chance expressions, when the mind for a moment is off duty, and the true soul shows through the flimsy veil of the body—useless for keeping secrets unless the will too is *en rapport*. The photograph is a great help to such study. The sun is a faithful limner, and paints just what he sees. If the polished, elegant man of society, the tender shepherd of his flock, looks coarse and brutal in one picture out of a thousand, be sure, when that picture was taken, at that moment, the world, the flesh, and the devil reigned supreme. You are surprised to see an expression of pain and sadness in the picture of one whom you know, and the world knows, bright and joyous, gayest of the gay. You say, 'Tis no likeness; my friend never looked like this.' It is you who are

wrong, the sun never: whether you discover it or not, the pain and the bitterness have somehow crept into that life, with all its seeming happiness.

"Hour after hour I gazed at the fair young face, vainly endeavoring to satisfy myself as to its meaning; forever it eluded me, just when it seemed within my grasp. Haunted incessantly by the thought that in some way I could translate it, it seemed like a poem to be set to music; but there could be but one tone poem that should be its own. Suddenly there flashed across my mind the strange, incomprehensible Allegretto. I felt my way by the fire-light to the piano, and played it through. At last the face and the music made one perfect whole. I can not express to you the sense of entire satisfaction and rest which it gave me. I felt almost sure, too, that some day, somewhere, I should see face to face her who was already the one woman in the world for me.

"Three months passed by. If my fate was coming to me at all, it must be in its own resistless course; the best and truest things in life just happen, and are never had by seeking.

"When I opened my letters the night I left you at Mrs. Moody's, to be cared for till I came again, I found a note from a Mrs. Robert Douglas asking me to call at my earliest convenience that she might consult me with regard to her daughter's lessons. The request was one that could have come only from a stranger, as it was well known I never went out for lessons.

"London Terrace was not at any great distance, however; I had no pressing engagement, and was just a bit curious to see who Mrs. Douglas might be—a woman of energy and decision evidently from her handwriting, the daughter probably a silly school-girl or a stupid child.

"Mrs. Douglas proved to be, as to personal appearance, much such a woman as I imagined—tall and dark, with a great deal of reserved force, indicated in the intensely quiet tones of her voice, the somewhat rigid lines about the mouth, and the occasional flash from a pair of dark eyes that at first had a heavy, sleepy look.

"The usual conventional courtesies having been exchanged, I was about to make some inquiry as to my future pupil, when, slightly raising her voice, Mrs. Douglas said,

"'My daughter Leslie, Mr. Langley.'

"A voice as low and quiet, but far more musical, in a tone almost of remonstrance, answered, 'Mamma!'

"'My daughter, Leslie Douglas, Mr. Langley,' the mother repeated, with a slightly added emphasis.

"Bowing as I acknowledged the introduction, I did not see Miss Douglas's face till she too raised her head from the somewhat

formal courtesy with which she greeted me.

"Was I dreaming? There stood my Allegretto as I have been endeavoring to portray her on the canvas. The photograph gave only light and shade, and I had only guessed at the coloring; the hair a trifle warmer in tone; the eyes gray, I was sure of that; color coming and going, giving alternately the rosy flush of happy girlhood, and the almost pallor of a suffering woman. Was it excitement and embarrassment at meeting an entire stranger so abruptly, or was my study of the picture true also of the woman? Was there a real as well as apparent duality of character whose equipoise was just then disturbed? You know how much self-control I always have, and how impossible it is to read my thoughts in my face.

"We were soon in the midst of a pleasant conversation on musical topics. Miss Leslie informed me that her training had been vocal almost exclusively, that accompaniments troubled her, and she desired to obtain the greatest possible dexterity with her fingers in the shortest possible time. This I readily promised her if she would adhere faithfully to my method. At my request she consented to sing if I would accompany her. Mrs. Douglas made the selections, chiefly florid operatic and concert pieces, a few charming piquant Spanish ballads, all indicating rare natural gifts, with judicious and refined culture. Yet I was conscious of disappointment: this was not the soul I fancied lay hidden behind that placid, calm exterior. Almost at random I opened a volume of Schumann songs that lay on the piano. 'Sing this, if you please,' I said. Ah! shall I ever forget it! The intensity of pain and endurance that expressed itself in the *Dichterliebe*, 'Ich grolle nicht,' and 'Ich will meine Seele tauchen.' That glimpse was enough. My pupil would interest me—of that I was sure—and I readily consented to the unusual proposition to come twice a week in the evening for a lesson.

"It is needless to give in detail the weeks and months as they glided by; unceasing diligence and perseverance on her part, added to great natural ability, had given the execution desired, but I had never tested her with any master-works to interpret. She knew nothing of Beethoven, though she sang 'Adelaide' in a way that must have satisfied Ludwig himself. I left the first volume of the Sonatas with her one evening, bidding her select any movement she chose to play to me the next time. It seems almost incredible, yet I knew I hoped for it in my heart of hearts: when the time came she played the Allegretto as you play it, Thornton, or as I might play it myself, and yet she had never heard it. I dared not say what I felt. With the simple 'Thank you, it is very good,' I gave her a Thalberg fan-

tasia for the next lesson. She learned so quickly, with such avidity and eagerness, as the new world of harmony opened out before her, that I found myself trying experiments with her constantly—experiments which I know now were cruel. I shall never forget the look on her face as she played the Chopin Polonaise in C minor, or when, a few weeks later, I gave her the Sonata Appassionata. Her air at the piano was always one of quiet elegance; her usual expression suggested peace and repose, with such intimations of quiet comfort and enjoyment as a halcyon day in June may give; but when she played her face was transfigured, the light was from within, and she wist not that it shone.

"Gradually the conviction forced itself upon me. I loved Leslie Douglas, knowing nothing more of her or her life than came to me through her music and her strange sweet face with its manifold contradictions. I would tell her, but it should be in a Liebeslied; my fingers should interpret to her rather than my lips.

"Often Mrs. Douglas remained in the room; but fortunately for me the evening when I had resolved to put it to the test, and win or lose it all, we were alone. At the conclusion of the lesson there was a pause.

"'Shall I sing for you?' Leslie said.

"'No; I will play to you,' beginning as I spoke that loveliest Liebeslied of Heusselt's. Had I dared, I would have played Loeschhorn's Liebesglück with Rückert's exquisite words. I felt sure that she would understand me. What would she answer? I hoped she would lay her little white hand in mine and say 'Forever.' Instead of that she moved to take my place at the instrument, and played that saddest of Chopin's nocturnes, with its helpless, hopeless despair, wailing a death knell to all hope and aspiration. Her meaning was as plain and palpable as mine had been, and yet so mad was I with passionate longing that I would not be denied.

"'Leslie, darling Leslie!' I cried. At the sound of my voice her face grew white, her lips quivered; with a trembling hand she motioned me away. When I would have clasped her in my arms she shrank away from me shudderingly.

"'Leslie Douglas, can you not love me?' I said. 'I can wait for the love to grow to the perfect arch, only tell me that hidden in your heart is its secret deep foundation. Speak to me, Leslie! Do you not love me?'

"'I do love you, Richard Langley! Heaven is my witness, I did not dream that you loved me until to-night. I had not courage to put from my lips the one sweet draught life offered me. I felt the pain was only mine, and I could bear it, for the pleasure was ever greater than the pain. You will understand me better—will you forgive me

ever?—when I tell you I am Leslie Douglas: I am also *Mrs. Robert Douglas, and my husband lives!*

"What I said in my wild frenzy I do not know. As my excitement increased she grew calm. She was ever stronger than I. The balance adjusted itself: if I had much to forgive in her deception of reticence, she had far more to forgive in my reckless passionate words, wrung from a tortured heart.

"Before we parted she had told me in a simple straightforward fashion her story.

"At fifteen she had married her adopted mother's only son, a man twice her age, handsome, fascinating, and wicked; the pride of his mother, who was willfully blind to every fault; the object of scorn and detestation to all who knew him well. Two months after the marriage Robert stole from his mother's secretary a large sum of money, with bonds also, which eventually led to his detection. With this came a disclosure of systematic frauds and forgeries on his part, by which her large fortune was reduced more than half, and Leslie's pittance entirely dissipated. With the same unreasoning impetuosity which had ruined her boy through overindulgence, Mrs. Douglas cursed and disowned him, let the law take its course, and took the child-wife home to her heart. They went abroad; spent several years completing her education; every thing money could buy was lavished freely upon her. Robert's name was forbidden. Leslie Douglas was her daughter to all intents and purposes. The law gave her freedom, if she chose to take it. As years went by the elder lady would gladly have taken her into society, but Leslie refused to go as Miss Douglas, and the mother would not listen to any thing else. Her hesitation the night of my introduction was explained, with much else that from time to time had struck me as strange and anomalous in the apparent relation between the two.

"At the time of her marriage Leslie was too young to have entertained any other than a girl's fancy for a handsome lover. With the knowledge of his unworthiness even that passed away, leaving only the wretched, bitter fact that he was still her husband, she still held in bondage.

"Owing all things to his mother, who was also her nearest relative, this young girl, adding the living sacrifice of daily life to the first great sacrifice, grew into womanhood, with all its lovely graces, without any other friendship or companionship. They were united by a common misery as well as by mutual affection, the one expressed freely, the other by tacit agreement ignored as far as possible in daily life.

"The eager craving, the passionate ardor, with which the poor child threw herself into the enchanted realm of music, the rest, the comfort, the ever-renewing source of strength

it was to her, were easy to comprehend. Her very simplicity and want of conventional-ity, to me her greatest charm, had betrayed her into the error so fatal to us both.

"It was impossible that we should meet on the old familiar footing. I dared not trust myself. She knew I was right, and trusted me. Oh, the bitterness of that parting! The iron entered into my very soul. Yet I am a man, and men do not die for love. I live. But Leslie Douglas! Yes, she lives too, but in that land where is neither marrying nor giving in marriage. Her heart was broken that night when mine was turned to stone. The springs of life were snapped asunder; slowly and surely she faded away; with the early violets we laid her to rest, all the calm and sweetness of heaven on her brow and perfect lips.

"A week before she died she sent for me. I was very calm. How could I be otherwise in the presence of that unearthly beauty, that heavenly purity? She had two requests to make—one that I would remain with her till all was over, and comfort her mother, who could not, would not, be resigned; the other to seek Robert Douglas when his term of imprisonment expired, and tell him she forgave him all. There were deeper wrongs than those I have disclosed. 'Oh, Richard Langley!' she said, with all the gathered energy of her heart and soul, 'reconcile Robert and his mother, as you hope to meet me in the great Hereafter!'

"I promised.

"The end was not quite so near as she thought; a few days yet remained. Every hour was given to her. If it could have been a lifetime, instead of a week! At times, with a voice exquisite in its sweetness to the last, she would sing snatches of Schumann and Franz songs, or some quaint German hymn; oftener she lay quietly on the lounge, listening to such music as my breaking heart yet had courage to give.

"It seems strange, does it not? that at the last she could not bear Chopin. There was no hope in it, she said. Beethoven always gave her pleasure; behind the pain was the trust and the triumph; out of momentary weakness came strength; the victory was always sure. An hour before her death she asked for the Allegretto. The look her face wore at its close remained even when the gray coldness of death crept upon it. As she breathed her last, for the first time I held her in my arms, and on her white cold forehead pressed the purest kiss a man's lips ever gave. I said that, in the body or out of the body, her influence ever was upon me. There are times when I know she is nearer to me than even you at this moment, Thornton; there is between our spirits but one fleshly veil. Where she bids me go I go. The best and truest things of my life have been done under her guidance. Not a

spiritualist in the ordinary sense, I am conscious of *her* presence, and acknowledge it as a power in my life.

"Last night every thing was as you see it now. I had been playing the music she loved. I was at work on her picture. Gradually this sense of her nearness crept over me; a voice from without seemed to call, 'Leave all and follow me.' Unhesitatingly I left every thing, following blindly where the voice should lead. In Park Square I met Dr. Anthon.

"The very man I want to see!' he exclaimed. 'Do you know any one named Douglas?' he added. 'I have a fancy that I heard you speak once of a pupil by that name.'

"I had such a pupil,' I replied; and of course asked the reason for his question.

"There's a poor fellow at the hospital,' he said, 'only out of prison three days; he's dying, sure, and much of the time wandering. His registered name is John Brown—fictitious of course; but he mutters constantly about the Douglas, "The Black

Douglas shall not harm you." "Douglas shall have his own," etc. It's only an odd fancy, but I thought of you, and said to myself, who knows? perhaps there is some sad story back of all this, and Langley's the man to know about it. The fellow is a gentleman, of that I'm sure.'

"We reached the hospital. It was Robert Douglas. I can not recount to you the harrowing, heart-rending scene: a wasted life, with the full consciousness of all that might have been borne home to his soul in his body's helplessness and last extremity. I found his mother, and fulfilled Leslie's last request. It was a fearful sight and sound. The reproaches and curses that mother had launched on the head of her son came back with all their sharp bitterness; she would have gladly laid down her life to efface the memory.

"Her boy died in her arms, forgiving and forgiven.

"Thornton, put up the lights! Renouf, play the cat's fugue!"

GALILEO AND THE PAPAL INFALLIBILITY.

THE close of the sixteenth century and the triumphs of the Jesuits gave the final blow to the vigor of the Italian mind. From that inauspicious moment, save one, no powerful and independent thinker, no Milton, Bacon, Newton, Hampden, flourished on the sterile scene of priestly tyranny.¹ For two centuries the voice of free discussion was stilled, the wants and aspirations of the people found no utterance nor defender, or if one ventured to sigh for a new Italy he was shut up in the coils of the Roman Inquisition or banished to the chill regions of the North. The deliverance of Italy from its mental bondage and its spiritual foes has come at last from foreign hands and hostile arms, and the perpetuation of its novel freedom must rest in no slight degree upon the protection of a German lord. Yet it was to Italy that Europe once looked for its own deliverance from feudal tyranny and mental decay. Its prosperous republics, the centres of industry, taught to Germany and England the chief elements of civilization; the poets of Tuscany awakened the European intellect.² But for Dante and Petrarch

there could have been no Shakspeare nor Spenser; and when in its last decline, in the close of the sixteenth century, the poison of priestly tyranny had dissolved all its members, when there was no room for letters and no hope of mental advance, the genius of Italy had already clothed itself in the guise of painters and sculptors, and covered with a cloud of artistic glory a land that was swiftly perishing in the deadly embrace of popes and kings.

The trial and imprisonment of Galileo form the final scene in the death of the Italian intellect.³ The most eminent genius of his country, if not of his age, almost the founder of modern science, the peer and contemporary of Shakspeare, Bacon, Milton, the successor of Michael Angelo, had Galileo obtained an utterance in Italy for scientific truth, the spell that rested upon her might have been broken. There might have bloomed once more a literature touched by the free spirit of Dante, a political progress that would have reflected the Puritanic revolutions of the North. But with Galileo fell the independence of Italian thought. His abjuration is the saddest picture in modern intellectual history. Conscious of the truth, he was condemned to renounce it and repeat a falsehood.⁴ The Newton, the Herschel of

¹ Some compilations, like that of Tiraboschi, a few tolerable poems and novels, Alfieri's tragedies or Manzoni's fictions, have won reputation. Vico and Castelli might have flourished in a land of freedom; in their own they wrote with caution and fear. Yet it is the natural trait of all modern Italian literature that it is the enemy of the papal rule.

² The influence of Galileo on science can scarcely be estimated. The *Sidereus Nuncius* and the *Dialogue* are among the most powerful of modern intellectual agents.

³ Alberi, *Opere Galilei*, 1842, never furnished any life of Galileo. His collection gives a good view of the industry of his subject.

⁴ The *Dublin Review* some years ago advanced the notion that Galileo never believed the Copernican theory. It suggested that Galileo was "one of the most

his age, he was forced to abjure the favorite studies of his life, and pause forever in that path of scientific discovery which had already made Italy famous. All the world witnessed his fall, and he whose eye had first pierced the mysterious vault above, who of all his race had first brought back tidings of new suns and planets in its sublime abyss, yielded to the terrors of torture, the fear of death, and sacrificed the integrity of his soul to the menaces of the church. With malignant joy the Jesuits saw the last great Italian perish within their toils, and were perhaps satisfied with the humiliation of Galileo.

When, at the close of his splendid career, covered with renown yet shut up in his villa at Arcetri, the prisoner of the Inquisition, watched by envious eyes, threatened, should he murmur or rebel, with the most dreadful punishments of the church, Galileo, sick and worn with age and sorrow, lamented in letters to his friends that he had ever ventured upon those fatal studies which had served only to bring upon him persecution and shame, a fair-haired, blue-eyed poet from the cloudy North, who was just entering with an equal ardor upon the search for truth, visited the bright skies of Florence,¹ saw with astonishment the imprisonment of its greatest genius, and heard perhaps from his own lips the unmerited sorrows that had fallen upon his later years. It was Milton lamenting for Galileo. In the cultivated society of Florence the young English scholar must often have remembered the lonely prisoner who, shut out from all the pleasures of intellectual intercourse, was confined in the distant villa. Milton at Florence wrote verses, was complimented in graceful stanzas, and was not slow to return the elegant adulation. Yet with all the more intelligent Florentines he saw typified in the fate of Galileo the quick extinction of Italian letters. In his defense of the freedom of the press he relates to the English public how a severe Inquisition had checked at Florence all mental progress, how the accomplished Florentines lamented that they had not been born in a land like England, where learning was free, how nothing was now written in Italy but "flattery and fustian." "There," he adds, "it was that I found and visited the famous Galileo, grown old, a prisoner to the Inquisition." The spectacle of the great philosopher, silenced, terrified, condemned, never passed from his mind. In his youth he had lamented over him tenderly. In

manhood, when a mental tyranny like that which hung over Italy seemed about to envelop all England, and a persecuting church and a despotic king had nearly subdued its virtue, Milton, instructed by the fate of Italian thought, led on the defenders of freedom. And when in his old age, blind and forsaken like Galileo, he poured forth in sonorous strains the treasures of a life of study, one of his most splendid similes, one of his most touching allusions, is when he paints the Tuscan artist on the height of Fiesole, and makes the chief glory of science lend aid to the immortal grandeur of his song.¹

Galileo was born in poverty at Florence in 1564, the year of Michael Angelo's death and of Shakspeare's birth. His father was a teacher and composer of music, and the young Florentine, nurtured in privation and designed for a trade, seemed little likely to become the source of all modern scientific progress, or the chief foe and victim of the ruling church. But his clear and subtle intellect soon disclosed itself, and his father, with painful sacrifices, contrived to give him a liberal education. He taught him early to play upon the organ and the lute, and Galileo became an accomplished musician. Like Milton, he loved the concord of sweet sounds, and in his old age, blind and sorrowful, would still soothe his melancholy by playing upon his favorite lute.² He excelled in painting, and was a careful student of poetry. He acquired readily Latin and Greek, so active was his intellect, and in his seventeenth year went to study medicine at Pisa. It was hoped that in the practice of a liberal profession he might rise from that poverty in which his father had ever hopelessly lingered. But at Pisa his passion for mathematics and his bold and fertile resources in mechanics soon became evident. He taught himself geometry. He discovered the principle of the pendulum from the vibrations of the great bronze lamp in the cathedral. He began to invent scientific instruments. His novel speculations in philosophy and his bold defiance of the authority of Aristotle offended the Pisan professors, and involved him in a lasting controversy. Soon he began to question nature herself, and strove to penetrate into the unseen principles of matter. He practiced in Italy what Bacon was teaching in England, and even in his early youth startled the minds of his contemporaries by his command over the secrets of the

mendacious and cowardly poltroons who ever appeared in public life" if he did so and denied it or recanted. Probably the Catholic writer had never been threatened with torture by an infallible pope capable of any cruel deed.

¹ Milton, *Areopagitica*. Johnson thinks Milton lost some attentions in Italy by venturing to visit Galileo. It was a dangerous act of homage.

¹ Milton seems to have doubted the new wonders. It was of "imagined lands and regions in the moon" that he last wrote. But of Galileo's greatness he never doubted.

² Viviani, a devoted disciple, wrote his *Life of Galileo* in 1664 to please Rome and the papal rulers. He wrote under the eye of the Inquisition at Florence. Of modern lives there is a limitless number. A good account of his scientific connection with Copernicus may be found in the *Fortschritte der Naturwissenschaft*.

universe. The church frowned upon him; the university reprobated his novelties; but in the midst of a general hostility he won friends and fame. He was celebrated by his admirers as the first mathematician of Italy, if not of Europe. He was already called the new Archimedes when, in his twenty-seventh year, amidst the opposition of nearly all his colleagues, he was named Professor of Mathematics at Pisa.

It is related that amidst his physical researches he lectured with great applause on Dante, and that as critic or author he might have adorned and enlarged the literature of Italy. So varied an intellect has seldom visited the earth. In almost all the branches of human learning Galileo attained excellence, and in all mental exercises outstripped his contemporaries.¹ His mind was a delicate yet powerful instrument that might be applied to any kind of mental labor with unlimited success. His clear perceptions, his ceaseless industry, seemed never to lose their reward. In pure literature he attained a style so perfect and so simple as to rival the austere graces of Pascal, and to which the harsh obscurity of Bacon or the severe grandeur of Milton's prose seems almost barbarous and rude. He could mould the soft and flowing Tuscan into the most delicate forms of irony, or present in the clearest diction all the novelties of truth. But at Pisa his bold and aggressive researches and arguments, his firm adherence to his own convictions, increased the number and virulence of his foes. He was forced to resign his professorship, was driven from Florence, which he loved with the ardor of a true Florentine, and was at last made mathematical professor at Padua, under the protection of the Venetian senate.

Fame, wealth, and honors seemed now to descend upon Galileo in a profuse abundance that might well have satisfied the simple wants of the man of science. At Venice, of all the Italian states, the papal church had least influence. Fra Paolo, its bitter satirist, had escaped its malice, and survived the daggers of its assassins; and had Galileo never left the safe shelter of his Venetian friends, he might have avoided the pains of his later years. But at Padua he was received with singular respect. His lectures were thronged by eminent disciples.² Princes and nobles came from all

parts of Europe to study under the gifted Italian, and men more eminent than princes and nobles were the sharers of his enthusiasm for truth. Graceful, well-formed, tall, with bright eyes, and hair inclining to red, with pleasing countenance, a cheerful aspect, polished in his manners, and gifted with a classic purity of expression, Galileo's lectures aroused an ardor for investigation that none of his contemporaries could equal. His pupils and his friends pursued him with unceasing devotion. "I thank God," said one of them, "for having given me for a master the greatest man the world has ever seen." "When," wrote another to him, in his sad old age—"when shall I embrace you as a father, and listen to you as an oracle?" His house was filled with devoted students. The noblest and the most learned men and women of Venice and of Florence gathered around him. He was already at the height of a deserved renown when, by a rare discovery, he startled all Europe into attention, and proclaimed, in the *Sidereus Nuncius*, that he had a message from the stars.³

Of all his varied gifts, Galileo has produced the most important influence upon modern progress by his mechanical dexterity and his inventive force. His busy and dextrous touch moulded the rarest instruments and the most complicated machines. His house at Padua was a workshop, where a ceaseless round of invention and of mechanical improvements went on, where laborious days and nights were given to the advance of those practical arts that most affect the physical welfare of man. He was the prince of mechanics, almost the parent of modern invention.⁴ There is scarcely a branch of mechanical labor that has not felt the influence of his practical skill, nor a modern inventor that has not owed something to his creative power. Of the vast network of machinery that sustains the fabric of modern civilization there is no part that has not its trace of the labors of Galileo. He invented, improved, or embellished the barometer and thermometer, the pendulum and the magnet, hydraulic and military machines, the compass, the telescope, and the microscope. A throng of less renowned instruments and engines, prepared by his delicate touch and unprecedented skill, flowed from his workshop. His treatises on mechanics, fortification, and the laws of motion excited the emulation of Europe; and it was by his rare accomplishments as a practical mechanic that he was enabled to create that

¹ M. Martin, Gallée, etc., 1868, Paris, gives a not unfair account of his theme. Henri l'Épinois, Gallée, son Procès, etc., Paris, 1867, furnishes extracts from the process of the trial, which was long lost, but which appears to have been recently restored at Rome. Parchappe de Vinay, Paris, 1866, Gallée, has painted his story with fresh vigor. The literature of the subject is multiplying; and Wohwill, Der Inquisition-Process des Galileo, Berlin, 1870, promises a new life and new theories.

² An interesting and careful view of the inner history of Galileo and his family, from the letters of his

daughter, Sister Maria Celeste, throws new light on his character. See *Private Life of Galileo*, London, 1870.

³ *Sidereus Nuncius*, Venetiis, 1610. The illustrations of the *Nuncius* were so fine and so new as might well startle the public attention.

⁴ Parchappe, Gallée, p. 45, enumerates his inventions. Galileo never concealed his indebtedness to others.

wonderful instrument whose revelations have founded a new science, and penetrated the starry heavens.

In the year 1609, Galileo relates, he first heard from a friend in Flanders that an instrument had been invented by which distant objects were brought near and the powers of vision extended.¹ He resolved at once to imitate and surpass it. By his singular mechanical dexterity, his knowledge of optics, and his highly polished glasses, he was soon able to produce a telescope before which the Dutch instrument sank into neglect, and was forgotten. It was never more heard of; but a thrill of wonder passed over Italy and Europe when it was known that the famous Paduan professor had prepared an optic glass that enlarged the bounds of vision and endowed mankind with new powers. The charm of surpassing novelty covered the wonderful invention with an unprecedented renown. The great and the learned contended for the possession of the new instrument. Galileo carried his telescope to Venice, and from the tallest bell-towers senators and nobles saw through the magic glass great argosies sailing far out at sea, and the distant shores brought near and made visible. All the value of the new instrument broke at once upon their minds: it must change the principles of military strategy, and diminish the perils of navigation. Magistrates, senators, and citizens covered the fortunate inventor with applause. With discreet courtesy, Galileo presented his telescope to the doge² at a friendly audience, and the Venetians at once raised his salary to a thousand florins. Covered with honors and emoluments, he returned to Padua, little conscious of the surpassing discoveries that yet awaited him in the silent heavens, or of the pains and woes he was destined to bear in his later years from the heretical revelations of his too truthful and fatal telescope.

In all the years in which mankind had surveyed and studied the glittering heavens above them no one had been able to add to the number of the stars, or to define the nature of moon and planets. Philosophers of Memphis and of Pekin had failed equally to construct a tolerable theory of the heavens.³ The shining orbs had seemed so brilliant and ethereal, so far removed from the coarser elements of earth, as to form a throng of bodies

altogether celestial in their nature, free from the grosser elements with which man was familiar. From the fertile fancies of Greek poets and thinkers had descended the notion that the sun and all the hosts of the night swam in a glassy ether, circled around a motionless earth, and were designed alone to light the paths of men. The Scriptures had not increased the sum of astronomical knowledge. Joshua had commanded the sun to stand still, or Job surveyed the sweet influence of the Pleiades, and David sang of the majesty of the starry heavens. But the Greek, or perhaps the Phenician, theory, maintained by Ptolemy and the Aristotelians, had at length gained universal prevalence. The Roman Church adopted it. Infallible popes and councils had held that the sun moved round the earth, that the stars and planets were of an incorporeal if not spiritual nature, and that the immutable ether above was studded with a host of gracious wanderers, whose chief aim was to watch over the destiny of men. Astrology had still further enlarged the conception. In the age of Galileo every eminent prince or statesman read his destiny in the stars. The pupil of the Jesuit, Wallenstein, and the Protestant Gustavus Adolphus had their horoscopes calculated by cultivated astronomers. Even Galileo practiced and smiled at the popular superstition. The priests confided more firmly in the decrees of astrology than in those of the church; and when Copernicus, in the sixteenth century, suggested that the sun was immovable, and that the planets and the earth were bodies governed by common laws, and circling around a common centre, the theory was pronounced heretical by papists and Protestants, and seemed only an extravagant vision, the growth of a disordered fancy. Galileo himself doubtless disdained the improbable speculation, and the white path of the Milky Way and the golden wreaths of the constellations were no better understood by the contemporaries of Shakspeare and Spenser, Erasmus and Luther, than they had been three thousand years before, when Chaldean shepherds had studied them on the Babylonian plains.

On a memorable evening in the year 1609, Galileo, indifferently and with no unusual expectation, had turned his telescope upward to the skies. He beheld a spectacle upon which mortal eyes had never rested before. Entranced by the prodigy, startled by the greatness of his discoveries, he saw the moon, whose silver face had beamed for ages unchanged in the dying generations of man, resolve herself into a wild waste of mountains and deep ravines, "imagined lands and regions yet unknown."⁴ The

¹ Sidereus Nuncius, 1610, Francofurt. He admits distinctly his indebtedness to the Dutch suggestion. *Fuisse quodam Belgæ perspicillum elaboratum*, etc. He raised the power of the telescope a thousandfold, p. 9.

² Galileo to Landucci, August, 1609; to Buonarrotti, December, 1609.

³ Fortschritte der Naturwissenschaft. Some Pythagoreans had taught the motion of the earth, but not the Copernican—possibly even a truer one—that the universe moved around a central fire (p. 5), by 1530. Copernicus had excited the wonder of Europe by his theory, p. 24. *Bereits im Jahre 1530 hatte Copernicus seine Lehre im wesentlichen abgeschlossen*, etc.

⁴ He relates his discovery with calmness; is full of gratitude to God. "I have already ascertained," he says, "that the moon is a body similar to the earth." *To Vinta*, January, 1610.

mystery of ages was revealed in an instant. It was plain that the celestial satellite was no incorporeal substance, but possessed all the material attributes of the earth. A succession of prodigies followed. The pale course of the Milky Way was dissolved into hosts of stars. The astronomer could boast that he added millions to the numbers of the known heavenly bodies. When he turned his glass to Jupiter, four lesser stars appeared attending the planet. Sometimes they were all visible on one side, sometimes one or more disappeared. They were evidently lesser planets following, like the moon, the motion of the larger orb.¹ He pursued his studies, touched by the divine curiosity. Saturn revealed its broad rings; the hosts of stars gave up their secrets; the mystery of the universe was unfolded; and the telescope proved by a resistless argument that the Copernican theory was true.² Galileo hastened to publish his discoveries. He printed his *Nuncius Sidereus* (his message from the skies) in 1610. It contained drawings of the chief celestial appearances, of the four satellites of Jupiter, and related in a brief treatise the wonders of the new heavens.

The Europe for which Galileo wrote, and whose political and religious condition was to have no slight influence upon his future fate, was now in the dawn of a new progress. Of the great kingdoms and states which then appeared so grand and important, but now so feeble and obscure, all were racked and wasted by incessant warfare and by theological disputes. England, with a population smaller than that of several of our American States, under the rule of the feeble James I., was cherishing in its breast the principles of reform, and preparing for a fierce internal contest. In the new republic of Holland, just rescued from the hands of the savage inquisitors, to become the asylum of exiled Huguenots, Italians, and Jews, a mental energy had been developed that was to save England and America from intellectual decay. France, under a degenerate rule, was still animated by the fading elements of Huguenot honesty. Spain lay worn and bleeding in the hands of priests and inquisitors. But it was in Germany that the chief interest of the period was to centre. In Germany the Jesuits were laboring with all the strength of their

early fanaticism to destroy Protestantism in the home of its founders. For their schools and colleges they claimed the possession of all learning and of all scientific progress. They essayed to rule the European intellect, and to engross in their ambitious order the genius of the age, and they hoped to crush the spirit of Puritanism and of reform by the subtleties of a rigorous intellectual culture and the control of popular education. It was for the mastery of Europe that the powerful society was toiling; to extend anew the sway of the Papal Church over the regions that had revolted from its cruel rule; to plant anew the Roman Inquisition in the capitals of Saxony and Brandenburg, and to force mankind back to a servile obedience to the tenets of Rome. Not the shadow of dissent could be tolerated. Whoever ventured to breathe a hint of heresy was to be mercilessly destroyed; whoever opposed his predominant fame and influence to the interests of the triumphant order was to be racked, tortured, and humiliated before the eyes of all mankind. To the conquest of divided and torpid Germany the papal rulers were summoning all their powers, and to subdue Germany they must first insure the intellectual ruin of every Italian state.

Meanwhile all Europe had received with amazement, and sometimes with incredulity, Galileo's message from above.¹ Telescopes were eagerly sought for by nobles and princes, and Maria de' Medici went down on her knees before the astonished Italians to look through the wonderful instrument at the moon. Henry IV. of France sent to beg the discoverer to call the next beautiful star he might encounter by his own name. The Duke of Bavaria, the Elector of Cologne, and Cardinal Del Monte begged Galileo for telescopes. In Florence every one was anxious to obtain a Venetian glass. To please the grand duke, Galileo called the satellites of Jupiter the Medicean stars. The *Sidereus Nuncius* ran through two editions within two months. Galileo manufactured one hundred telescopes, and presented one to each of the sovereigns of France, Poland, Austria, and Spain. To the Grand Duke of Tuscany he gave the first he had made, the source of all his discoveries, and with the passionate longing of a Florentine for his native city, suggested that he was willing to return to the land from which he had once been expelled by the clamor of his foes. He was easily gratified. Eager to attract to his dominions the most famous man of his age, Duke Cosmo settled upon Galileo an income of one thousand florins, with no duties to

¹ Sid. Nunc., p. 17, gives a representation of the satellites. Die itaque Januarii instantis anni 1610 hora sequentis noctis prima cum coelestia sydera per perspicillum spectarem, Jupiter sese obviam fecit.

² Fortschritte der Naturwissenschaft, Erstes Heft, Nicolaus Copernicus, p. 67, notices that Copernicus's theory was no vain fancy; that he had already established the position of the planets: die Stellung der Gestirne zu einander bestimmt. Also Copernicus, folgendermassen: zunächst um die Sonne läuft Merkur, etc. The discoveries of Galileo proved what others had suspected.

¹ Parchappe, Galilée, 60, Sid. Nunc. The number of the discoveries was the chief marvel. Est enim Galaxa nihil aliud quam innumerarum stellarum congeries, said Galileo. The color—lacteus ille candor—he found every where. He pointed to millions of new stars besides his wandering planets.

perform. He was to labor only for his country, and enlarge the bounds of human knowledge. Yet it was with some misgivings that he left the generous shelter of the Venetian senate, the friendship of the learned and eccentric Sagredo, the society of all its cultivated men and women, to enter a city where his enemies were already denouncing and decrying him, and which had not sufficient courage to defend its most eminent citizen in the moment of his peril against the envious malice of Rome.¹

As yet, however, the ruling church had not imagined danger in the startling discoveries. The philosopher was provided with lodgings in the ducal palaces. Florence covered him with applause. He went up to Rome, and displayed to pope, cardinals, and nobles the surpassing wonders of the skies. Cardinal Barberino, afterward his most bitter foe as Pope Urban VIII., solicited his friendship in laudatory verses. Of all Italians Galileo was the most famous, the most modest and laborious, and with a real satisfaction, the purest and most perfect he was ever to know, he returned to Pisa, and with new energy gave himself to his mechanical labors and to a careful study of the skies.² To his ever active intellect, that seems to have shrunk instinctively from indolent repose, the whole universe afforded an endless scene of novelty and delight. "I make new discoveries every day," he exclaims in one of his letters; and it is doubtful if to any single mind so many rare and valuable truths have been unfolded, or whether Galileo has not surpassed all his species in the swift impulse he has given to the study of nature. Like some fortunate discoverer who had suddenly landed in a realm covered with gems and gold, who first surveys new lands and unknown regions, all that Galileo saw was novel, and he was the most fortunate of men of science partly because he was the first. He notices the spots on the sun, the rings of Saturn, the librations of the moon. He gives incessant labor to the improvement of the compass, thermometer, barometer. His mind watched incessantly the discoveries and inventions of all civilized lands, and made them its own. His health gave way under his incessant activity, and his strong and well-knit frame showed early traces of dangerous and destructive disease. Yet in the height of his prosperity Galileo almost disdained the warnings of feeble nature, and while racked with pain or flushed with fever, composed his most polished treatises and constructed his most delicate machines.

Enemies had already risen up around him. He was assailed by bitter calumny and

ceaseless criticism. At first his discoveries were pronounced false and groundless. He was held up to the world as a Munchausen or a Polo. The Jesuit head of the Roman College, Clavic, ridiculed the discovery of the satellites of Jupiter, and denied their existence. When their existence could no longer be doubted, the Jesuits laid claim to some of Galileo's discoveries as their own. At last he offended the Jesuit Grassi, and gained the ill-will of the whole Roman College. The hostility of the powerful order he seems to have treated with too great indifference, and, lost in his eager search for truth, forgot the perils that beset him. Yet rage, acrimony, intense hatred, and ceaseless envy seemed to spring up about his path with growing strength, and it was chiefly in Italy that his critics multiplied and men were found base enough to strive to convict the chief ornament of their country of falsehood and unbounded plagiarisms. But a more serious charge was soon to be brought against him. He might have borrowed or plagiarized, deceived and deluded, with no fear of personal danger, and no worse punishment than the consciousness of his error.¹ It is indeed plain that Galileo's love for truth was not always apparent in his conversation or his letters, that he sometimes hid his real opinions in a cloud of unsubstantial verbiage, and that he conformed to the customs of corrupt courts and of his Machiavelian age. On one point, however, his passion for truth had overmastered his prudence. Without consulting the decisions of the church, and apparently careless of its authority, he had become an open advocate of the Copernican theory that the earth moved around the sun. The revelations of the telescope had forced him to believe that the skies were no glassy ether, nor the planets mere shining lights in its broad expanse. He seems to have conveyed his opinion to his scholars, though he was accustomed to deny it. All Florence resounded with the new theory. Galileo explained it to the grand duke and duchess, who heard him with apparent favor. His favorite scholar, Castelli, now mathematical professor at Pisa, defended the theory at the ducal palace with no less openness; and in an unlucky moment Galileo wrote a letter to Castelli, in which he showed, with his usual graceful clearness, that the theory was not opposed to the Scriptures, that the Scriptures were never designed to decide any doubtful question of science.²

In Florence the controversy raged on all sides whether the earth was in motion cir-

¹ Martin, *Galilée*, p. 23. The senator Sagredo especially opposed his leaving Venice.

² *Private Life of Galileo*, p. 62.

¹ It is clear that Galileo did not always adhere to the truth where danger was involved. He certainly defended the Copernican theory, and was known as the head of a sect who taught it; yet he was accustomed to deny it. See his letter to Duchess Christina.

² *Private Life*, p. 74.

oling around the sun, or whether the celestial orbs above must still be looked upon as things brighter and fairer than the material world below. All the followers of Galileo pressed with ardor the opinions which he had only faintly avowed, and all the intelligent and cultivated were on his side. In the midst of the intellectual excitement, Caccini, a Dominican monk, eager for notoriety, preached from the text, "Ye men of Galilee, why stand ye gazing up into heaven?" The Dominican, with fierce bigotry, denounced all mathematicians as heretics, all mathematics as the teaching of Satan.¹ A Jesuit defended Galileo from another pulpit. The "sect" of the Galileans were assailed by ignorant monks as the enemies of the church, by inquisitors and prelates as something alarming and portentous. To admit the spread of the new doctrine they felt must shake the foundations of the received theology. The famous letter of Galileo fell into their hands, and with fresh horror they found that he had not only discovered a new heavens, but was prepared to lay down rules for the interpretation of the Scriptures. The cry of heresy resounded from monastery to cathedral. Galileo, in his native city, was looked upon by all bigoted churchmen as the chief of heretics, the enemy of all true Catholics, a rebel against the decisions of the church. Ignorance was terrified at the novelty of his theories, superstition at his impious boldness. The splendor of his fame or the greatness of his genius only added to the terror he inspired, and to his dull assailants he seemed some dark and fallen spirit plotting the eternal ruin of mankind.

From Florence the news of this dangerous heresy was carried to Rome, and a complaint was laid before the chief inquisitors; the fatal letter was produced, and in 1616 Galileo, whether summoned by some secret process, or conscious that he must meet his enemies in the Holy City and defend himself from an imminent peril, went boldly to the home of the Inquisition. He came armed with the splendor of his renown, the friend of kings and princes, protected by the Florentine court, and was lodged in royal palaces. Among the cardinals he had several warm friends, and he was conscious of the support of all the learned and wise in every land. At his first arrival, therefore, he seems to have defended the Copernican theory with imprudent boldness, and defied his enemies to convict him of disloyalty to the church. He professed himself a devoted Catholic, but he ardently asserted that the sun was motionless, and that the earth was its attendant and satellite; that the Scriptures were not hostile to his novel speculations. He

was even sanguine at first that he could convert his opponents by irresistible arguments, and bring over the Roman College and the papal court to the side of scientific truth. But miserable was his disappointment. A pope, Paul V., ruled over the church, to whose dull and feeble intellect every form of mental excellence seemed dangerous, and to whom men of genius and the most profound philosophers were objects of aversion and alarm. The Congregation of the Inquisition, keenly watching for every trace of heresy, were ever ready to obey the inculcations of their master, and punish with extreme rigor the first germs of disobedience. It was not many years since the accomplished Bruno had perished in their hands, and the fate of De Dominis might warn the heretic of his inevitable doom. With a suddenness not easily explicable, Galileo, the chief of philosophers, found his theory condemned by the congregation as heretical. The infallible church decided that the sun moved around the earth. The Inquisition ordered him, under pain of imprisonment within its fatal cells, to abandon his opinion forever. He was never more to teach or to defend the dangerous doctrine.¹ Cardinal Bellarmine, famous for a keen assault upon heresy, Lutheranism, and reform, was commissioned to admonish him of his error, to exact from him a promise of implicit obedience; and Galileo, on a sad and shameful day, in the presence of the famous cardinal and the officials of the Inquisition,² in the name of the pope and the Papal Church, was commanded to believe that the Copernican theory was unfounded, and, under fear of death or torture, consented to a falsehood.³ A work written by a monk in favor of the doctrine was condemned at the same time. The infallible church decided that never again could any true member of its communion assert that the earth moved or the sun stood still, and the Inquisition threatened its severest punishment to any one who should disobey the immutable decision.

From that moment a cloud of mortification and shame rested upon the great philosopher. He returned to Florence no longer elated by the ardor of scientific curiosity, or glowing with the zeal of a passionate reverence for truth. He must have felt, with a fierce indignation which he feared to discover, a sense of injury he was never to confess. He was forced to hide the contempt he conceived for his opponents under a veil of painful humili-

¹ Wohll, *Der Inquisitions-Process*, p. 8.

² The pope gives the order. Sanctissimus ordinavit Ill. D. Cardinali Bellarmino ut vocet coram se dictum Galileum, eumque moneat ad deserendam dictam opinionem.

³ If Galileo refused to obey, he was to be sent to prison. Si vero non acquieverit, carceretur. So Bellarmine monuit de errore supradictæ opinionis—of the earth's motion, and commands him never more to hold or teach it in any manner.

¹ *Private Life*, p. 77. *Parchappe*, p. 17. Galilée était réellement et gravement menacé à Florence et à Rome.

ty.¹ Under the exultation and the scorn of monks and inquisitors, he wandered amidst the throngs of his native city conscious that he had lost his integrity in yielding to the terrors of the church. His friends strove to soften his mortification. The Grand Duke Cosmo was still kind and attentive. Even Cardinal Bellarmine, willing to silence the malice of his foes, published a declaration that Galileo had never abjured or been subjected to any penance, and, with a remarkable variance from the truth, asserted that nothing more had been done than to proclaim to him the decision of the pope against the Copernican theory. Yet it is plain that from the year 1616 Galileo was never free from the ceaseless vigilance of the Inquisition; that he was looked upon as a dangerous heretic; and that in solitude and secrecy he was still meditating upon that matchless theory of the heavens which, in spite of the rage of the church and the menaces of the Jesuits, was to become at last the foundation of modern astronomy, which was to excite the kindred genius of a Newton and a Herschel, and reveal the secrets of the skies. Armed with the telescope which Galileo created, guided by the principles he perished in defending, the modern astronomer weighs suns and planets, and detects the motion of the universe.

In his private life, by his own errors, Galileo had left himself little real happiness; by the misfortunes or misconduct of his relations he seems never to have been free from care.² Large as had been the profits of his scientific labors, they were soon exhausted in adding to his mother's comfort, providing dowries for his sisters, maintaining a thriftless brother and his family, and in unceasing acts of generosity. He often embarrassed himself with debts to aid his helpless relatives, and was sometimes threatened with the penalties of the law when he was unable to discharge their liabilities. Never was there a kinder son, a more faithful and tender brother. But it was in a more delicate relation that Galileo seems to have been less worthy of esteem. He never married, but in the height of his fame had formed a connection with a Venetian woman of inferior rank, by whom he had three children.³ The mother, with his consent, married a servant or retainer of a wealthy family, and both shared afterward in Galileo's liberality. His son, Vincenzo, whom he legitimated, proved worthless and ungrateful; his selfish extravagance wasted Galileo's resources, and added to the unhappiness of his later years. Two daughters, whose filial attentions might have

solaced the cares of his lonely home, he had condemned, with inexcusable severity, when scarcely more than children, to enter a Franciscan convent at Florence, and of all convents the Franciscan were the most miserable and unhappy. The rigid vow of poverty was enforced upon them with unsparing harshness. Perishing with cold, often in want of proper food, sleeping in cells that scarcely sheltered them from the weather, broken by ceaseless illness, exposed to the frivolity of corrupt confessors, and cut off from the protection of those they loved, abandoned by their pitiless relations, and living upon casual charity or their own poor labors, the nuns of the melancholy household often ended their lives in raging madness, or sank under their privations into an early tomb. Such was the lot that Galileo, perhaps ignorantly, had selected for his daughters. Yet when their irrevocable vows had been uttered, he seems at least to have striven to soften their privations. The convent shared in his benefactions, and he was never weary of sending his imprisoned daughters money, clothes, food, and tidings of his own joys and sorrows. The mother superior applied to him for aid in all moments of difficulty. The nuns borrowed a few crowns from him in their deepest distress. He even mended the convent clock, which had defied the skill of Florentine watch-makers, and provided paper panes to cover his daughter's window when the cold winter blasts penetrated her cheerless cell.

The pure and generous spirit of Sister Maria Celeste, Galileo's eldest daughter,⁴ so touched by a rational piety, so full of love for her famous and erring father, an intellect so clear and calm, a disposition so wholly unselfish, gleams out from the Franciscan convent, the usual abode of envy, remorse, and discontent, like an angelic apparition; and with tender self-denial the faithful nun, in the midst of constant illness, endless toils as nurse and attendant, laboring often nearly all night with her needle, regular in her devotions, shivering with cold in the thin garb of her order in April, or sinking beneath the heat of the Florentine summer, became each year more than ever the sole support of Galileo's fading age, his only guide, comforter, and friend. Her mind resembled her father's in its clearness of perception, surpassed it in the conception of moral purity. A correspondence grew up between Galileo and his child, of which all his letters have been lost or purposely destroyed; but those of his daughter, recently published, indicate the tender affection that linked them together. When princes were faithless or the Inquisition frowned, Sister Maria Celeste wrote to

¹ All Galileo's letters are written with natural caution, for imprisonment and torture hung over him; yet more than once he could not avoid breathing out the intense indignation he felt.

² Martin, *Galilée*, 95.

³ Martin, p. 25, 94. *Private Life*, 101.

⁴ *Private Life*. The whole correspondence of his daughter shows her remarkable good sense and intelligence.

Galileo such consolation as only a spotless intellect could give, watched over the family of her untrustworthy brother, mended with nimble fingers her father's or Vincenzo's linen; or when the plague raged over Florence, and the lonely convent trembled at the scene of death around it, was always cheerful, and concealed her terrors that she might soothe those of others. "I look upon you as my patron saint," she wrote to Galileo "(to speak according to our custom here), to whom I tell all my joys and sorrows." She begs Galileo to send her a new counterpane, as she had given away her own, or prepares for him two pots of electuary as a preservative from the plague. But it was the daughter who was now the guardian saint, and the great philosopher had no one to watch over him in his later years but the faithful spirit of his child.

There had come, meantime, in the history of Europe a period when the powers of evil were contending anew with the powers of light, and when the former, it seemed, had won a disastrous triumph. The home of Luther and the Reformation had at last fallen before the papal forces; the plots of the Jesuits against the independence of Germany had been singularly successful. In the midst of a desolate and half-deserted land, amidst the ashes of blazing cities and villages, a scene of human woe such as might have contented the barbarous spirit of Loyola,¹ a weary waste that stretched from the Danube to the Baltic, Protestantism had fallen before the arms of Wallenstein and Tilly, and the court of Rome had apparently resumed its rule over the blood-stained land. With frantic joy Italians, Spaniards, and Irish volunteers rushed to the sack of heretical Germany. With a vengeful rage that knew no satiety the court of Rome, the inquisitors, and the Jesuits triumphed in the miseries of the land of Luther, and saw cowering before them the free cities and states that had once rung with the daring tidings of a new era of progress. Augsburg had fallen into the hands of the inquisitors; Magdeburg was soon to lie a smouldering waste; Prague and Vienna had been purged of every trace of heresy; the standard of Wallenstein had waved upon the Baltic; Rome menaced the fallen cities of Germany with new severities, and Italy lay hushed and hopeless before the spiritual tyrants of the papal court. It was no happy time to suggest speculations in Italian cities that might savor of heresy, or to call down the rage of the Holy Office by philosophical discussions which it had declared impious and forbidden. Yet amidst all the triumphs of the party of reaction in Germany, France, or

England, while Wallenstein was ravaging Bohemia, and Laud persecuting in London, the active intellect of Galileo was ceaselessly meditating upon his theory of the heavens, and with fatal resolution, amidst a round of scientific toil, drew together the materials of his *Dialogue* on the celestial machinery.

The clearest and perhaps most perfect of all modern styles, the most delicate and unobtrusive irony, a varied and almost limitless profusion of scientific learning, a careful and ingenious effort to veil his real opinions in a pretended refutation, have made Galileo's treatise one of the most curious of the productions of the human intellect. In the dialogue between Sagredo, Salviati, and Simplicio the latter is made to triumph over his opponents by a series of arguments that sometimes excite a smile, and sometimes a sentiment of indignation. The pope, inquisitors, and their mouth-piece speak in a tone of authority. The humble Salviati confesses at the close of the piece that all his reasoning is futile;² that his theory of the stars is only a vain speculation; that the learning and wisdom of his opponents have humbled and refuted him. Every page of the singular treatise indicates the mental pressure under which it was written. It is the instinctive labor of a daring intellect toiling in search of truth, yet so trammelled and confined by the terrors of a spiritual tyranny as to shrink hopelessly from the perils of announcing it.³ When he ventures to sneer at the *pusillanimitas vulgare*, the timidity that refuses to admit any new ideas,⁴ when he discusses the tides and the winds, the magnets which to common minds had seemed a vain delusion, the satellites of Jupiter or the clouded face of the moon, one might readily conceive with what energy and splendor of illustration he would have written, with what a rare capacity for scientific deduction, with what authoritative grandeur, in a language as polished as that of Plato, with the full preparation of Aristotle, had he dared like Humboldt to expatiate freely over the universe, or test with Newton the principles of nature.⁵

But for Galileo's shorn and crippled intellect no such happy liberty was ever to be won. The Jesuits and the Inquisition had bound him in a mental servitude. He had

¹ *Systema Cosmicum*, Elzevir ed., p. 457. Salviatus calls his theory Vanissima Chimera; compliments Sagredo on his attention; to Simplicio he apologizes for his persistence in defending a wild delusion.

² In the first edition, p. 458, Salviati breaks out into a burst of admiration. *Mirabile e veramente angelica dottrina, alla quale molto concordatamente risponde quell'altra, pur divina, etc.*

³ *Systema Cosmicum*, Elzevir ed., p. 393. *Sed etiam ad aures admittere nolint, nedum ut examinare sustineant, quamcumque novam propositionem aut problema.*

⁴ The *Dialogue* embraces all the scientific facts recently discovered. He adduces Gilbert's recent treatise on magnetism as one that had been held imo pro solenni stultitia, p. 398. He discusses the tides, 487.

⁵ The frightful effects of the Thirty Years' War may be found in Schiller's history and tragedies. They will be told anew by an American scholar and historian, with fresh research and minute details.

written his fatal book hoping to evade his chains by a humble submission, and now that it was finished, must obtain permission to publish it from the inquisitors of Florence and of Rome. That he should have desired to publish it at all is a trait of scientific blindness or of rash ambition that can scarcely accord with his usual prudence. A man of the world and of courts, accustomed to Italian intrigue and Machiavelian politics, he yet, on the subject of his favorite speculation, seems to have rivaled the ingenuousness of a Simplicio. To obtain permission to publish his work he wearied the Florentine and the Roman courts, inquisitors, and pope with ceaseless applications. A happy event, he possibly believed, had opened the way to a new consideration of the Copernican theory. Cardinal Barberino, who had once saluted him with laudatory verses, and claimed his friendship, had ascended the papal throne as Urban VIII. The moment seemed propitious. The pope consented to the publication if Galileo would add to his work the arguments which Urban suggested as conclusive against the theory. A new preface was prepared, composed in part by the pope himself. After weary importunities and singular perseverance, the *Dialogue* appeared in 1632, splendid with the rare typography and careful illustrations of the Florentine press.

Had Galileo yielded to the counsels of Sagredo, who had advised him to take his ease and avoid all dangerous speculations—had he obeyed the voice of prudence or timidity, he might have won the favor of popes and inquisitors, and flourished in splendid luxury; Urban VIII. might have remained his friend, and he would have shone the chief ornament of the papal court. But the famous *Dialogue* must have remained unpublished, and the world might have rolled on for another cycle unconscious of its own insignificance. How many great philosophers, how many splendid discoveries, how many popular treatises on the heavens, what a wide range of human industry and of advancing thought, have sprung from the imprudent heroism of Galileo no intellect can estimate or describe. But there can be no doubt that when he gave his work to the press, knowledge received an irresistible impulse, and the barbarism of priests and popes a deadly blow. It is for this that the gratitude of the world has awaited Galileo, and that, as the martyr of science, his name is written among his favorite stars. The moon and the planets, the phases of Venus, and all the gems of heaven are his monuments.

Amidst the "flattery and fustian" of Italian letters his polished work was read with the intense interest of Macaulay's history or Dickens's novels. Cultivated men, we are told, almost snatched it from each other's hands. His disciples covered him with

compliments that were so extravagant as to seem ludicrous had they not been so sincere. To them he was the greatest genius ever known, the master of science, the interpreter of the universe. The people soon consumed all the first edition; there was no limit to his popularity; and from January, 1632, when the *Dialogue* was first printed, until late in the summer, no cloud disturbed the satisfaction of the author. He had sent copies, bound in leather and gilded, to the chief personages at Rome, to cardinals, inquisitors, and Jesuits, and he awaited, apparently with no unusual anxiety, the opinion of his spiritual masters. Suddenly, without an instant's warning, the thunder-bolts from Rome descended. Instigated by the Jesuits, an order came from the Inquisition directing the seizure of every copy of the work throughout all Italy. The Jesuits, Magolotti was told by a friendly priest, had determined to persecute Galileo bitterly. The pope, a person of violent temper, had been roused to intense rage against the author by an insinuation, that seems not wholly groundless,¹ that Galileo had meant to ridicule him under the guise of Simplicio. Urban never pardoned the supposed affront. He could scarcely bear to hear Galileo's name mentioned without expressions of anger. He sent an insolent message to the grand duke at Florence that, as a Christian prince, he ought to aid him in punishing so great an offender, rather than intercede for him. Jesuits, inquisitors, and Roman priests called out for the severe punishment of the great philosopher. They asserted that the *Dialogue* was designed to spread the monstrous heresy that the earth moved around the sun, that Galileo had violated the promise he had given in 1616, had defied the Inquisition, and assailed the church; and all the powers of ignorance and of darkness gathered together for the destruction of that clear and matchless intellect which was lifting mankind above its primeval barbarism.

Of the injustice of this persecution even the court of Florence, feeble and corrupt, could not avoid complaining. The grand duke's ambassador at Rome, Niccolini, a firm friend to Galileo, remonstrated, implored, used all the arts of diplomacy and intrigue, to avert his punishment. The Florentine ministry expressed to the pope their wonder that a book which had been read, amplified, criticised, approved, by the chief prelates and officials of both Florence and Rome, which had been authorized by the pope and sanctioned by the Inquisition, should now become an object of suspicion and alarm. They declared that Galileo denied all thought

¹ It need not be supposed, however, that the ridicule was more than general. The peripatetic Simplicio merely defends the Aristotelian theory. Galileo denied that he ever meant to ridicule Urban.

of disobedience to the clerical powers; that he had offered to leave Florence forever should the charges be proved against him; that he demanded inquiry, and was conscious of his innocence.¹ It can not be denied that Duke Cosmo stood boldly forward in defense of the famous philosopher, and that the conduct of Niccolini, his ambassador at Rome, deserves the highest praise. Florence, in its servitude and decay, strove to throw its shield, but vainly, over its Galileo. Its efforts were wholly ineffectual. Wasted by age and scientific toil, oppressed by a complication of painful and dangerous disorders, Galileo, when scarcely able to leave his bed, was first summoned before the Inquisition at Florence, and was ordered by the direct commands of Urban to appear before the Inquisition at Rome. If he did not come, the pope threatened to have him brought by force.²

His holiness, we are told by Niccolini, was of a temper irascible to the last degree.³ He would bear no contradiction nor suffer any restraint. Against Galileo he had been inspired by the Jesuits with a lasting hatred. He was resolved to inflict upon him such punishment as might avenge his personal injuries, and satisfy the discipline of the offended church. No thought of Galileo's personal sufferings, of his wide renown, of his useful labors, of his value to the world and to his age, seems to have softened Urban's resentment, or disarmed the malice of the whole company of the Jesuits. Galileo was summoned to Rome in October. Fearful of the cruel deeds of the papal city, his friends, by various excuses, put off the dangerous journey. It was only when Urban threatened to seize him and bring him before the Inquisition that Galileo set out for Rome. The grand duke, still careful of his illustrious subject, sent one of his own litters for his use, wrote to all the cardinals at Rome in his cause, and spared no attentions that could soften his pains. Yet the certificates of the Florentine physicians show that Galileo was in a condition of health that wholly unfitted him for motion, and his disordered frame promised a speedy end to all his woes.

It was in January, when the chill winds blew over the inhospitable country, when

the miserable roads of that early period were least fit for travel, when brigands wandered over the mountains, and the rude inns of the highways were least comfortable or tolerable, that the sad prisoner was borne onward toward Rome. Torture, and perhaps death, lay before him. The pitiless cruelty of the inquisitors toward every form of heresy was well known. He might well believe that his enemies meant to destroy him. The plague raged at Florence, and a rigid quarantine was kept up on the papal frontier. At a little village on the borders Galileo was detained for eighteen days, in the midst of a population of brigands and malefactors, without any of the comforts or conveniences necessary for his failing health. He was already losing his sight; yet he still wrote cheerful letters to his daughters, and, with natural magnanimity, strove to hide from them his dangers and his sufferings. On the 13th of February he reached Rome, and was received with a generous welcome by Niccolini and his equally attentive wife. Nothing that these excellent people could do was wanting to soften the sufferings, or prevent the imprisonment or torture, of the "good old man."

But no trace of pity can be found in the proceedings of the pope, the Jesuits, and the Inquisition. It was only by the incessant entreaties and kindly intervention of Niccolini that Urban was forced to refrain from the harsher treatment he had prepared for his aged prisoner. He was induced to allow him to remain some time in Niccolini's house. Galileo was seized, with a painful attack of gout, but on the 12th of April, after a long suspense, he was first brought before the congregation. The pope, in one of his bursts of passion, had ordered Galileo to be carried to the Inquisition, but allowed him to occupy the more comfortable apartments in the building.⁴ He was never, it is said, confined in the usual cells. The slow proceedings were protracted with pitiless indifference to his sufferings. He was examined a second time, April 30, and once more allowed to go back to Niccolini's house. On the 10th of May he was examined again, and ordered to prepare his defense. With a bitter anguish that nearly destroyed his feeble frame, he resolved, he consented, once more to abandon his scientific convictions, to yield every thing to his tormentors; but he was still unwilling, it seems, to confess openly that he had ever held the Copernican theory as a truth since 1616. Inquisitors, pope,

¹ The letter was never delivered to the pope, lest it might enrage him still more. *Private Life*, p. 210.

² The pope orders that Galileo shall be brought bound and in chains. *Statim postquam convalescerit et cessante periculo carceratus et ligatus ac cum ferris transmittat.* This is the tender treatment so admirable to the papal defenders.

³ Marino Marini, domestic chaplain of the present pope, has written a work in which he asserts the tenderness of the Inquisition toward Galileo, the gentleness of the pope. He asserts, page 6, che Galileo fu trattato con molta umanità. To threaten an eminent philosopher with chains and imprisonment for a scientific opinion, to try and condemn him, to silence and destroy him, is, it seems, unusual gentleness in the eyes of Pius IX. and his followers.

⁴ But for the intervention of Florence, it is plain that Galileo would have been treated with even greater cruelty. Marini thinks *La chiesa doveva necessariamente col mezzo del suo tribunale, la Inquisizione, opporsi a tutte sue possa a questa innovazioni, giustamente vi si oppone, e le punì.* It seems plain that had Galileo fallen into the hands of the modern Inquisition, he would have fared no better than with the old, had he defied its power. *Discorso Preliminare*, p. 6.

and Jesuits were resolved to force him to admit that he had done so, and that he had designed to teach it to the world in his *Dialogue*. The pope ordered him to be put to torture unless he submitted. The last examination took place on the 21st of June. What happened on that fatal day can not be said to be perfectly known. It is only certain that Urban and the Jesuits were willing to stretch upon the rack, to pierce with sharp torments, that feeble frame already perishing with disease, to wring by terror from that weary spirit some excuse for their cruelty. They seem to have failed. Galileo said to his tormentors, "I am in your hands; do with me as you please." And the minute of the examination continues, "As nothing further could be drawn from him, he was sent back to prison."

He was condemned,¹ as a suspected heretic, "to abjure, curse, and detest" the notion of the earth's motion; to recite each week seven penitential psalms for three years; to utter his solemn abjuration of his heresy in the presence of the congregation; to be imprisoned at the pleasure of the pope. He was to write and publish no more; to live for the rest of his life sequestered in his villa at Arcetri; to converse with no one; to perish in a living tomb. It was thus that the Jesuits and the infallible pope strove to chain a transcendent intellect, to crush one of the chief elements in the progress of modern civilization. His abjuration and his fall were celebrated with something of the publicity of an auto-da-fé. In the presence of the congregation of cardinals and inquisitors, with quivering limbs and broken frame, with a spirit humiliated by a consciousness that it had severed itself forever from the highest dignity of man, that it had sold its honesty for life and safety, Galileo, on his knees, his hands laid on the Holy Evangelists, pronounced, in a voice as loud as he was able—for this too was enjoined upon him—a falsehood dictated by the infallible pope. Immediately, as if to complete his fall, and to fix the memory of their own shame forever, the papal nuncios and agents were ordered by the Jesuits and the pope to announce to all the courts of Europe, and in every Italian city, the decision of the infallible church that the earth stood still, the punishment and abjuration of Galileo.

Some sense of shame has at last reached the Papal Church for its cruelty to the great philosopher, or at least for the extraordinary error in which its infallible head was evidently involved.² For many years after his death Galileo's name and discoveries were scarcely mentioned in Italy. In every Jesuit school he was branded as a heretic and

accursed. At length, as his fame arose in foreign lands, and the theory he had abjured was every where received, the papal writers began to apologize for their crime. They explained, they softened, and sometimes did worse. The controversy still rages. Jesuit writers labor to prove that Galileo was a charlatan and a plagiarist, and having once taken his life, would now destroy his fame.³ A reverend priest at Rome printed, while the present pope administered the Inquisition, a treatise to show that Galileo's offense was monstrous, and the mildness of the pope and the Holy Office most admirable. Of the Protestant replies it would scarcely be possible to speak. Yet on one point the recent discovery of the process of Galileo's trial at Rome has banished all doubt. It was Urban VIII. who directed and inspired the acts of the congregation; it was the infallible pope who declared that the sun moved and the earth stood still; that whoever believed otherwise was a heretic and an outcast from the papal fold.⁴

We may return to the last days of the martyr of science. Galileo, at the urgent appeals of the Tuscan court, was relieved of part of his punishment. He was confined for a time in the friendly house of the Archbishop of Sienna. At length he was permitted to return to his villa at Arcetri. Here he was kept in a close confinement.⁵ He was never suffered to go to Florence. Spies watched all his movements, and the Inquisition and the pope never ceased to torment their prisoner. Their rage was insatiable, and the great name of Galileo hung over them a perpetual menace. One fair and gentle spirit fell before their cruelty with her father, and Sister Maria Celeste, shocked by the news of his imprisonment and his fall, oppressed by the toils and miseries of her convent life, lay down and died, the spotless victim of a barbarous faith. It is one of the touching traits of Galileo's last days that he seemed to hear his lost daughter often calling to him.

Yet, had Galileo been revengeful, he might have enjoyed before he died the spectacle of the complete overthrow of the party of reaction in Germany and in England. The

¹ So in a recent papal defense. Gallée, son procès et sa condamnation. "We are assured l'invention de la lunette elle-même était bien plus difficile après ce qu'il savait de la découverte faite en Hollande, p. 22.

² And la sentence rendu contre Gallée n'a jamais reçu la sanction du souverain pontife, pas plus que le décret de 1616.

³ The question whether Galileo was really put to torture can not be decided except by conjecture. Par-chappe and Libri assert that he was; Marini, p. 53, that the silence of Niccolini and Galileo himself disproves it. Anche dal non farsi mai alcun motto di questa tortura nè dal Niccolini nè dallo stesso Galileo. It is only known that he was subjected to the extreme examination; that torture usually accompanied it; that his letters and those of Niccolini do not tell all the truth.

¹ Martin, p. 302. À genoux, les mains sur les saints Évangiles, il du lire à haute voix, etc.

² Marini, however, defends the Inquisition, and traces its origin to the Apostles. Discorso Prelim.

wasted and half-deserted home of the Reformation had been torn once more from the grasp of the Jesuits. Like birds of prey, they had been frightened from the carcass they were feasting upon. Gustavus had rolled back the tide of papal conquest; Germany was once more Protestant and free; and in England the persecutions of Laud were already arousing the fiery spirits of the Puritan reform. From all Protestant lands Galileo received the admiration and esteem of which the Papal Church had labored to deprive him.

He was now nearly blind, yet in extreme old age he could boast that he had made a discovery of singular importance. Of all the millions of men who had looked upon the fair face of the moon, no one had ever suspected that the silver disk had its periodical changes. Galileo discovered its librations. His dim eyes saw what had escaped all previous observers. At length he became totally blind. Even then the inquisitors still annoyed him with unexpected visits and with ominous threats. He was still too great to escape their envy. In 1638 he died, peacefully. After his death his enemies still pursued him, and it was even feared that his body might be cast out by the pope into unconsecrated ground. All Florence, touched by the memory of his greatness and his misfortunes, was eager to do honor to its last great name. A large sum was raised to erect a monument to Galileo. A splendid funeral was designed. He was to be laid in his family tomb in Santa Croce, amidst the pomp of a grand assembly of his countrymen. Addresses celebrating his deeds and fate were to be delivered before all the people. But enraged Rome interfered. The Inquisition, the Jesuits, and the pope forbade the obsequies. They declared that Galileo had held during his life false and heretical doctrine; that he was under the condemnation of the church.¹ Florence was forced to bow before the menaces of Rome, and Galileo went almost unnoticed to his tomb.

Almost in secrecy and silence his friends bore him to an obscure part of the church of Santa Croce. They were in doubt whether orders might not yet come from Rome to cast his ashes into the yellow Arno. He was buried in a distant chapel. No orator celebrated his wonderful career; no pulpit resounded with the catalogue of his great deeds, or weeping audiences lamented over the eclipse of the light of science; no mausoleum arose over his ashes. His name was seldom mentioned in his native city; his works were forbidden to be read, his memory lost. The priests would have been glad

to have erased his name forever from the records of fame, the Jesuits to appropriate his discoveries as their own. To assert the motion of the earth in the city where the theory had been first promulgated was long an act of impiety; to mention Galileo was to speak of one whom the infallible pope had banned as a heretic forever.¹

How vain are the decrees or the teachings of infallible popes! the story of Galileo may discover, and every where, in theology, politics, or science, the victory of the philosopher over priests and persecutors has been signally conspicuous. The various instruments which his busy fingers and inventive brain perfected or originated are found in every land expediting the course of civilization. The thermometer and the barometer have made the study of the air a practical science; the compass he perfected has become the guide of mariners and of travelers over arctic snows or blazing deserts; the magnet which he studied so carefully has proved the foundation of a new intercourse of nations; from his microscope has grown up a series of investigations that have opened fresh worlds of infinite expansion; in the optic glass of Tesolè, now grown to enormous proportions, the discoveries he began have been perfected, the planets he imperfectly sketched have been weighed and counted, the moon, whose rough surface he first detected, has been mapped and measured, and vast beds of stars he could never have seen, and suns of infinite variety, have revealed themselves to his accomplished disciples. On land and sea his optic glass has

¹ A letter from Galileo to Renier was forged—so anxious have the Jesuits been to hide the true nature of the trial—giving a pleasant account of the mildness of Urban and the gentleness of the Inquisition. It deceived Blot, but the forgery has been demonstrated. Parchappe.

² The pretext that Galileo was not condemned by the pope, but by a congregation, that therefore the pope never gave publication to the opinion that the earth stood still, the sun moved, or never decided that the opposite opinion was heresy, is too ridiculous to be any longer employed. It was the pope, Urban VIII., who began, guided, and completed the persecution of Galileo. It was the pope who ordered his imprisonment, and directed that he should never again teach the stability of the sun or the motion of the earth. An able article in *Macmillan's Magazine*, December, 1873, brings new light to the subject from the documents published by Epinoia. It was the pope who dictated the sentence of the congregation. It was Urban who threatened his former friend with torture, and perhaps inflicted it. The pope's injunction was, *ne de cetero scripto vel verbo tractet amplius quovis modo de mobilitate terre nec de stabilitate solis*; and the congregation declare, "by order of our lord [pope], and of the most eminent lords cardinals of this supreme and universal Inquisition," that it is an "error of faith" to say "that the earth is not the centre of the universe, and immovable." The other pretext, that Galileo was not condemned for a scientific but for a theological error, is equally preposterous. The records of the trial show that he suffered for a scientific truth. But what must become of the notion of infallibility when a pope not only asserts what is untrue, but proclaims it as the doctrine of his church?

¹ Urban never relented in his hatred, and persecuted Galileo even after his death. A fine monument has since been erected to Galileo in Santa Croce.

diminished the dangers of navigation or guided the evolutions of armies. The theory of the heavens he promulgated has become familiar to every creed, and theology has consented to be taught by the heretic and the martyr. Nor, could Galileo look once more on his beloved Florence, would he see inquisitors and monks preying upon a terrified community, or a hapless Italy wasted by pope and Jesuit; yet he would detect the same spirit ruling in the councils of the Vatican, the same hatred for advancing civilization for which he suffered, the same fierce resolution in its fallen inquisitors to cover once more Germany with the horrors of religious discord, and to invoke against united Italy the fanaticism of Europe.

ENGLISH LAND AND ENGLISH PEASANTS.

THERE are two reasons why Americans should be interested in the great uprising of the English agricultural laborers against the proprietors and farmer-tenants of English land. One is that it is stimulating the emigration to this country of a physically stalwart and tolerably skillful class, who will aid in filling up the fertile virgin expanses of the West, and will supply to the agricultural labor market material of an excellent quality. The other is that the wretched condition under which the English peasants exist, and have existed from a remote period, as betrayed by the facts which have been brought to light by the uprising, afford a very striking and suggestive contrast to the condition of the same class in the United States; and this contrast is calculated to impart contentment to the laborers who in this country find their situation to be one of comparative comfort and opportunity.

It is rather less than two years since the plain and unpolished Methodist revivalist, Joseph Arch, himself once a peasant, but risen by his own sturdy effort to the independence of a modest proprietor of his own homestead and farm, fired the dull mind of the agricultural serf with the sense of his injuries, the conception of his rights, and the courage of resistance. An article appeared in *Harper's Magazine* in April, 1873, giving an account of this man—his life, his adoption of the mission to elevate and better the class in which he was born and to which he considered that he still belonged, and the beginnings of his crusade against the tyrannies of landed property. Since that article appeared the movement of combination, organization, and resistance has gone on with a momentum which Arch himself did not probably foresee. The exposure of the miserable condition of the peasants throughout England, and even in many parts of less feudal Scotland, has constantly added new,

pregnant, and often startling facts to the evidence of which Arch was the rudely eloquent witness; and the peasants have proved themselves capable of exercising a formidable power which could scarcely have been anticipated a year ago.

The subject is a much broader one, moreover, than one of mere agricultural trades-unions, of strikes and lock-outs, of the conflict between a certain kind of capital and its corresponding complement of labor. It involves great questions and conditions lying at the very basis of English society and the English constitution. It comprehends the momentous subject of the tenure of land, the still substantial remains of the old English feudalism, the power and future of the hereditary aristocracy, and thus elements which are in the very centre of the structure of the monarchy.

The most obtrusive fact in the English social system is the contrast which exists between the enormous wealth of the few and the desperate and hopeless poverty of the many. The testimony as to this seems overwhelming; and often it comes to us from unwilling witnesses, from those who are themselves Tories and aristocrats. Sir Archibald Alison, the Tory historian of Europe, said, years ago, "What is unparalleled in the history of the world is the coexistence in England of so much suffering in one portion of the people with so much prosperity in another; of unbounded private wealth with unceasing public penury; of constant increase in the national resources with constant diminution in the comforts of a considerable portion of the community; of the utmost freedom consistent with order ever yet existing on the earth with a degree of discontent which keeps the nation constantly on the verge of insurrection; of the most strenuous efforts for the moral and religious improvement of the poor with an increase of crime unparalleled at the same or perhaps any other period in any civilized state." Lord Napier and Ettrick, who formerly represented England at Washington, is not less emphatic. In a remarkable address, delivered recently in London, this nobleman declared that in England "property is transferred and transmitted under laws, customs, and influences which all combine with irresistible and increasing power to produce consolidation;" and "in no country does so large a proportion of the population live in lodgings as in Great Britain, or in separate habitations as tenants at will; in no country do so many live on the land of others without a lease, or with a terminable tenure; in no country are the prerogatives and delights of landed property vested in such a restricted number." Lord Napier adds, with singular frankness for a man of his rank, "The proportion of those who possess to those who possess nothing is probably smaller in

some parts of England, at this moment, than it ever was in any settled community, except in some of the republics of antiquity, where the business of mechanical industry was delegated to slaves."

John Bright not long ago declared that there are one million people who are paupers on the parish in England, and that "another million are perpetually lingering on the very verge of pauperism."

Richard Cobden said, in the House of Commons, "There is not on the face of the globe a country where the peasants are what we see them in England; there is no country where, as in England, there exists a complete divorce between the peasants and the land."

An acute foreign observer, in the person of Louis Blanc, stated that "the English peasant is badly fed and badly housed; he is delivered over, without defense, to the attacks of old age; he has no chance of raising himself in the social scale."

The striking contrast between the enormous wealth of the very few and the desperate physical want and moral degradation of the very many is thus summarized by witnesses who know whereof they speak. Illustration of this in detail is at once more interesting and more instructive.

The enormous wealth of the very few may be judged by certain examples and facts, which are here given on credible testimony. There are thirty thousand great English land-owners, who together derive a land revenue of some sixty millions of pounds sterling. There are considerably more than a million peasants, who have hitherto been totally dependent for bare existence on the lords of the soil. One quarter of Scotland is owned by eight noblemen, of whom the chief are the Dukes of Hamilton, Buccleuch, and Sutherland, the Marquis of Bute, and the Earl of Breadalbane. The English county of East Sussex, embracing more than eight hundred square miles, is almost exclusively the property of the Duke of Richmond and the Baron of Leconfield. So extensive is the property of the young Marquis of Bute, whose income is fully three hundred thousand pounds a year, that not long ago his agent spent nearly two millions in repairing and altering his magnificent manor and estate of Crichton Mount Stuart, the marquis's residence near Cardiff. Mr. Bright once instanced the case of a nobleman with an income of one hundred and twenty thousand pounds, who annually spent forty thousand, and laid down the remaining eighty thousand in "rounding" his property, by buying up every parcel of ground contiguous to his estate which he could induce the owners to sell. This was one example of the pregnant fact that the land has long been in process of concentration in the hands of fewer and fewer possessors, thus ever widening the gap

between rich and poor. This tendency has been encouraged and protected by the still enforced laws of primogeniture and entail. To be sure, the law of primogeniture, as it now stands, only operates in the case of a proprietor dying intestate; and but very few large land-owners do die intestate. Nine out of ten, however, do as a fact leave the bulk of their real estate by will to the eldest son, to maintain the dignity and prestige of the family. The law of entail is far more serious in its results, as tying up land and perpetuating vast and ancient estates beyond peradventure. Simply stated, the present English law of entail enables the owner of a landed property to devise it for the term of a life in living, and for twenty-one years after; and this entail can only be cut off by the concurrent consent of two parties—the existing occupant and the heir. If, therefore, Lord Hardhunter has a son two years old, and that son lives to be eighty, Lord Hardhunter may, by an entail, easily cut the estate absolutely off from the market for a hundred years. In various ways this often works other injustices than that of restricting land in so small and overcrowded a country. The present Duke of Newcastle, having run through his fortune and a greater part of that of his duchess, went into bankruptcy loaded down with debts, one alone of which amounted to eighty thousand pounds. But the creditors could not touch his entailed estates, and so this noble bankrupt still finds himself in possession of one of the most enviable properties in the kingdom.

Among other immense properties of the few rich may be mentioned that of the Duke of Westminster, who owns, besides Belgrave and Eaton squares, and a large part of the fashionable quarter of Westminster, the magnificent manor of Eaton Hall, near Chester, Halkin House, in Flintshire, and Motcombe House, in Dorsetshire, each surrounded by thousands of arable but, to some extent at least, uncultivated acres. The Duke of Bedford owns the extensive group of squares in that central part of London called "Bloomsbury;" also Covent Garden Theatre and Covent Garden Market, many streets leading from the Strand on either side, and blocks of houses at the West End, and one of the most splendid of English rural estates at Woburn Abbey. The Earl of Derby may be said to own almost square miles of blocks in Liverpool, and Knowsley, his ancestral country-seat, is larger than most New England townships. The Duke of Sutherland is said to be able to ride by rail from sunrise to sundown on his Scottish estates, and has five noble castles—Dunrobin, House of Tongue, Trentham, Lilleshall, and Chifden. The Duke of Devonshire is the lord of no less than eight castles, all of which are rural palaces fit for royalty, among them peerless Chatsworth and the only less superb Hardwicke Hall. In Lon-

don he has a residence on Piccadilly, where land can be worth scarcely less than ten pounds a square foot, which is surrounded by gardens, and occupies a broad square. The eccentric Earl of Dudley, Earl Brownlow, the illiterate Duke of Portland, Baron Portman, the Duke of Northumberland, the Earl of Abergavenny, the Marquis of Salisbury, the Duke of Rutland, and Marquis Camden have immense rural properties, which are only exceeded in value by the whole quarters which they own in central parts of the great metropolis itself. The Duke of Buccleuch has ten castles, in each of which a liberal domestic establishment is kept up all the year round. The Scottish Earls of Mansfield, Stair, and Glasgow possess each five castles, vast and spacious edifices, the centres of splendid estates, which are to a considerable degree shut off from cultivation, and used as deer parks and hunting grounds. The income, probably, of every nobleman who has been named exceeds fifty thousand pounds; a majority of them would show revenues of one hundred thousand, and at least three of them, the Dukes of Westminster and Sutherland and the Marquis of Bute, receive annual incomes of more than three hundred thousand. Nor are the titled and hereditary aristocracy any longer the only great land-owners. In comparatively recent years the successful merchants, manufacturers, and bankers have been eager to secure what is called in England "a stake in the country." Again and again estates which have belonged to noble families for centuries, and whose entails have become exhausted, have been bought in by these *parvenus*, who in their turn have become lords of the manor and masters of peasant communities. Still a third class of landed proprietaries has been those of the church endowments. Thus we have three very powerful sources of social and financial power arrayed together to maintain the present condition of things, to keep the peasant where he is, and to defend the laws of primogeniture and entail from attack—the hereditary nobility, the manufacturing and banking princes, and the clergy.

Let us, having observed the vastness and splendor of English landed wealth, look at the reverse of the picture, and observe the depth and desperation of English peasant poverty. The "hind" or serf of the English soil has hitherto been the very dullest, most stolid, ignorant, and torpid of all specimens of human nature; but at last he has been aroused to self-assertion. The great strike of two years ago began in "England's garden," the fairest and richest of the English shires, where, "as you ride along the ever-famous highway between Coventry and Warwick, abundance seems written all over the fecund earth, laboring under its lavish crops, and adorned by its beautiful hedge-rows and

oaken avenues." But in the midst of all this plenty the peasant is half starved; in the most warmly cozy of English landscapes he is half frozen; amidst a universal growth and prosperity he alone grows not, but remains stunted amidst an arid existence, cut off apparently from all prospect of either material or moral advancement. But ideas grown on a branch of the tree of truth have a mysterious and subtle way of creeping by unseen ways into unexpected nooks.

The four great evils under which the English peasants in every shire have long been oppressed are lack of good food, lack of healthful and decent habitations, lack of adequate wages, and lack of education. Each of the first three involves to some extent all the others. With adequate wages the peasant might have procured himself good lodging and food; good lodging and food, provided by the landlord, would have stood in lieu of better wages. The wretched physical and moral condition of the peasant comes from an equal lack of all.

A moment's consideration of actual figures indicates the inadequacy of wages. In the southern counties, such as Dorset, Hampshire, Devon, and Somerset, the wages of the peasant range from nine to twelve shillings a week (\$2 25 to \$3). In the eastern shires, such as Cambridge, Suffolk, Essex, and Huntingdon, they range from twelve to fourteen or fifteen shillings (\$3 to \$3 50 or \$3 75). The recent great "lock-out" in Eastern England was caused by the demand of the peasants for fourteen instead of thirteen shillings. In the northern shires—York, Lincoln, Cumberland, Westmoreland, Durham—the wages range from fourteen shillings to one pound (\$3 50 to \$5). Thus the very highest wages in that part of the country where farm labor is most stalwart and most healthy consist of sixty to seventy-five cents a day, while in the great fruit, dairy, and garden produce counties the hind has to subsist as he may on forty or fifty cents a day. The period of daily work averages about twelve hours, though at certain seasons this widens to fourteen and fifteen hours.*

* Our attention has been arrested by a remarkable statement in one of our English exchanges, by Mr. Arthur Clayden, of Faringdon, England, in which he exhibits a picture of the struggle for subsistence, and even for existence, which the agricultural laborers of England are forced to make. We reproduce a portion of his statement, not so much to exhibit the miserable condition of this class in England as to inspire the similar class in this country with motives of thankfulness and contentment.

The case which Mr. Clayden has selected to exhibit the condition of the class for whose welfare he is laboring was that of a laborer, who had been summoned before the Petit Sessions of Southam to show cause why he should not be held chargeable with the partial support of his aged parents. The man's plea was absolute inability—his earnings being insufficient for his own support even, although his fare was frugal even to abstinence from many necessities. To prove his

Besides their regular wages the peasants are provided, either by the great landlord directly or by the tenant farmer, with what are very picturesquely called "cottages." We have a pleasantly romantic idea of the English rural cottage. Its thatched and moss-hung roof, its clambering woodbine and honeysuckle, its venerable age, its cozy

inability his solicitor submitted to the court a carefully prepared balance-sheet, which is at once a curiosity and an example of the poor living of tens of thousands of other laborers who are similarly circumstanced. After a scrutiny by the prosecutor, it was found to be impossible to object to this exhibit, and it was admitted in evidence. Here is a copy of this strange document:

RECEIPTS.	
Wages, at 15s. per week	£39 0 0
Extra 6s. per week during harvest month	1 0 0
Profits from allotment—sack of wheat, 18s.; potatoes, 10s.; beans, 15s.; straw, 15s.	2 18 0
Extra 8s. per week for hiring month	0 18 0
Value of vegetables from allotment and garden the year round	2 10 0
	£46 0 0
Less deduction for three weeks and five days of lost time, being one day per fortnight	2 17 6
Total income	£43 8 6

PAYMENTS PER WEEK.	
Rent	£0 2 0
Coals	0 1 6
Bread, five loaves, at 7½d. per loaf	0 8 1½
Rent for potato ground	0 0 7
Grocery	0 8 0
One gallon of flour for puddings	0 0 7
Pigs (cost price £2 and £1), per week	0 1 1½
Feeding same (barley meal, 17s.; stuffs, 11s. 6d.; beans, etc.), per week	0 2 6
Club money, per week	0 0 6
Wife's and one child's ditto, per week	0 0 1½
Man's clothing, 1s. 6d.; wife's and child's ditto and bedding, 1s.	0 2 6
Butter, 1lb, 1s. 4d.; cheese, ½lb, 6d.; beer for Sunday, 2½d.	0 1 11½
	£0 19 6

Total of 52 weeks' expenditure, at 19s. 6d. per week	£50 14 0
Total income	43 8 6
Deficiency	£7 11 6

An analysis of this poor man's expenditures for the necessities of life for himself and wife and child reveals a condition which is without a parallel any where in our land among laborers as a class. Though he was no idler, and worked the year round, with the exception of twenty-three days lost time, his total income for the year was, from wages, \$195, and from extra work and vegetables raised, \$20, or a grand aggregate of \$315. His expenditures, though made on a scale of which an American family of the same size would scarcely dream, in the course of the year were \$37 above his income; and thus the poor-house, to which he was forced to surrender his aged parents, stared him and his wife and child in the face, and extinguished all motive to further effort. It is notable that in the list of articles of food consumed by this family there is an utter absence of fresh meat, the only animal food used being the small supply of salt pork made from the one or two pigs raised on rations as insufficient as their own. There is an equally notable absence of milk, eggs, fruit, fish, and fowl; the entire outlay for tea, coffee, sugar, salt, and groceries of every kind for a family of three was limited to seventy-five cents per week; while the expenditure for bedding and clothing amounted to sixteen dollars and a quarter only for the whole year—a less sum than one of our laborers will pay for a single suit of clothing of the humblest kind, if we include under-garments and shoes.—*New York Christian Intelligencer.*

Vol. XLIX.—No. 291.—29

nestling among the rich dark green foliage, gratify the eye and fascinate the fancy. The reality is a sad and suggestive contradiction to all this. Spitalfields and the Seven Dials, the New Road and Smithfield, slums of overcrowded London, are not more reeking with disease, or with moral pestilences, than the wretched hamlets, in the midst of exquisite landscapes, of the English hinds. These peasant "cottages"—which are really for the most part miserable hovels—are classified in three kinds.* First, "cottages built of brick, of only one story in height, with a thatched roof, and without any cellar, so that the bricks or flags rest immediately on the earth, with two small rooms between seven and eight feet high, one used as the day-room and cooking-room, the other as the bedroom, where husband and wife, young men and young women, boys and girls, and very often a married son and his wife, all sleep together; without any garden, and with only a very small yard at the back." The second class is of cottages two stories high, with but two rooms, the upper being the bedroom. The third also has two stories, with four rooms, being thus considerably better than the others, but very rarely to be found in either England or Wales. The crowding in these miserable huts is something terrible to contemplate. The families and relatives sleep huddled promiscuously together. One witness speaks of "six people of different sexes and ages, two of whom were man and wife, sleeping in the same bed, three with their heads at the top, and three with their heads at the foot of the bed." Besides the ill health resulting from this, the moral effect is simply appalling. There is almost universal want of drainage, ventilation, and water supply. Sometimes the floors of the cottages are the primeval mud of the sites upon which they were built generations ago. A Church of England rector says: "The want of good cottages, where the members of a family can live separately, is a great cause of demoralization among the peasants. When grown-up members of the same family are continually occupying the same room, modesty and delicacy and sense of shame are soon put to flight. When these are absent, and dirt and disorder take their place, a gradual declension in good morals and character succeeds, and the whole family sinks imperceptibly to a lower grade in character and conduct." Another witness, equally credible, tells us that "some cottages have neither windows nor doors sufficient to keep out the weather, or to let in the rays of the sun, or supply the means of ventilation; in others the roof is so constructed or so worn as not to be weather-tight. The thatch roof is frequent-

* Kay's *Social Condition of the English People*, published by Harper and Brothers.

ly saturated with wet, and in a state of decay, giving out malaria, as does other decaying vegetable matter." A writer, describing the farm cottages of Dorset, says that he has often seen a spring bursting through the floor of some of them, and little channels cut from the centre, under the doorways, to carry off the water. The result of all this is the prevalence of agues and fevers, small-pox, scarlet fever, and other epidemics caused by exposure, cold, damp, bad ventilation, insufficient food, crowding, dirt, which would be incredible were it not attested by the reports of health and the actual experience of witnesses. Many of the cottages in Devon and Somerset are seen rapidly decaying; they are often so rickety and ruined that to inhabit them is a simple impossibility; with others "the process of demolition or decomposition has only commenced, confining the wretched tenants, who had formerly two rooms, to the only apartment which remains, and which they can with difficulty keep together."

The following is the suggestive picture of the habitations in the picturesque village of Southleigh, in Devon, where, in the peasant cottages, the world-famous Honiton lace is made: "In cottage after cottage there are clay floors; low ceilings, letting in the rain; no ventilation; gutters running through the lower room to let off the water; unglazed window-frames, sometimes boarded up, sometimes uncovered to the elements, the boarding going for fire-wood; the inmates disabled by rheumatism, ague, and typhus; broad, stagnant, open ditches close to the doors, and heaps of abominations piled round the dwellings. Such are the main features of Southleigh, and it is in these worse than pig-sties that one of the most beautiful fabrics that luxury demands or art supplies is fashioned."

The food of the peasantry, in most instances, is but a degree better than that supplied to the live stock of the farms. Grist-bread, in some localities, affords the only food which the farm laborer has. There are whole communities which do not taste meat a dozen times a year. Many of these wretched households subsist wholly on wheaten cakes and potatoes.

Of the moral condition of a class which is found in very nearly every rural locality in England it is almost unnecessary to speak. Crimes of the baser and meaner sort are more rife in the shires than in the large towns. Convictions occur in the county of Dorset to the extent of one in every sixty of the population. The marriage tie is borne loosely, and in a multitude of instances utterly disregarded. Drunkenness is rampant, for the peasant is hopeless of bettering himself, and spends as he earns. A dull sense of desperation seems to possess him. He lives the life, almost literally, of a beast of burden.

The intellectual and political condition of the hinds is yet more deplorable than, and proceeds directly from, the utter degradation and wretchedness of the physical condition which they have inherited from previous generations of laborers. The land system of England, built up and sternly maintained to aggrandize the possessions and support the political and social grandeur of the great landed proprietors, forbids these men to help themselves, deprives them of any inducement to save and be temperate. The peasant is unable to buy a plot of his own, or even to lease it at will. He is only too glad of the shelter of a miserable hovel. At the least manifestation of insubordination, whether the matter touch his work or his conscience, he is liable to be cast into the road, with wife and babes, without hope of being employed by the squires who are the neighbors and friends of his last employer.

It has been the deliberate aim and purpose of the landed proprietors to keep the peasantry in ignorance; and in this they have, up to within a year or two, met with complete success. They have adopted the spirit of the famous couplet of the aristocratic poet, Lord John Manners:

"Let laws and learning, art and commerce die,
But give us still our old nobility."

The peasant has been doomed not only to ignorance himself, but to see his children grow up in an ignorance as dense and hopeless as his own. The squire and farmer have been in the habit of regarding education, as applied at least to peasants, as an interloper, a conspirator, and a nuisance. When, a year or two ago, the new system of national education was established, by which each locality was permitted to elect a school board or not as it chose, in the farming districts school boards were almost invariably voted down by large majorities; and to-day the boon of universal and free education, made permissive by Parliament, is rejected in those places where the rural magnates and the established clergy possess the dominant influence. "It is impossible," says an English writer, "to exaggerate the ignorance in which the peasants live and move and have their being. As they work in the fields, the external world has some hold upon them through the medium of their senses; but to all the higher exercises of intellect they are perfect strangers. You can not address one of them without being at once painfully struck with the intellectual darkness which enshrouds him. There is in general neither speculation in his eyes nor intelligence in his countenance; the whole expression is more that of an animal than a man. Education has advanced him but little beyond the position which he occupied in the days of William the Norman. The farm laborer has scarcely participated at all

in the improvement of his brethren. As he was generations gone by, he is now—a physical scandal, a moral enigma, an intellectual cataleptic." The average age at which the peasant children attend the primary schools is constantly sinking. Most of them leave school to begin their long and weary life of drudgery at nine years of age. They leave it with a blundering knowledge of reading and writing. "Many of them are instructed by poor ignorant women, who just know how to read, write, and cipher." As a matter of fact, a large majority of the English peasantry do not read or write.

Up to the time that Joseph Arch organized the agricultural unions the political and social condition of the peasantry was almost exactly that of the old vassal communities, owing an unquestionable allegiance to the lords of the soil. The "rotten boroughs" were, indeed, abolished by the Grey Reform Bill of forty years ago; but the supremacy of the lords and squires was still maintained, and is only now being sapped. The peasant who, perchance, was sufficiently well to do to occupy a house with an annual rental of ten pounds had, to be sure, the privilege of the suffrage, but his vote was completely at the disposal of his landlord. The latter has held one arm over him which he has found it impossible to defy—the threat of eviction. The land on one hand is so stringently restricted in a few possessors, and the country is so overcrowded with half-starving hinds on the other, that eviction means, in most cases, to be reduced to the last desperate stage of extreme poverty. The law has hitherto utterly failed to confine the power of eviction. The peasant has been completely at the landlord's mercy; and thus the landed aristocracy has been able to exercise a degree of political power far outweighing the legitimate political weight of the great industrial centres.

Such was the state of the rural society, such the degree of the wealth of the few and of the poverty of the many, when the sudden, unexpected, and wide-spread uprising of the down-trodden peasants took place. What a change has already been wrought by the sequel of that event! A year ago but six English counties had agricultural unions; now there is no county without its county union in England and Wales, and but three or four in Scotland. A national agricultural union was formed, with its head-quarters in London, in the summer of 1873, and Joseph Arch was made, and still continues, its president. This union is provided with funds to aid the strikers in the country; and from it is constantly proceeding an inspiration to the peasants to continue their course of self-assertion. It is said that, whereas a year ago there were scarcely fifty thousand peasants belonging to the unions, there are now more than two hundred and fifty thousand—more than one-

fourth, probably, of all the adult male peasants in Great Britain. These combinations, besides giving a new hope and purpose to the peasants of elevating their physical condition, have fulfilled and are fulfilling three practical collateral projects, all bearing directly upon the peasants' welfare. Clubs have been formed for the recreation of the rustics, supplied with games, papers, in some instances with gymnasia, where occasional lectures, readings, and exhibitions are given. These have already produced excellent results in diverting the peasants from the village gin-shops, and awakening self-respect and a desire for knowledge. The second collateral result has been the organization of a system of intermigration in England itself. Laborers have been transferred from shires where there was an excess of hands to shires where labor was in demand. In some cases agricultural hinds have transferred their calling to the northern factories, thus ranging themselves with the artisans. The third result has been the increase of emigration from the shires abroad, especially to Canada, Australia, New Zealand, and other English colonies. The peasant is famous for his stubborn adherence to the soil where he has lived and where his fathers have lived before him; but hundreds have been induced to "pull up stakes" and cross the seas in quest of new homes and a good opportunity to rise.

But their condition at home is already notably improved, thanks to their own tardy but at last vigorous action. Higher wages have been forced from the squires and farmers in many localities. The more humane landlords, their attention having been called to the wretched condition of the cottages on their estates, which, likely enough, they have themselves never seen, are heard of here and there pulling them down and erecting neat plastered huts. Politically the peasant has before him a hopeful future. The ballot is now the law of England, and the ballot means the protection of the unhampered right of the dependent classes to vote as they please. The uprising of the peasants has, moreover, created an agitation to extend household suffrage, which now applies only to the towns and boroughs, to the counties. If this extension of electoral rights is accomplished, as it is certainly destined to be before many years, every peasant, though he may live in a hovel, will be able to vote in secret. Thus a political force will be called into action which will, unless the landed interest takes time by the forelock, and courageously abolishes the system of serfdom that now exists, be thrown into the scale against the immunities and privileges of landed proprietorship. Such a conflict must be no less bitter than that which has raged for years between the capitalists and artisans of the

industrial towns, and will be far more serious in its results upon the English social and political system. The peasant brain is slow to receive new ideas; but an idea once lodged in their hard skulls, is lodged there for a long sojourn. The glamour of the old submissive feudal loyalty is passing away

from before the dull eyes which once it dazed. A notion of rights long abused, of possibilities before unthought of, of a resistance which may be effectual, has taken its place; and its development by persistent action may prove to be the doom of feudal England.

Editor's Easy Chair.

WHOEVER has been in Washington has observed at the foot of the grounds of the White House, toward the Potomac, a white structure which seems to be a huge abandoned or abortive chimney. "Some factory," the traveler muses, "cherished by a Congress patriotically resolved that the national capital should have at least one seat of useful industry, has here struggled and expired, leaving only this solitary sign of its being." The idea, although an evident failure in accomplishment, seems to him worthy the genius of his native land. For surely the spirit which resolved that on the banks of the Tiber, or the shores of Goose Creek, a great national city should arise, might well resolve that it should be the seat of great and productive industries. The situation, indeed, is perplexing. Why the factory should have stood between the Executive Mansion and the river is not evident. The President, looking southward from his windows, weary with the care of state, might have been supposed to be more gratified and refreshed with a landscape unsuggestive of toil. Or was there a deep moral purpose in the choice of situation, and was the humming home of industry intended to remind the Chief Magistrate that this is a land of labor, and that he and all his fellow-citizens are but workmen, and that pride and pomp and luxury are unbecoming the chief of such a state?

At this point of the traveler's reflections, in the beautiful days of May, for in Washington "then, if ever, come perfect days," some denizen of the city, anxious that he should see all its glories, asks him, perhaps, if he has seen the Washington Monument. It is not impossible that, in the patriotic exaltation of mind which the great city produces, he may wave his hand in space and reply, "Si monumentum queris, circumspecte!"—meaning, and with truth, that all America is his monument. But in more moderate moments he will submit to the sight-seeing, and going to gaze upon the monument of Washington, he will be confronted with the chimney of his meditations. This, then, is no obliterated factory surviving in an imperfect chimney, but a memorial of grateful honor raised by a nation of forty millions of people to the first and greatest of its citizens. The Union under the Constitution is only eighty-five years old, but the grateful people have been ninety-one years building a monument, and have already done what you see. Washington has been dead not quite seventy-five years. The national city was first occupied by the government seventy-four years ago. There is no name so dear to the country, and this chim—monument is the result of our filial devotion to his great memory.

Congress has been looking into the matter. In 1783 it tells us that it was decided to erect an equestrian statue to the chief of the Revolution, to be supported upon a marble pedestal, which was to be sculptured with designs of great events of the war. Of course the most illustrious artists were to be employed, and the most inspiring scenes were to refresh the patriotism of the citizen, and inspire the eloquence of Congress. This was the noble intention. It was worthy of Congress, of the country, of human nature. And nothing was ever done. Not even a beginning was made. Presently Washington died. Then there was a new plan—the plans were always new and of immense patriotism. This time there was to be a marble monument, under which his dust was to be placed. Mrs. Washington was asked to permit the body to be removed from Mount Vernon, and she assented. Every thing was ready—to be made ready. Nothing was wanting but a beginning. There were some solemn legislation and a great deal of noble sentiment. But no appropriation was ever made, and nothing whatever was done.

Then there was another plan. Indeed, there has been a touching fecundity of plans. This time it was the year 1833, and a voluntary association of citizens, with characteristic American enterprise, resolved to erect a monument without government aid, depending upon private contributions. Only forty years have passed, and the results are inspiring. During the last twenty years the monument has grown four feet in height. Private subscriptions have long since ceased. A few hundred dollars are collected every year from small investments, all of which are expended upon maintaining the work of national gratitude in its unfinished condition. Meanwhile, however, the State of New York has promised ten thousand dollars—when sufficient other money has been collected to enable that sum to finish the shaft. New Jersey has promised three thousand dollars, and Minnesota two thousand—upon the same conditions; while California, more generous, has resolved to give a thousand dollars a year until the monument is finished—but has not yet begun to pay.

In this situation of affairs, it is encouraging to contemplate the vast design. It is something to see what was meant to be done. As it was to be an American work, it must of course be higher than any structure of the effete monarchies. The wretched little Great Pyramid of Cheops is only four hundred and eighty feet high; yet that is the highest point that despotisms have been able to reach in architecture, and that Pyramid is the loftiest structure on the globe. Few spires are so much as four hundred feet high. If pyr-

amids were sensible of shame, how that of Cheops should hang its head to know that the transcendent American shaft was one hundred and seventy feet high more than twenty years ago, and is now one hundred and seventy-four! It is "going to be" SIX HUNDRED feet high! Poor Cheops! To be sure, there are some mistakes to correct. But who is infallible? The shaft "deflects" an inch and a half from the perpendicular, which is nothing. Then the stone has been so dressed, beveled, et cætera, as to throw an excessive weight upon the outer edges. Then in violent winds there will be "an excess of pressure on one side of the foundation over that on the other of nearly five tons per superficial foot." And this pressure, the engineer says, "will be greater than the entire pressure upon any earth foundation I can find recorded." Therefore, by changing the plan—all the drawings and specifications of which have been lost—and reducing the scope of the work, the monument may be finished in two years, at an expense of somewhat more than three hundred thousand dollars. And private patriotism and grateful zeal being exhausted, the committee want Congress to appropriate the money.

This is the proud story of the Washington Monument. So far as it is finished, it is one of the blankest, ugliest, and most unmeaning piles that encumber the surface of the globe. It lies like an incubus upon a lovely landscape, and the money that should be applied to its swift removal would be money wisely spent. The city named for him is Washington's monument, while this mass of marble-faced stone and brick is the memorial of public indifference not to the great Father of his Country, but to this form of remembrance. In the square in front of the Capitol stands the statue by Greenough, the butt of easy wit, but a noble and inspiring figure, full of significance and grandeur. The city, with such a monument, was rich in specific tributes to Washington, and even should the shaft be completed, it would be an unmeaning memorial.

SPRING returns, but the anniversaries return no more. Charles Lamb remarked the Decay of Beggars in the metropolis. And the life and aspect of every great city are constantly changing. In Newport the yearly meeting of the Quakers still continues. Last year we saw the gentle folk in the green grounds of the meeting-house, and remembered the older days when their mild avatar portended rain. The hats and coats, and especially the hoods of the other sex, with the plain kerchief and spare skirt, seem to have gone out. In Philadelphia, indeed, they may be sometimes seen; but in Providence, where there were knee-breeches within memory, knee-breeches are no more. New Bedford also had some of the kindest "Friends." Are they also merged or merging in the world's people? The anniversaries in New York were of the great benevolent societies. They were almost all of a religious character, although that name would have been stoutly denied to the antislavery meetings which twenty-five years ago were held at the old Tabernacle just below Leonard Street in Broadway, and were the most exciting of all the assemblies of the week. The saying was that eloquence was dog-cheap at those meetings. The orators at the "anniversaries" were mainly clergymen, and

enormous sums of money were raised and spent by the societies.

Are people weary of charity and missions and temperance and moral reforms? Does the decline of the anniversaries argue the decline of public morality? Or is it only that the fashion of the times is changed? The latter is more nearly the truth. The great organizations for domestic relief were never more efficient than now, and the anniversaries are taking a less technical and imposing form. The annual meetings are replacing them, and the advantages of the great parade are becoming less obvious. Moreover, the force of satire, the portrait of Mr. Honeythunder and the other philanthropic brethren, have modified the meetings by promoting greater self-consciousness. There is a suspicion that public and vociferous goodness, the self-celebrating virtue, has become a little absurd to the popular mind, and the glory of the platform has consequently waned. Yet there are always good things to hear during the famous May days at the meetings, old and new, which are still held. The Yankee—in the large sense—is not likely to give up his public meeting or his speech, and he will try to open the mouth of every stranger and hear what he has to say about it.

Perhaps the pleasantest sign of the times from this view is the greater general charity and good feeling which prevail at all the meetings. The influence of the Evangelical Alliance in this respect is very evident. When the clergymen of all the evangelical sects stood together in Dr. Adams's church, and Baptist, Methodist, Presbyterian, Reformed, and Congregationalist all united with the Dean of Canterbury in repeating the Episcopal creed, it did not show that the millennium was at hand, but it did certainly show that men were wiser. In the same church a few months later Dr. A. P. Peabody, of Cambridge, a Unitarian, was invited by the faculty of the Presbyterian Union Theological Seminary to deliver a course of lectures upon Science and Christianity. Fifty-five years ago Dr. Channing, the teacher of Dr. Peabody, was admitted to no pulpit in New York, and only with great difficulty was allowed to preach in the hall of the Medical College, then in Barclay Street. It is such facts that show us how "behind the clouds the sun is still shining." Mr. Cowdin in a late interesting address reminds us that Dr. Lyman Beecher, who went to Boston more than fifty years ago to withstand the heretical Channing, when he afterward went to the West was himself charged with heresy. And if Dr. Channing should return to-day, no man would open his pulpit to him more quickly than Dr. Lyman Beecher's son.

All this, although it may be coincident with the decline of the anniversary zeal, does not show that the world is getting worse, or that religion is declining. Indeed, the most significant fact in the meeting of the Evangelical Alliance was the spirit it showed rather than any doctrine it preached. And this was also the secret of the interest excited by a modest gentleman who chanced to be here during the anniversary season, but who took little part in any public exercises—the Rev. Dr. Tullock, principal of St. Mary's, in the University of St. Andrews, in Scotland. On the last evening of the general meeting of the Social Science Association he chanced to be in the hall while President White,

of Cornell, read his vigorous paper upon the relations of government to the higher institutions of learning, and during the shrewd and eloquent reply of President M'Cosh, of Princeton. After Dr. M'Cosh had spoken, Principal Tullock made a little speech in sympathy with the views of President White, so simple and earnest as wholly to captivate the audience. It was, indeed, a plain talk, so full of good sense that every hearer in his heart congratulated St. Mary's of St. Andrews on its good fortune. The tone of the little speech was generous and catholic, and therefore most manly; and the same tone distinguished a lecture which Principal Tullock subsequently gave upon the condition of religion, society, and politics in Scotland.

He said that Scotland is intensely Presbyterian, but the Church is divided into three bodies—the Old National Church, the Free Church, and the United Church. The Old is by far the largest, comprising about one-half the population, or fifteen hundred thousand persons; one-fourth, or seven hundred and fifty thousand, belong to the Free Church, and one-seventh to the United Church; one-eleventh of the population are Roman Catholics, and one-forty-fourth are Episcopalians. His hope was a union of the Presbyterian churches, but he was sure it could be accomplished only by concession. In all he said Dr. Tullock showed the same excellent humane spirit. In speaking of the political situation, he said that Scotland was Liberal, and that the great mass of the people had supported Mr. Gladstone in the disestablishment of the Irish Church. But this support did not spring from hostility to an established church, but from the conviction that the Irish Church was in no proper sense a national institution. Evidence of this he found not only in his own observation, but in the late election, when the Conservatives gained eleven seats. Dr. Tullock thinks the explanation to be that the Scotch people "don't think extreme radicalism characterized by good sense." And he added something which, however just his own application may or may not have been, is well worthy the reflection of political and party managers: "The last election in Scotland, I think, has shown us that there are there, as in all countries, men who don't go to platforms, who don't write in newspapers; men who are intelligent and cultured and liberal and thoughtful and sensible; and the great mistake all extreme politicians make is in ignoring this class, and taking into consideration the men who shout most."

The social habits of Scotland in the beginning of the century are vividly drawn in the admirable life of Archibald Constable lately published. The stories of the drinking among the best classes of society, in that book, are prodigious. And Thackeray used to tell others like them in his more modern day at Edinburgh. Dr. Tullock does not deny that John Barleycorn is still a reigning potentate. In Edinburgh, he says, there is a vast amount of social suffering, one source of which is drinking. It is "a national characteristic," he admits, and he will not deny it. The discomfort of the climate may be some reason, and in a sad and gloomy climate it is very hard to contend with such a mischief. The churches and special societies are struggling with it; but the vast mass of the pauper population, among which are the drinkers,

do not go to church. What to do he does not know. The churches must modify their system before they can reach the drinking class.

These words show how wide and how weighty the problem of drunkenness has become. Yet it must be always remembered that if it seems to us a growing evil, it is perhaps only because attention is more earnestly directed to it, and because, therefore, statistics are more carefully collected and generally known. The reader of newspapers might suppose that deaths and disasters by lightning were very much more frequent in modern summers than formerly if he did not reflect that by means of the telegraph universal publicity is now given to every instance. Mr. Herbert Spencer, who has perhaps more carefully studied and collated the facts of "sociology" as a ground of induction than any other man, says that drunkenness is really diminishing. His remarks, for the reason mentioned, are so important and so little known that we quote them as a contribution to the general discussion:

"In generations not long passed away sobriety was the exception rather than the rule: a man who had never been drunk was a rarity. Condiments were used to create thirst; glasses were so shaped that they would not stand, but must be held till emptied; and a man's worth was in part measured by the number of bottles he could take in. After a reaction had already diminished the evil among the upper and middle ranks, there came an open recognition of the evil, resulting in temperance societies, which did their share toward further diminishing it. Then came the teetotal societies, more thorough-going in their views and more energetic in their acts, which have been making the evil still less. Such has been the effect of these causes that for a long time past, among the upper classes, the drinking which was once creditable has been thought a disgrace, while among the lower classes it has greatly decreased, and come to be generally reprobated. Those, however, who carry on the agitations against it, having had their eyes more and more widely opened to the vice, assert or imply in their speeches and petitions that the vice is not only great, but growing. Having in the course of a generation much mitigated it by their voluntary efforts, they now make themselves believe, and make others believe, that it is too gigantic to be dealt with otherwise than by repressive enactments—Maine laws and permissive-prohibitory bills. And if we are to be guided by a select committee which has just reported, fines and imprisonments for drunkenness must be made far more severe than now, and reformatories must be established in which inebriates shall be dealt with much as criminals are dealt with."

We do not stop to discuss what Mr. Spencer says, but only to point out that one of the most competent observers of the time says that drunkenness is diminishing, and that the influences of which Dr. Tullock speaks have produced most excellent results. And should Congress authorize the commission for which the friends of the temperance movement have asked, to collect statistics in this country, there will be an immense collection of valuable information to throw further light upon the problem. The spirit of Anniversary Week, the patient reader will remember, was singularly discursive, and if we seem to

have strayed from the text, it is only because of obedience to that spirit.

THE floods of the spring have made a peculiar and most persuasive appeal to the public generosity, and it has been nobly met. The disaster in the lovely Mill River Valley, in Massachusetts, was so sudden and appalling that it impressed the imagination more profoundly; but the devastation upon the shores of the Mississippi, although more gradual, and for that reason less immediately shocking, is undoubtedly one of the greatest calamities of the kind that has ever befallen the country. Mr. Crowell, of Boston, was sent to Louisiana to ascertain how the money contributed by the citizens of that city had been applied, and his report was a most painfully interesting story. The magnitude of the flood and of the area of destruction has not been understood in other parts of the country. Thus in going to Brashear, eighty miles beyond New Orleans, Mr. Crowell passed for the last twenty-three miles through an apparently boundless lake, varying in depth from three to six feet, pouring from distant crevasses on the Mississippi, and wasting enormous districts of country. Two hundred miles up the river, at Port Hudson, he saw the vast volumes of water rushing through the crevasses—the streams varying from five hundred to fifteen hundred feet in width, and from seven to twelve feet in depth, roaring like cataracts, and sweeping every thing away. The suffering among the people is, of course, indescribable. More than fifty thousand men, women, and children were made homeless. Their helplessness must continue until the corn crop matures; and it was hoped that if aid were continued, corn and cotton might be planted upon thousands of acres as the waters subsided. The owners of the land have necessarily lost the basis of their credit, and could hardly feed their families, much less other dependents, and all summer long there will be constant need of aid. The reader of these lines may yet do something. "Even a loaf may save a life," says the *New Orleans Times*. "The mighty river" that has desolated the land "has its sources in gentle rivulets." Let the great stream of charity that shall renew and bless the land have similar springs!

The relaxed social and political condition of Louisiana makes aid at home and from the State more difficult. Congress has wisely helped; for as the suffering is extraordinary, so must the relief be. Yet up to the time at which we write, New York, usually so swift with the helping hand, seems hardly to have comprehended the extremity of the case. Its response to the awful and sudden need in the Mill River Valley was prompt and full. But Massachusetts, a compact, orderly, and highly organized State, naturally declined any aid from Congress, and addressed itself at once to present relief and to future prevention. Fortunately stringent laws, well executed, can secure a valley from the mischief of a weak reservoir; but what law, what power, what foresight, can tame the Mississippi, or stay its swelling floods from the low shores beside it?

There is one pleasant aspect even to the sorrowful picture of this Southern desolation, and that is the healing influence of charity under the

circumstances of the country. This year has seen a completed restoration of good feeling. On Decoration-day the flowers were strewn equally upon all graves of the war, brave hearts remembering only that all were American. The same feeling speaks in every word of sympathy, and is shown in every kind act between the sections of the country that were lately alienated. They who suffer are our brethren; and under the flowers that show fraternal sympathy, and in the generosity with which the Northern heart responds to Southern loss and sorrow, are laid the deep foundations of that true and new Union which every patriotic American heart would gladly build.

SOME years ago the Easy Chair was walking—if its motion may be described by such a word—with the late Gulian C. Verplanck, the delightful scholar and Knickerbocker, down Broadway. At Canal Street Mr. Verplanck said, "I remember very well when a little stream ran along here through the fields, and that we used to cross it by a rude bridge as we went farther out upon the island hunting and fishing." It is not more than thirty years since the square between Waverley and Washington Places, upon the Broadway end of which now stands the New York Hotel, was a leafy country place, around which in those earlier days Mr. Verplanck and his companions may have shot and fished; and Corporal Thompson's cottage at Twenty-third Street seems to have vanished but yesterday. The changes of modern New York are so swift and complete, and the city was so constantly occupied by the British during the Revolution, that it has hardly that historic interest or hold upon its citizens, or, indeed, upon the country, which the greatest city upon the continent should have; and it was a good service which Mr. J. W. Gerard did when at a late meeting of the Historical Society he read a very careful and elaborate paper upon old New York.

It is full of entertainment, and it would be a delightful manual for the strangers from every part of the country who come to the city, because it invests its most familiar spots with the romance of old and quaint association, giving to the city the very charm which to so many of its visitors it now so sadly lacks. Here, for instance, is the island of Manhattan itself, for the whole of which Mr. Peter Minuit paid twenty-four dollars in wampum two hundred and fifty years ago; and fourteen years later the present stately metropolis of the Western World consisted of about twenty log-houses upon the southeastern shore, the East River side of the Battery. Mr. Gerard makes a claim for the Dutch settlers upon the Hudson which the mild denizens of the leafy shores of the Delaware who call William Penn father will probably carefully consider. They had a rigid regard, he says, for the rights of the Indians, and no title was deemed vested until the savage proprietor was satisfied. Hills and marshes which have now vanished then marked the well-wooded isle; and the late sanitary explorations and maps of General Viele show that those marshes still assert themselves in the unhealthiness of certain parts of the city which have not been duly drained, and he curiously draws the worst cholera lines as almost identical with the lines of the extinct swamps. And the red man preyed upon the settlers so that when the little hamlet was

twenty years old a Jesuit father laments their sufferings as "grievous to see."

Mr. Gerard describes, with the faithful eye for details of Gerard Dow, the interior of one of the early Dutch houses, and with an unction that Washington Irving would have enjoyed. The houses seem in his description to have been the homes of happy peace and content, and the industrious men and notable housewives to have been the very folk of Arcadia. As the brightly gossiping annalist passes through the Broadway of to-day he finds it a palimpsest, and shows us the remoter characters beneath. This building, for instance, seems to us Trinity Church rising from among the tombs of the grave-yard: but no; before even the older Trinity Church was, this is the garden of the West India Company, stretching to the river, along which its locust-fringed bank was the sweet resort of Dutch lovers long ago. And here, near the corner of Battery Place, where later Washington's headquarters were, was the huge town windmill, around which, as a common resort, there was naturally a kind of exchange, where the last rumor of the town, or the news from the Old World or from New England, or the late vigorous sermon of the dominie, was discussed.

Near the corner of Pearl and Moore streets was the market, to which came all the country people in wagons or boats, or upon horses, and the Indians in canoes and shallops. The countrymen brought veal, pork, butter, cheese, roots, and straw from the farms. Then there were venison, milk, tobacco, peaches, and "smoked twaefit" or striped bass, and oysters, "Gouanes" oysters—not less than a foot long, as an enthusiast of the time records—oysters which might well make Dorlon drop pearls of anguish as he contemplates his Saddle Rocks of not more than half that length; and plenty of cider and herbs and melons and Indian maize and Turkey wheat. At the close of the day the little boats return laden with medicines. Barbadoes rum, Muscovado sugar, arrack, "olykoeks," and gingerbread, fresh ribbons and caps, and stuffs of linsay-woolsey. As the farmers and their wives, and the citizens and their wives, and the lads and lassies, chattered and chattered, the wars of the famous Dominie Everardus Bogardus, the second minister of New Amsterdam, and Director Kieft and the other governors were unquestionably thoroughly discussed. Mrs. Bogardus was the Anneke Jans whose descendants to this day are perpetually summoned to meet somewhere

and do something with an ultimate view of acquiring immense estates.

It is very amusing to read in the same newspaper which tells us that the Duke of Montebello recently challenged Prince Metternich to mortal combat because the princess, without the prince's knowledge, asked the duke not to speak to her any more—very comical, we say, to read in the same paper the lively essay of Mr. Gerard, which informs us that Dominie Bogardus two hundred and thirty years ago sued Anthony Jansen Van Salee because Mrs. Van Salee had slandered Mrs. Bogardus in saying that on one occasion when that lady was passing through a muddy part of the town she had shown more of her ankles than was necessary: and she the dominie's wife! There was swift judgment of the court, and Mrs. Van Salee was compelled to declare in public, at the sounding of the bell, that she knew the minister to be an honest and pious man, and that she had lied falsely; and she was further condemned to pay costs and three gulden to the poor. When will such execution be done upon Mrs. Grundy? Director Kieft charged Dominie Bogardus with constant intoxication, that he loved strife, and (oh, heel of Achilles!) that he preached stupid sermons. The dominie denounced the director from his pulpit as a consummate villain, and declared his (the dominie's) goats to be a superior kind of animal to the director; and on one occasion announced that on the next Sunday he would publicly—from the pulpit—give the director such a shaking that they would both shudder. The director was prepared, and, to drown the thunder of the dominie, would have the drums beaten and the cannon fired outside the church during service.

Mr. Gerard disclaims original research, saying that he has mentioned little that is not found in the antiquarian researches of the society, and especially of Dr. O'Callaghan, but he has brought the material conveniently together, and has made an exceedingly interesting paper. It is the study of such material, with his sense of humor and his kindly nature, which gave us Washington Irving's *Knickerbocker's History*, which is in many ways the most original and characteristic of his works. Nothing remains of the New Amsterdam which he so happily described, and which Mr. Gerard's paper again restores to us, but the little slender cion of the pear-tree that grew in the bouvery, or farm, of Governor Stuyvesant, and which is perishing at the corner of the Third Avenue and Thirteenth Street.

Editor's Literary Record.

HISTORY AND TRAVELS.

MR. MOTLEY'S *Life of John of Barneveld*, two volumes (Harper and Brothers), is a history in the form of biography. Mr. Motley is a believer in the doctrine that men make the world; that history is not exclusively, or even chiefly, an unfolding of general laws, but a picture of personal life, and a measurement of personal influence. His history of Holland and the Dutch Republic is, therefore, largely written in lives of William the Silent and John of Barneveld. He believes in heroes, though not a hero worshiper,

and he makes good selection of his heroes. A historian of the type of Froude and Carlyle—less dramatic than the former, less opinionated than the latter—he is more trustworthy than either. His indefatigable industry has brought to light much new and interesting information respecting the period of which he treats, but his abundant resources have overburdened him, and overburden his pages, and a more careful sifting of materials, and a more concise summary of documents quoted in full, would have produced a work more valuable to the general read-

er, though perhaps less useful to the historical student.

Arctic Experiences: containing Captain George E. Tyson's wonderful Drift on the Ice-Floe, a History of the Polaris Expedition, the Cruise of the Tigress, and Rescue of the Polaris Survivors. To which is added a general Arctic Chronology. Edited by E. VALE BLAKE. (Harper and Brothers.) If this contained simply the narrative of Captain Tyson's drifting on an ice-floe for seven months and a half, it would be a memorable work, having large claims upon the reading public. This remarkable journey was the most dramatic event of the *Polaris* expedition. Yet this recital occupies little more than one-fourth of the work under our notice. The inside history of the entire expedition is given from its inception in July, 1870, until the return of the *Polaris* survivors in October, 1873. Nor is this all. The work opens with a comprehensive and exceedingly valuable summary of arctic exploration and discovery. This is followed by a very interesting chapter relating to Captain Tyson's whaling experiences before he was appointed assistant navigator of the *Polaris*. A subsequent chapter gives a biographical sketch of Captain Hall up to the date of the *Polaris* expedition. His connection with that expedition, until his melancholy end, is traced with especial care, and no reader can fail to be impressed with the story of this brave man's last days, or can turn away without a feeling of sorrowful regard from his desolate grave on that remote arctic coast. A very complete arctic chronology concludes the body of the work, which is profusely and beautifully illustrated with new engravings.

Professor WILLIAM G. SUMNER, of Yale College, is admirably adapted to the work of preparing *A History of American Currency* (Henry Holt and Co.). The financial dangers of the American people arise rather from ignorance and indifference than from any willfulness of judgment. We are without financial leaders, and are gradually learning that for the conduct of a republic popular knowledge of at least the fundamental principles of national finance is essential. Professor Sumner exhibits in his classes a peculiar power of awakening enthusiasm in the study of what is generally considered a very dry subject. The clearness, the directness, and the absence of professionalism which are manifested in this book interpret his success in the lecture-room. The history of American currency, beginning with the Wampumpeag currency of beads, is in his hands as interesting as that of any other department of national life; and the argument of experience for real money is all the more effective because he is content to trace the historical result of attempting substitutes, and, in the main, to leave these results to produce their own impression on the mind of the reader.

Niebuhr said he would give half his fortune to the man who could find a clew to the Etruscan language, and this clew Rev. ISAAC TAYLOR, a vicar in the English Episcopal Church, claims to have discovered, and to set forth in his *Etruscan Researches* (Macmillan and Co.). It would require an archaeological knowledge and experience to which this critic lays no claim to pass a trustworthy judgment on Mr. Taylor's discovery. No one, indeed, but a specialist could do this;

and even specialists might well require some further testing of the clew, and some further investigations, before rendering their judgment. But it is certain that to the scholar this book is one of very considerable value, as a contribution toward the solution of the mystery which has hitherto enveloped this people, and as a help to a correct understanding of the early history of Italy, while to the unscholastic reader it opens a chapter of history which is full of curious interest, and of which Mr. Taylor has written in a style which, considering his subject, is singularly free from needless scholasticism.

With Mr. Taylor's volume might be read to advantage *The Ancient City*, by F. DE COURCELLES (Lec and Shepard). This work, having passed through several editions in Paris, is here given to the American reader in an English dress. Its name is an inadequate suggestion of its character. Its sub-title better describes it, "A Study on the Religion, Laws, and Institutions of Greece and Rome." It is divided into five books, which treat respectively of ancient beliefs; the family; the city, embracing municipal government and the relations of the individual to law; revolutions, embracing an account of the political and social changes in both Greece and Rome; and the disappearance of the municipal régime. It is thus a comprehensive and convenient résumé of the social and political character of these two great nationalities. It appears to us, indeed, that the author falls into a common error of writers on this subject. He does not discriminate between imagination and belief, and transforms what were in many cases only fancies, or at best shadowy faiths, into definite and well-systematized creeds. The characteristic of modern thought, which demands a reason for every thing and places every thing in reason, was unknown outside a few scholastic circles. No clear line was drawn between poetry and philosophy; and hence every attempt to translate the dreams of that age of dreams into the clear and sharply cut analytical forms of modern thought is always, and of necessity, a pre-ordained failure.

RELIGION AND THEOLOGY.

AMONG the many works of a similar nature which have been recently published, *The Life of Christ*, by FREDERIC W. FARRAR, D.D. (E. P. Dutton and Co.), deserves a prominent place. It is a work for which the author's previous studies, as well as his special preparations, have peculiarly fitted him. He has visited in person the Holy Land, and his graphic descriptions of scenery, more simple but also more truthful than those of Renan, add greatly to the interest as well as to the value of his work. He has acquainted himself by original investigation with ancient rabbinical literature, and if his knowledge of classic life is less manifest and less minute than that of the French historian, his familiarity with Jewish legend and literature is more apparent, if not more thorough. He combines something of the warmth of Dr. Hanna with a minuteness of scholarship which the latter lacks. He does not turn aside from the course of the narrative to enter into controversies with theological or rationalistic opponents, nor generally encumber his pages with discussions respecting doubtful questions in learning, chronology, and geogra-

phy. The minuteness of his historical information does indeed sometimes burden his pages. This is painfully the case in his chapter on the Crucifixion, where he falls into an error analogous to that of the early painters: he depicts all the horrors of a scene of barbaric cruelty, without the power to portray the Divinity which triumphed in and over it. He occasionally accepts hypotheses unnecessarily complicated in order to reconcile real or seeming discrepancies in the accounts of the four Evangelists, as in his theory of a threefold trial of Christ before the Jews—one related alone by John, one by Matthew and Mark, and one by Luke. Occasionally we dissent from his conclusions, and his reasonings even seem to us lame and inconsequential, as is the case in his *excursus* on the question, Was the Last Supper an actual Passover? But in no case do we detect evidence of carelessness, indifference, haste, or slovenly writing; in none a lack of true reverence, or an interjection of theological or sectarian prejudice; in none any sign of cant or conventionalism. Less historically instructive than Abbott's *Jesus of Nazareth* or Smith's *New Testament History*, less minute in its scholarship than Ellicott's *Life of our Lord*, less valuable to the controversialist than Neander's *Life of Christ*, less poetic and spiritually suggestive than Beecher's *Life of Jesus*, with less of direct practical application of truth than Hanna's *Life of Christ*, less pictorial than Renan's *Life of Jesus*, it combines in an eminent degree qualities which will make it interesting to the general reader and valuable to the Scripture student.

To the work of debating before thoughtful minds the religious questions which modern thought has raised, Professor CHRISTLIEB declares to us in a private note that he has given his life. His *Modern Doubt and Christian Belief* (Scribner, Armstrong, and Co.) is fittingly described in its title as "addressed to earnest seekers after truth." Only "earnest seekers" will be likely to read it; but they will find it full of riches. Dr. Christlieb's training has been an apt preparation for the discussion of such themes before an English-speaking audience. His first important parish was in London; his first important work was a discussion of modern problems before audiences of young men there gathered. His sympathies with all that is broad and liberal in spirit are as undisguised as his faith in the fundamental tenets of Christianity as held by all Protestant churches. He is at once catholic and evangelical; and he was the most prominent and popular of all foreign delegates at the late meeting of the Evangelical Alliance, chiefly because his orthodoxy was so catholic, and because underlying his belief was a spirit which gave a breath of life to his theology. Those whose time does not permit, or whose inclinations do not prompt to, a full and careful study of his lectures will get at their gist and spirit in his smaller treatise on *The best Methods of Counteracting Infidelity* (Harper and Brothers).

We have two attempts to explain the nature, and to some extent to counteract the supposed errors, of Darwinism: the first, *What is Darwinism?* by Professor CHARLES HODGE, of Princeton (Scribner, Armstrong, and Co.); the second, *The Doctrine of Evolution*, by ALEXANDER WINCHELL, of Syracuse University (Harper and

Brothers). A brief, comprehensive, and popular treatise, written in answer to the question, What is Darwinism? is really a desideratum in literature. This Dr. Hodge has not given. He has, indeed, embodied in six propositions what is a very fair statement of Darwinism as he, Dr. Hodge, understands it; but the greater part of his treatise is devoted to a refutation of it, on the ground that it is atheistic, if not in the statements of its advocates, at least in its tendencies and results. Theological arguments have not thus far done much to throw light on scientific theories, and the chief value of such a treatise is to set forth certain principles, whose basis is in the intuitions, whose truth can not be successfully impugned by scientific hypotheses, and whose nature, therefore, limits the domain of true scientific imagination, the field within which investigators may look for their interpretation of the facts of nature. The other volume, that of Professor Winchell, is purely scientific in its nature. His avowed object is neither "to defend nor attack the doctrine [of evolution] under any of its forms, but rather candidly to exhibit to the inquirer its strongest defenses and its weakest points." He reaches, however, substantially the same practical conclusion, namely, that existing phenomena can not be accounted for without admitting the agency of a supreme and intelligent control; that is, that evolution is not atheistic, or atheistic evolution—evolution as a substitute for God—is not scientific.

Old Wells Dug Out (Harper and Brothers) is the characteristic title of Rev. T. DE WITT TALMAGE's last volume of sermons. Its significance Mr. Talmage thus interprets: "This book takes its title not more from the first sermon than from the fact that it is an attempt to re-open the old fountains of the Gospel, which have of late years been partially filled up." The title at once describes the characteristic feature of Mr. Talmage's ministry, and interprets his wonderful success. He sets forth old truths in new forms, and thus at once secures the ear of the modern auditor, and the approbation of the more conservative defenders of the faith.

FICTION.

CRITICS have had much to say recently against novels "with a purpose." We have no space for a general consideration of the subject. But it seems to us that this class of novels bears the same relation to that class in which are to be included George Eliot's *Romola*, Hawthorne's best stories, some of William Black's, and Auerbach's *On the Heights*, which the mechanic arts bear to the fine arts. And as in ordinary house-building there may be borrowed much from the highest architecture, both as regards form and embellishment, so the best novels "with a purpose" do bring to their aid the mastery of elements which characterize the highest order of fiction. When this happens, a higher æsthetic purpose blends with the mechanical aim, and contributes to its success.

But whether an æsthetic purpose is served or no, one thing is absolutely essential to the popularity of a novel—it must be interesting as a story. In *Fettered for Life* (Sheldon and Co.) Mrs. LILY DEVEREAUX BLAKE has met this requirement. The purpose of this novel is to impress upon its readers the necessity of independence to

the development of true womanhood. The style is spirited, and the plot so interesting to the average novel-reader that the story will be popular, whatever the critics may have to say about the plausibility of the most important incidents related. The novel is made especially piquant through the disguised sex of one of its principal characters.

Another recent novel with a purpose (by which we mean a design distinct and separate from both an ideal motive and the desire to please the reader) is *Papa's Own Girl*, by MARIE HOWLAND (John P. Jewett and Co.). No novel has yet appeared so comprehensive in its range, bearing upon the great social questions of the day: the position of woman and the conditions of labor. Its publication is very timely now, when the long-continued agitation of these topics has rendered it desirable that the problems involved should be clearly presented, and their possible solution indicated from the most hopeful point of view. Mrs. Howland has done this in a novel whose dramatic interest rises to the height of her main purpose. This interest depends upon no sensational incident, but upon the quiet development of the characters of the story. This development is on the whole natural, though in some particulars it invites criticism. The character of Dr. Delano, for instance, will puzzle the reader, because it is impossible to harmonize absolutely contradictory elements. We are forced to believe that Dr. Delano must have played a part in loving the noble and beautiful Clara, since there is no other explanation of his fascination after marriage by an ignoble and openly designing flirt. The faults, exhibited by the noblest characters in the story—as where Dr. Forrest meanly taunts his wife, or where Clara treats her husband domineeringly—may be readily excused, as we find in daily life just such blemishes upon characters that are otherwise of almost ideal loveliness. Mrs. Howland's style is felicitous though not elaborate—not sufficiently so, perhaps. Her delineation of character is marked by the utmost delicacy of treatment, with frequent touches of humor. But it is the great argument of the story, with its glorious forecast of the future, that will most impress thoughtful readers—and it is for these that the author has written. Here she rises to the poet's height—the poet of Tennyson's conception, who

“sings of what the world will be
When the years have died away.”

There are those who will bring against some portions of the novel the same objections that were brought against Wilkie Collins's *New Magdalen*, the same that the Pharisees of old brought against Him whose indignation was hurled not at the unfortunate woman, but rather at her accusers.

In AUERBACH'S *Waldfried* (Henry Holt and Co.) we find a novel of a very different type. Auerbach and Dickens are the antipodes each of the other. The former lifts us above the dusty turmoil and trouble of the world into a region of repose and strength. He must be read slowly, and more than any other modern novelist does he demand the passive submission of the reader's mind to his own. Those who read *Waldfried* for the sake of the story, or as they read novels generally, will be disappointed. The author's purpose is wholly philosophical.

In *On the Heights* Auerbach had also a philosophical purpose—to show the extent, through inevitable sequences, of a wrong done by two individuals, not against nature, indeed, but against society; and the expiation of this wrong by the king in one way and by the Countess Irma in another. But the story was cast in a popular shape. Not so in *Waldfried*, which is the diary of an old man, a resident of one of the South German provinces. The purpose of the story is to show the importance and profound influence of the state as related to the life of the individual and the family. This is effectively represented in connection with the series of events which culminated in the unity of Germany. The culture, mental and moral, of Waldfried's family is the result of civilization, but civilization in that special shaping which has been given it by the state. In Waldfried himself we have at once the expression of patriotic submission and of patriotic resistance—for he was one of the revolutionists of 1848. Herr Funk, the fawning demagogue, is introduced to serve as a foil to Waldfried. In Waldfried's wife we see the matronly dignity and majesty of womanhood in its highest German development. Martella, the pure-hearted child of the woods, the betrothed of Waldfried's wayward son Ernst, affords a suggestive contrast, brought directly as she is from the forest into intimate association with the members of Waldfried's family. Auerbach delights in these contrasts. Such a one was the introduction of the peasant woman Walpurga into the court as nurse to the crown prince, in *On the Heights*. Waldfried's eldest son, Ludwig, who returns home after a long residence in the United States, represents the influence of another national form upon the individual development. There is very little incident—i. e., of extraordinary incident—in the story until near its conclusion. Ernst's desertion (as significant in its right as in its wrong), the death of Waldfried's wife, the impulsive attachment conceived by Richard Waldfried for Martella—these are all, until the tumultuous drama of the battle-field sweeps over the stage, carrying away Ernst and Martella from our view, and ushering in the German Empire. Yet every page awakens thought. The significance of the two recent German wars is more deeply impressed upon the reader by this novel than it would be by the most minute history of those events. The novel awakens not thought alone, but feeling also. But the feeling is born in the reader's own soul. It is not made for him or imposed upon him by the expression of the writer's feeling. Thus, in his grand simplicity, Auerbach ranks with the great masters of expression in the other arts.

Colonel Dacre (Harper and Brothers) teaches the integrity and nobility of true love, its fidelity, its honor, its steadfastness. To the author or authoress love is neither a sighing sentiment nor a transient passion, but partakes something of the unchangeable nature of the Divine Being, whose character earthly love interprets to us. The story is, indeed, a love-story of the best description, and its teaching is not needless in an age when novels so frequently, not to say generally, substitute romance for reality, and a holiday courtship for a true and abiding love. If we measure *Colonel Dacre* first by its teaching,

this is not at all because it is a didactic novel. It is, on the contrary, characteristically dramatic. The reader is left, as he should be, to discern the moral for himself, as we are left to learn for ourselves the morals which life, the great parable, has for us. The plot is ingenious, and ingeniously and carefully worked out. The characters are so drawn that our interest in the story depends not upon the evolution of the plot, but upon the personages themselves. We are interested in them as in new acquaintances to whom we have been introduced in social life, and whose moral nature has drawn us to them. From all which the reader may judge, and not unjustly, that we account *Colonel Dacre* a superior novel.

Bed-Time Stories would have led us to look with anticipations of pleasure for any thing from the pen of LOUISE CHANDLER MOULTON, but we own to a surprised pleasure in reading *Some Women's Hearts* (Roberts Brothers). It is a small volume, and contains eight short stories, of a cast which we rarely light upon in book or periodical. There is no curious invention, no ingenious structure of story, no startling adventure, nothing unlikelike in form or in spirit, nothing to take the thought and heart from the quiet power and beauty of the emotional life—the heart life—which animates these simple tales. The English is as pure and simple as the sentiments of which it is the expression. And the characters are at once true to nature, not always as it really is, sometimes at least as we would have it to be, without being conventional or commonplace. There is not the least apparent laboring for effect; none of that studied smartness which is the bane of most of our popular American story writers; none of the tinsel and glitter that belong of right to the stage, but often obtrude, in both dress and literature, into the parlor.

F. W. ROBINSON is one of the "cleverest" of English novelists, and just escapes the right to
